alienation. Included is a large compilation of Soviet literature of the psychology of thinking and speech, excluding, however, studies in the psychology of child speech, defectology, and the pathology of thinking and speech. (18 ref.).—*J. D. London.*

4885. Benson, Purnell H. (Rutgers State U., Graduate School of Business Administration) **Segmentation analysis of media exposure: Towards a theory of learning opportunity.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 661-662. Applies latent structure analysis, originated by P. Lazarsfeld, to the problem of describing segments in media audiences and estimating their probabilities of exposure. Data from 9 TV shows and 2 magazines are examined and latent segments are defined. The equations defining the sizes of the segments and the exposure probabilities are written in terms of the expansion of binomial probabilities. Exploratory results indicate the feasibility of applying latent structure analysis to media audiences. The generation of a large system of equations with many advertising vehicles and many segments may facilitate the projection of media schedules from limited survey input to many exposure opportunities, but this possibility remains to be explored.—*Author abstract.*

4886. Berg, Meredith W. & Berg, David M. (Valparaiso U.) **The rhetoric of war preparation: The New York press in 1898.** *Journalism Quarterly*, 1968(Win), Vol. 45(4), 653-660.—2 brothers, a historian and rhetorician, synthesize their interests in focusing on the process of psychological preparation for war, as demonstrated in New York papers after sinking of the "Maine."—*Journal abstract.*

4887. Booth, Alan. (U. Nebraska) **The recall of news items.** *Public Opinion Quarterly*, 1970-1971(Win), Vol. 34(4), 604-610.—Based on the recall of items presented on radio and TV and in newspapers, it is suggested that "broadcasters and publishers have the ability to manipulate news consumption." This is accomplished by "altering the frequency, time, space, location, and pictorial content in their presentation of news events"—*A. R. Howard.*

4888. Brinkman, Del. (Kansas State U.) **Do editorial cartoons and editorials change opinions?** *Journalism Quarterly*, 1968(Win), Vol. 45(4), 724-726.—This study of effects of editorials and editorial cartoons showed that cartoons presented with editorials will bring greater opinion change than an editorial alone or a cartoon alone. Order of presentation effects, and 1-sided, 2-sided arguments effects were also found.—*J. A. Kline.*

4889. Chaffee, Steven H. & McLeod, Jack M. (U. Wisconsin) **Sensitization in panel design: A co-orientational experiment.** *Journalism Quarterly*, 1968(Win), Vol. 45(4), 661-669.—This study of "sensitization" in panels and before-after designs finds evidence that contamination occurs. It also yields support for some of its predictions based upon the coorientation model.—*Journal abstract.*

4890. Denis, Michel. (National Center of Scientific Research, Paris, France) **Un inventaire des principales variables a étudier en relation avec le problème de la compréhension d'un message narratif.** [An inventory of the principal variables to be studied in the comprehension of a narrated message.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6-8), 422-425.—A narrated message may be considered a dependent variable interacting with a number of independent variables

consisting of both genetic and psychological attributes of the S and those related to the stimulus itself. (18 ref.)—R. E. Smith.

4891. Gitter, A. George & Guichard, Michael. (Boston U.) **Looking behavior: First looker's direction and locus of gaze.** *CRC Report, Boston U.*, 1968(Jul), No. 23, 22 p.—Tested the effect of the presence of a 2nd looker on the perceived (a) direction of gaze, (b) focus of gaze, and (c) expression of emotion of the 1st looker. Ss were 200 undergraduates. Results indicate significant displacement of direction of gaze toward the 2nd looker, and higher frequency of perceived emotion and increased focus of gaze in the 2-looker situation. Female Ss perceived significantly more emotion than did male Ss.—*Journal abstract.*

4892. Heller, Melvin S. & Polsky, Samuel. (Temple U.) **Television violence: Guidelines for evaluation.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 279-285.—Reports an analysis of types, characteristics, and presentation of violence on TV. Possible effects on the individual personality of the viewer, particularly the child, are discussed. Suggestions are given for evaluating TV violence on the basis of its emotional impact rather than on changing social mores. It is suggested that fantasy and humor are general modifiers of relevant concern in the assessment or rating of TV violence. A practical checklist of additional rating factors might include apparent authenticity, bizarreness, bondage, conditioning or inuring, consequences, dehumanization, demonstration, and secret-conspiracy-mindedness. (30 ref.)—*Journal abstract.*

4893. Hogan, Robert & Henley, Nancy. **A test of the empathy-effective communication hypothesis.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Oct), No. 84, 21 p.—Examined the hypothesis that empathy or role-taking ability is important in the communication process because it enables a speaker to consider in advance the informational demands of his audience. In this study (a) empathy was measured by an objectively scored empathy scale, and (b) the communication process was represented by an encoding-decoding task (using abstract designs) to provide quantitative estimates of encoding and decoding ability. For 49 undergraduates, the average correlation between empathy and encoding skill was +.60, and the correlation between empathy and decoding was +.14. Results from a 2nd study with 48 undergraduates tend to confirm these findings. (19 ref.)—*Journal abstract.*

4894. Paisley, William J. & Parker, Edwin B. **Scientific information exchange at an interdisciplinary behavioral science convention.** *Report of the Institute for Communication Research, Stanford U.*, 1967(Mar), 46 p.—Examined the role of conventions in the information system of science. Questionnaires were mailed to the sociologists, political scientists, advertising researchers, psychologists, and journalists who attended the 1966 American Association for Public Opinion Research. 186 questionnaires were returned (78% response rate) containing information on (a) characteristics of the attendants—rank, education, research interests; (b) typical information behaviors—number of conventions attended, journals regularly read, input and output of writings; and (c) information exchange at the convention—session attendance, sources of 6 types of information, source and kind of most interesting and most useful information. 4 appendices are included

which contain the text of the questionnaire and responses, response tabulation against the characteristics of the attendants, comparison with American Psychological Association findings, and aggregate response patterns explored through factor and cluster analyses.—S. Knapp.

4895. Pool, Ithiel S., et al. (Massachusetts Inst. of Technology) **The prestige press: A comparative study of political symbols.** Cambridge, Mass.: Massachusetts Inst. of Technology Press, 1970. xxi, 359 p. \$12.50.

4896. Rees, Matilda B. & Paisley, William J. (Northwestern U.) **Social and psychological predictors of information seeking and media use.** *Report of the Institute for Communication Research, Stanford U.*, 1967(Sep), 107 p.—Presents data collected in California in 1965 from 1-hr interviews of 1294 Ss on media use and information seeking behaviors. 10 predictor variables (age, sex, occupation, income, marital status, number of organizational memberships, achievement motivation, perception of practical education in the media, and perception of positive consequences from new media and educational technology) were correlated with 25 media use and information seeking behaviors (16 uses of newspapers, magazines, radio, television, and books; 6 uses of adult education; specific information seeking in the media; interpersonal information seeking; and impersonal information seeking). Results are grouped for behaviors sharing the same strongest predictor and for behaviors predicted by groups of characteristics. Difficulties in the analysis of the data are described. The utility of the findings is discussed. (28 ref.)—S. Knapp.

4897. Schüller, Gabriella; Déval, Margit, & Kádár, Júlia. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A televízió hatása a gyermekekre.** [The effect of television on children.] *Psichológiai Tanulmányok*, 1968, No. 11, 257-268.—Reviews studies and recounts a survey based on questionnaires filled in by various groups. Data were processed with a view to assessing the positive and negative implication of TV for children. Data refer to the change in the life pattern due to TV watching, to the mental and physical stress watching involves, and to the extension of the S's horizon and field of interest. (Russian summary)—*English summary.*

4898. Sweeney, Donald R., Tintin, David C., & Schmale, Arthur H. (U. Rochester, Medical Center) **Dimensions of affective expression in four expressive modes.** *Behavioral Science*, 1970(Sep), Vol. 15(5), 393-407.—Compared dimensions of affect expression in 4 expressive modes. 20 21-58 yr. old artists, dancers, actors, and graduate students were asked, under light hypnosis or with relaxation instructions, to express several affects verbally, graphically, facially, and posturally. Verbal excerpts, drawings, movies of facial and postural expression, and affect labels and definitions ("theoretical" mode) were each exposed to groups of raters who evaluated the material using a "semantic differential" type instrument. Separate factor analyses of scale intercorrelations, followed by orthogonal rotation of factors, were performed on data from each expressive mode. Interpretable factors were generally similar across the modes. Accounting for the largest proportion of total variance were factors interpreted as activity and evaluation. Less salient but consistently appearing factors were interpreted as temporality and object-relatedness. Potency and spatial orientation factors were also identified in each mode. A factor tentatively called

containment emerged only in the analyses of data from nonverbal modes. Rank difference correlations of affect scores showed, in general, a high correspondence of affect ranks among modes, indicating high cross-modal similarity of affective meaning perceived in the complex rating material. Factors are discussed in terms of differences among modes, and comparison with previous literature is made. (50 ref.)—*Journal abstract.*

4899. Vítár, Zoltán. **A televíziózás néhány szociálpszichológiai vonatkozása.** [Some social-psychological implications of television watching.] *Psichológiai Tanulmányok*, 1968, No. 11, 111-124.—In the 1st part of the study some of the scientific approaches to the examination of TV and its influence are reviewed. These include statistical, sociological, educational, aesthetic, psychological, social-psychological, and complex studies. Subject matter and methods of a 1965 survey at 24 villages including 2344 persons are recounted. The survey was part of the joint Czechoslovakian-Hungarian Television Influence Survey initiated by the Budapest and Bratislava Institute of Public Education. In the 2nd part, data concerning the motives for watching TV, the disadvantages of watching, TV and the family, and TV and verbal communication are interpreted. In the 3rd part the need for further research is stressed and some perspectives outlined. (Russian summary) (28 ref.)—*English summary.*

Language

4900. Arnheim, Rudolf. (Harvard U., Carpenter Center for the Visual Arts) **Words in their place.** *Journal of Typographic Research*, 1970(Sum), Vol. 4(3), 199-212.—Discusses the relationship of language to thinking. It is suggested that although language helps thinking, it is not indispensable to thought and its structure or perceptual dimensions as a medium of thought are severely limited. What makes language valuable for thinking is our use of words to refer to other thought media, such as visual imagery. Not being restricted as language is to linearity, the visual medium offers structural equivalences to all characteristics of objects, events, relationships—in 2 and 3 dimensions. A literary image grows through accretion by amendment; a pictorial image presents itself whole, in simultaneity. (18 ref.)—*Journal abstract.*

4901. Chastain, Kenneth. (Purdue U.) **The audio-lingual habit theory versus the cognitive code-learning theory: Some theoretical considerations.** *IRAL: International Review of Applied Linguistics*, 1969(May), Vol. 7(2), 97-106. Examines the problems of what language is and how it is acquired from the viewpoint of cognitive code-learning and audiolingual habit theories. Verbal satiation, inductive vs. deductive material presentation, and transfer of learning across sense modalities are investigated as they pertain to mentalistic vs. mechanistic learning processes. It is concluded that present knowledge about learning and language teaching is not complete. (German & French abstracts)—*G. Steele.*

4902. Dixon, Theodore R. & Smith, Roger C. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) **Verbs as reinforcers: Does the impression value of verbs influence response choice in sentence generation tasks?** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 267-273. Investigated the effects of verb impression value upon verb and pronoun use in a sentence

generation task. Ss were 30 undergraduate volunteers in Exp. I, and 10 in Exp. II. Differences in pronoun and verb frequencies were found with presentation of 3 impression value types (good, neutral, and bad), while presentation of just 2 types within an S resulted in differences only between bad and good or neutral impression value verbs. It is concluded that the reinforcing properties of verbs may be dependent upon the types of impression value sampled.—*Author abstract.*

4903. Gall, Meredith D., Hobby, Amos K., & Craik, Kenneth H. (Far West Lab. for Education Research & Development, Hotel Claremont, Berkeley, Calif.) **Non-linguistic factors in oral language productivity.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 871-874.—Assesses individual differences in oral language productivity by word counts of Ss' spoken descriptions of 9 different visual displays. Ss were 20 male and 19 female 18-30 yr. old undergraduates. Women attained higher word counts than men in 8 of their 9 descriptions, in 3 instances to a statistically significant extent. Individual differences in oral language productivity showed a moderately high degree of stability across situations. The pattern of correlations between oral language productivity and personality variables differed in the samples of men and women. The sex-specific and situation-specific role of personality variables in oral language productivity is illustrated and discussed.—*Journal abstract.*

4905. Pavan, Luigi. (U. Padua, Clinic for Mental & Nervous Diseases, Italy) **Considerazioni sull'importanza della linguistica in alcuni orientamenti psicanalitici, in particolare nell'opera di Jacques Lacan.** [Considerations on the importance of linguistics in some psychoanalytical orientations, in particular in the work of Jacques Lacan.] *Rivista di Psichiatria*, 1970(Mar), Vol. 5(2), 81-96. Reviewed structural linguistic principles and the fact that such principles are not limited to the field of linguistics, but to other human sciences as well. Jacques Lacan's work gives a new interpretation to Freud and notwithstanding the possibility of being criticized, he contributes in bringing psychoanalysis closer to contemporary, controversial problems. The symbol, to Lacan, is a structure inherent to the language, and so the phenomena of what is symbolic are structured like a language. It is not a symbolism in which there is a relationship between symbol and that which it represents, as in Freud; for Lacan it is the structure of the symbolic system which is primary. (English summary) (37 ref.)—*A. M. Farfaglia.*

4906. Peterfalvi, Jean M. (Sorbonne, Paris, France) **Recherches expérimentales sur le symbolisme phonétique.** [Experimental research on phonetic symbolism.] *Monographies Françaises de Psychologie*, 1970, No. 19, 174 p.—Investigates phonetic symbolism as a motivated, nonarbitrary aspect of language in the framework of synesthetic relationships. In a series of studies, synesthetic relationships were found between nonsense words and meaningful words, between visual configurations and meaningful words, and between nonsense words and visual configurations. Figural symbolism is interpreted as being closely tied with phonetic symbolism, both being special cases of synesthesia with some cross-cultural generality. Manifest-

tations and role of phonetic symbolism in natural languages, including in artistic expression, are discussed. (97 ref.)—S. Slak.

4907. Prytulak, Lubomir S. (U. Western Ontario, London, Canada) **Natural language mediation. Cognitive Psychology**, 1971(Jan), Vol. 2(1), 1-56.—"Natural language mediation" (NLM) refers to the covert process by which an English-speaking S encodes an unfamiliar stimulus into English, and then decodes the NLM back to its original form. To externalize this process, Ss were required to write NLMs to CVC stimuli, then reconstruct the original stimulus. S was hypothesized to work sequentially through a stack of transformations (T stack), e.g., deletions, substitutions, etc., until someone succeeded in turning the CVC into a familiar word. The T stack model predicted free-association response measures of latency and probability. The nature of intrusion errors, and learning rate in paired-associate learning, as well as pronounceability ratings were also successfully predicted. Elaboration into a memory model suggests that successful retrieval required storage of an NLM plus T package. NLM was independent of stimulus characteristics while T retention was poor for low-meaningfulness stimuli, probably due to the large number of operations in T for such stimuli. (2 p. ref.)—H. W. Hamilton.

4908. Rommetveit, Ragnar. (U. Oslo, Psychological Inst., Norway) **Psychological studies of words. Nordisk Psykologi**, 1969, Vol. 21(1-2), 16-27.—Examined words as they emerge in acts of decoding and encoding. The word is a hierarchially organized psychological process. This may be schematically visualized as a complex test-operate-test-exist (TOTE) mechanism. A schematic 3-component model of word meaning is proposed: an initial process of reference is assumed to branch off into sustained representation, affecting and affected by an associative and an affective activity. Some research evidence is supplied. Tentative evidence concerning components of word meaning stems mainly from studies of the isolated word in the psychological laboratory. Apart from such meaning potentialities which are assessed by requests for definition, word-association tasks, and semantic differential measurements only a fraction appear to be operant in any particular context; there is very often a proactive constraint upon processing and, in other cases, some retroactive process is obviously required. Psychological studies of words qua complex cognitive-perceptual-motor processes help to understand how an infinite variety of messages can be transmitted by temporal chains of a very limited number of speech sounds.—P. Mylov.

4909. Smith, O. W., Koutstaal, C. W., & Kepke, A. N. (Bowling Green State U.) **Relation of language distance to learning to pronounce Greenberg and Jenkin's List I CCVCs. Perceptual & Motor Skills**, 1969(Dec), Vol. 29(3), 868-870.—J. H. Greenberg and J. J. Jenkins' language substitution (S) and values for their List I CCVCs were hypothesized to correlate significantly with 4 measures related to the acquisition of the correct pronunciation of the CCVCs by 30 graduate students. Mean scale values were computed for each CCVC for each of the 4 measures. The range of correlations of the 4 sets of scale values with corresponding S and language distance values is .71-.97 (disregarding sign), with the median at .89. The hypothesis remains tenable.—*Journal abstract*.

4910. Walker, Robert V. & Chalmers, Douglas K. (U. California, School of Social Science, Irvine) **The use of technical and nontechnical language in communication. Journal of Psychology**, 1971(May), Vol. 78(1), 65-71.—Conducted 2 experiments to study the difference between technical and nontechnical language, and its relation to variations in the status of the communicator (student vs. dentist) and the amount of information in the communication. Exp. I demonstrated that under conditions of relatively low information in the communication, technical language produced a more favorable effect than nontechnical language. Also, the hypothesis that technical language operates to confer increased status on the communicator was not supported. In Exp. II, it was hypothesized that while technical language would produce more favorable effects than nontechnical language when the communications contained little information (as in Exp. I), technical language would produce less favorable effects than nontechnical language when the communications contained a large amount of information. This "information complexity" hypothesis was confirmed. Hence the simple message was most effective with technical language, whereas the complex message was most effective with clear and simple language.—*Author abstract*.

Psycholinguistics

4911. Hebb, D. O., Lambert, W. E., & Tucker, G. R. (McGill U., Montreal, Quebec, Canada) **Language, thought and experience. Modern Language Journal**, 1971(Apr), Vol. 55(4), 212-222.—Examines the nativism that is evident in psycholinguistics today, and proposes a more moderate view in which learning cooperates with heredity in the child's mastery of language. The dominant view in psycholinguistics seems to be that learning is not involved in the acquisition of grammatical competence; it is argued instead that the essential principles of grammar are unlearned and somehow transmitted by heredity. In response to this position, learning is taken to be as much determined by the learner's heredity as by his environment. Experience has an essential part in the development of any cognitive process, including those processes that control language, but this in no way decreases the overriding importance of hereditary predispositions. It is clear that man is born to talk, innately provided both with the capacity and with a motivation, almost a need, to learn, at least in the case of native language. In behavior, to separate the innate from the acquired depends on perception and thought; the relation of constitution to experience is multiplicative rather than additive. Both heredity and environment are of importance, even when one is a greater source of variance than the other, and their relation is such that one must understand both to understand either. This approach to such diverse aspects of language learning and language behavior offers a productive alternative to the now polarized positions taken by the nativists and the empiricists in psycholinguistics. (36 ref.)—LLBA.

4912. Mountford, John. (La Sainte Union Coll. of Education, Southampton, England) **Some psycholinguistic components of initial standard literacy. Journal of Typographic Research**, 1970(Fal), Vol. 4(4), 295-306.—Initial standard literacy is considered to be a more adequate term for what is commonly called the teaching of reading. 5 psycholinguistic components are suggested: (a) knowledge of a standard language, (b)

knowledge of its standard orthography (distinguished from other kinds of writing-systems), (c) "technical concepts" of literacy, (d) "habitudes" of literacy, and (e) basic skills of literacy (reading and writing). Literacy is also predicated of societies. The study of it, both as a psycholinguistic phenomenon and as a sociolinguistic phenomenon has been neglected in linguistics generally, just as the concept of literacy has been neglected in educational theory.—*Journal abstract.*

4913. Smackey, Thelma R. & Beym, Richard. (Human Resources Research Office, Alexandria, Va.) **Tag questions: Dangerous psycholinguistic territory for TESOL.** *IRAL: International Review of Applied Linguistics*, 1969(May), Vol. 7(2), 107-115.—Examines the emotional qualities and attitudinal meanings conveyed in tag questions in 2 experiments using 53 native speaking undergraduates and 59 22-44 yr. old professionals to determine "the psycholinguistic dangers involved in teaching tag questions to foreign students." Results indicate: (a) "tag questions are complex psycholinguistic phenomena," (b) there are 2 standard variations in final intonational contours which convey a yes-no question or an assertion, and (c) variations in individual voice qualities and intonational contours convey a wide range of attitudinal meanings and emotional qualities. It is concluded that the tag question is an inappropriate pattern to teach to elementary or intermediate foreign students "who still have a strong tendency to superimpose their native intonations," and should only be taught to advanced foreign students within their given sociopsychological contexts. (French & German abstracts)—*G. Steele.*

AESTHETICS

4914. Brivic, Sheldon R. (U. California, Berkeley) **James Joyce from Stephen to Bloom: A psychoanalytic study.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3539-3540.

4915. Doederlein, Sue W. (Northwestern U.) **A compendium of wit: The psychological vocabulary of John Dryden's literary criticism.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3542.

4916. Gál, Judit Cs. **A zenei ízlésvizsgálatok metodológiai kérdése.** [Methodological problems of investigating into taste in music.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 335-357.—Discusses how taste in music can be examined with exact psychological methods, without curtailing the aesthetic qualities of music. Taste is approached from the aspect of actions, and the unity of emotional and intellectual spheres in the various manifestations of taste is emphasized. Accordingly problems relating to taste should be examined both on the levels of emotional identification with, and awareness of, certain elements in music. The fundamental question of an appropriate method for the psychological research of taste in music is determined by the fact that in cognition the subject is the composition itself. Since the particular qualities of any composition can be assessed by analytic means, the research data can be brought into comparison with these objective criteria. It is theorized that the fundamental category of taste is the presence of something that is pleasing. This can be studied in situations of action, by sampling. The various items of music offered for choice must have some intrinsic, substantial similarities, modified only by a few variations. If this is missing, the pleasing factor cannot

be interpreted. The possibility of investigating the process of making meaning conscious as well as the way of assuming a determined position in reference to the musical matter are considered. Methods of examining various tastes are reported. The variables were either items of music, single motifs, or different kinds of action for the S to perform. (Russian summary) (30 ref.)—*English summary.*

4917. Halász, László. (Hungarian Academy of Sciences, Psychology Inst., Budapest) **Módszertani problémák az irodalmi alkotómunka és befogadás pszichológiai vizsgálatában.** [Methodological problems in the psychological study of literary creativity and receptivity.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 319-333.—Reviews the possibilities of an empirical approach to problems of creativity and receptivity and describes various research methods, i.e., having compositions written on experimental subjects, psychological analysis based on indirect observation, and analogic experiments. It is shown how to conduct psychophysiological experiments, how to use a combination of interview and attitude scale in psychology of art, and how to deal with problems concerned with goals and procedures. Experimental psychology is considered to have a fair chance of success in approaching the singularly complicated psychological problems of literature, i.e., the branch of art which is most closely connected with social consciousness and social ideology. (Russian summary) (18 ref.)—*English summary.*

4918. Pawłowski, Tadeusz. (U. Łódź, Poland) **Piękno i jego społeczno-psychologiczne uwarunkowania.** [The concept of beauty and its social-psychological conditioning.] *Studia Filozoficzne*, 1970, No. 4-5, 141-157.—An aesthetic experience is related in a complex manner to cultural, cognitive, biological, perceptual, and situational factors. A conflict exists between those who consider aesthetic judgments as subjective, individual, and variable, and those who classify them as objective and fairly permanent, resulting from properties and characteristics of the work of art. Attempts to formulate an objective definition of aesthetic values are unsuccessful, since elements of comparison and interpretation always influence aesthetic judgments. No definition of beauty can be complete enough to include popular concepts as well as individual judgments, including the opinion of experts and laymen. Axiological premises play a basic role.—*H. W. Temmer.*

4919. Razran, G. (Queens Coll., City U., New York) **Vysshaya nervnaya deyatel'nost' i dinamika esteticheskikh perezhivanií i vospriyatíi: Eksperimental'noe issledovanie.** [Higher nervous activity and the dynamics of esthetic experience and perception: An experimental investigation.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 384-396.—24 short unfamiliar musical selections (45-60 sec.) and 24 colored slides of unfamiliar paintings were presented to 378 artistically unsophisticated adults for ratings under a number of conditions (repetition 4, 8, and 12 times; similarly during a selected lunch; similarly after missing lunch). Another group of 42 Ss, exposed to 2 music and 2 art items, was utilized to procure ratings and measurements of conditioned salivation. Ratings were also procured from a group of 5 expert musicians and 4 expert painters. The evidence was clear-cut in demonstrating that music and art items, presented during lunch, gained positive and lost negative affectivity. There was some evidence that,

when the Ss were hungry, positive affectivity declined and negative affectivity increased. Conditioned salivation was also demonstrated. Repetition by itself had both lesser and more variable effects of affectivity with respect to the selections. The results on the development of taste or "esthetic veridicality" were novel, with repetition alone increasing veridicality much more than did repeated presentations during eating or in mild states of hunger. It is suggested that the dynamics of esthetic perception of complex stimuli is essentially an "autochthony of self-reinforcing integrations and differentiations, which may be disrupted or encumbered by interactions with external associative or conditioning agents." (English summary) (25 ref.)—*I. D. London.*

4920. Sapalala, Paz E. (U. Minnesota) **Renaissance psychology and the plays of Thomas Middleton.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3519.

4921. Zurabashvili, A. D. Shota Rustaveli, Nikoloz Baratashvili, Vazha Pshavela: **Psikhologicheskii ocherk.** [Shota Rustaveli, Nikoloz Baratashvili, Vazha Pshavela: A psychological essay.] Tbilisi, USSR: Merani, 1970. 136 p.—Treats from the viewpoint of personological psychology a number of important problems encountered in the creative works of the Georgian writers, Rustaveli, Baratashvili, and Pshavela and in those of Shakespear, Goethe, Schiller, and Dostoevski. An attempt is made to show that "any literary production is a major academic interest to psychology, psychopathology, and psychoneurology as a whole." A chapter on the pivotal problems of personology introduces the 5 subsequent chapters, 4 of which are devoted to psychological analyses of the Georgian writers. (English summary)—*I. D. London.*

SMOKING & DRUG & ALCOHOL USE

4922. Brill, Norman Q., Crumpton, Evelyn, & Grayson, Harry M. (U. California, Medical School, Los Angeles) **Personality factors in marihuana use.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 163-165.—Investigated the relationship of some personality factors to extent of marihuana use in young college students. 79 marihuana users differing in extent of use (from less 1/mo to almost every day) were compared with 2 control groups of 20 Ss each on 4 MMPI scales, a risk-taking propensity scale, a stimulus-seeking scale, 9 specially constructed items, and a number of demographic variables. More frequent use of marihuana was significantly related to higher scores on the stimulus-seeking scale, on the MMPI Psychopathic Deviant Scale and to "true" responses to the items, "a person should not be punished for breaking a law that he thinks is unreasonable" and "as long as I can remember, I have had more emotional problems than other people." Regular use of marihuana was very significantly related to experimentation with other drugs. Hypotheses about impaired parental identification, goal-orientation, or the role of religion are not supported.—*Journal abstract.*

4923. Caffrey, Bernard; Belknap, Joseph J., & Kemmerlin, T. Larry. (Clemson U.) **Drug attitudes of ninth graders in the North and South.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 575-576.—Attitudes towards drugs were assessed in 65 Long Island 9th graders and 70 urban South Carolina students. Analysis of factor scores by a 2 x 2 analysis of variance indicated that Northern

students were less repressive toward drugs and drug users, and that male students were more liberal than female students. It is concluded that both region and sex influence the attitudes of high school students toward drugs, and that the student attitudes reflect a desire for a better understanding and control of the drug problem.—*Author abstract.*

4924. Clark, Walter H. & Funkhouser, G. Ray. **Physicians and researchers disagree on psychedelic drugs.** *Psychology Today*, 1970(Apr), Vol. 3(1), 48-50, 70-73.—Questionnaires were mailed to 302 researchers involved in work with drugs (44% returned) and to 1000 members of the American Psychological Association and 1230 members of the American Medical Association (24% returned). Overall, the researchers were more liberal than the other professionals and consistently viewed drugs as less dangerous. This set of findings supported the hypothesis that a knowledge gap exists between these 2 groups. The fact that nonresearchers tend to see only those having bad experiences with drugs may lie behind their attitudes.—*E. J. Posavac.*

4925. Green, Mary G., Blake, Brian F., Carboy, John J., & Zenhausern, Robert J. (Valley Stream Public Schools, N.Y.) **Personality characteristics of the middle class high school drug user.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 559-560.—A sample of students from a middle-class high school participated in a study to find the relationship between the student's use of drugs and his personality characteristics. Ss were administered the Cattell High School Personality Questionnaire and a modified version of the Eells survey of drug use. Compared to nonusers, drug users scored lower in frustration tolerance, self-sufficiency, and self-control, and higher in dominance and recklessness. These differences did not depend upon the student's academic capacity.—*Author abstract.*

4926. Haberman, Paul W. (Columbia U., School of Public Health & Administrative Medicine) **Denial of drinking in a household survey.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 710-717.—About 1/3 of a representative sample of New Yorkers denied drinking alcoholic beverages, a proportion considerably larger than that found in national surveys. More denial of drinking was found among older than younger respondents, the less-educated, Puerto Ricans, Italians, and Jews. It is suggested that younger Italians and Jews are not following traditional drinking patterns and that the older ones misinterpreted the question.—*Journal abstract.*

4927. Lichtenstein, Edward. (U. Oregon) **How to quit smoking.** *Psychology Today*, 1971(Jan), Vol. 4(8), 42-45.—There are few effective methods to help people stop smoking since most approaches cannot keep people from starting again after the program is over. The most effective method combines aversive conditioning, verbal social approval, and an expectation of success. For example, 1 study of 58 smokers showed that 34 were still off cigarettes 6 mo. after the program. It is necessary that smoking becomes nonrewarding and that people stop completely. Cutting down only enhances the rewarding nature of smoking and relapses are almost inevitable.—*E. J. Posavac.*

4928. Lilieblad, Bertil & Wolff, Bertil. **Narkotikamissbruk hos inskrivningskyldiga 1968/9: I. Bakgrund och uppläggning.** [Drug abuse among conscripts 1968/69: I. Background and design.] *MPI*

B-Rapport, 1969(Aug), No. 26, 16 p.—Investigated the use and abuse of narcotic drugs, alcohol, and tobacco among 18-yr-old conscripts. An anonymous questionnaire was completed by 23,305 Ss, 50% from large city areas, on their use of drugs and on social background, adaptation, and attitudes toward society. Data were collected in the fall of 1968 and in the spring of 1969. The initial dropout has been estimated at 3.5%.—*English summary*.

4929. Lilieblad, Bertil & Wolff, Bertil. **Narkotikamissbruk hos Inskrivningsskyldiga 1968/69: II. Geografisk redovisning.** [Drug abuse among conscripts 1968/69: II. Geographical description.] *MPI B-Rapport*, 1969(Aug), No. 27, 20 p.—Continues the study by B. Lilieblad and B. Wolff (see PA, Vol. 46:Issue 3) on drug use in the Swedish Army. Ss were 23,305 18-yr-old conscripts. It was found that 19–26% of Ss from large city areas had used narcotic drugs, while only 8–9% of Ss using drugs came from other areas. Of the drug experienced Ss (a) 58–73% had used marihuana 1–10 times, (b) 2–5% most often injected drugs, (c) marihuana was the 1st drug used for 77–89%, (d) amphetamine and similar drugs were the 1st drugs for 6–14%, (e) 41–53% last used drugs between July and December 1968, (f) 19–35% used drugs only once, (g) 11–21% used drugs more than 50 times, (h) marihuana was the favorite drug for 74–91%, (i) 3–7% had injected drugs once, (j) 4–8% had injected drugs more than once, (k) 79–87% said they had no need for drugs, and (l) 2% indicated a strong need for drugs. Of those Ss who had not tried drugs, 25–60% had 1 or more times been offered narcotic drugs.—*English summary*.

4930. Linsky, Arnold S. (U. New Hampshire) **The changing public views of alcoholism.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 692–704.—In a representative sample (N = 305) of the adult population in Vancouver, Washington, the younger, the better educated, and those with more exposure to mass media showed greater acceptance of social drinking, alcoholism, and medical and psychological treatment of alcoholism than did the other respondents, and were more likely to attribute alcoholism to psychological than to biological causes.—*Journal abstract*.

4931. McClelland, David C. (Harvard U.) **The power of positive drinking.** *Psychology Today*, 1971(Jan), Vol. 4(8), 40–41, 78–79.—TAT stories were given by college students before, during, and near the ends of parties. Alcoholic drinking (cocktails) increased power themes in the stories. Moderate drinking increased socialized power thoughts while heavy drinking increased personal dominance thoughts. Studies of fantasies from folk tales of several cultures supported these conclusions. Additional studies of older men suggested that the "excessive drinker... is the man with an excessive need for personal power who has chosen drinking as the way to accentuate his feelings of power." Attempts to use these findings in work with alcoholics is also described.—*E. J. Posavac*.

4932. Parry, Hugh J., Balter, Mitchell B., & Cisin, Ira H. (George Washington U., Social Research Group) **Primary levels of underreporting psychotropic drug use.** *Public Opinion Quarterly*, 1970–1971(Win), Vol. 34(4), 582–592.—Examines the validity of self-reporting the use of psychotropic or psychotherapeutic drugs in a sample known to have filled 1 or more relevant medical

prescriptions. Discusses factors related to invalid responses and presents comparative findings for antibiotic use.—*A. R. Howard*.

4933. Popoff, David. **Feedback on drugs.** *Psychology Today*, 1970(Apr), Vol. 3(11), 51–52.—The results of a readers' poll (14,748 respondents) concerning drugs indicated that tobacco was seen as considerably more dangerous than marihuana and slightly more dangerous than amphetamines. Even among nonusers very few would go to the police or a clergyman if he caught his children with marihuana or LSD. Among this self-selected sample, 62% favored making marihuana at least as available as alcohol but only 9% felt that way about LSD.—*E. J. Posavac*.

4934. Shetterly, Henry T. (U. Denver) **Self and social perceptions and personal characteristics of a group of suburban high school marijuana users.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3279.

4935. Wolff, Bertil; Netz, Björn, & Lilieblad, Bertil. **Narkotikamissbruk hos Inskrivningsskyldiga 1968/69: III. Missbruksvanor.** [Drug abuse among conscripts 1968/69: III. Drug habits.] *MPI B-Rapport*, 1969(Aug), No. 28, 22 p.—Continues the study by B. Lilieblad and B. Wolff (see PA, Vol. 46:Issue 3) on drug abuse in the Swedish Army. The results of conventional table-reporting and analysis of dimensions are reported, evaluated, and discussed. Points of emphasis are (a) debut, (b) actuality, (c) frequency of abuse, (d) distribution, (e) an entrance and escalation hypothesis of drug use, (f) matters of significance in injecting drugs, and (g) the need for narcotics. It was found that 40% of the Ss (23,305 18-yr-old conscripts) 1st began using drugs in 1967, while those Ss with more serious abuse began earlier. Most Ss started with marihuana and only a minor proportion continued. Ss who began with other drugs more often continued and changed to more serious drugs. Frequency of abuse seemed to be a prominent factor and highly related to other aspects of drug abuse. The subjective need for narcotics was found to be very low, but estimation of the need from abuse habits gave a slightly higher value.—*English summary*.

4936. Wolff, Bertil; Netz, Björn, & Lilieblad, Bertil. **Narkotikamissbruk hos Inskrivningsskyldiga 1968/69: IV. Socialpsykologiska aspekter på narkotikamissbruk.** [Drug abuse among conscripts 1968/69: IV. Drug abuse as seen from social psychology.] *MPI B-Rapport*, 1969(Aug), No. 29, 62 p.—Continues the study by B. Lilieblad and B. Wolff (see PA, Vol. 46:Issue 3) on drug abuse in the Swedish Army. The relationship between narcotic drug abuse and variables, e.g., social background, different kinds of adaptation, and attitudes and use of alcohol and tobacco, were examined. These variables were studied in relation to type of drug abuse and a construct called "propensity for drug abuse." The concept of drug abuse was found to be rather vague, since both those with and without drug abuse could be regarded as heterogeneous groups. The propensity for drug abuse construct appeared to be highly relevant for investigations of this kind. Emotional stability was a very important variable, and experience in the home environment the most relevant aspect of orientation to or rejection of drugs. Immediate measures against narcotic drug abuse appeared to be a very complex area. Prevention is discussed as necessitating an improvement of the resources of mental and social treatment services.—*English summary*.

PERSONALITY

4937. ———. Abraham H. Maslow: A bibliography. *Journal of Humanistic Psychology*, 1970(Fal), Vol. 10(2), 98-110.

4938. Back, Kurt W. & Bourque, Linda B. (Duke U.) Can feelings be enumerated? *Behavioral Science*, 1970(Nov), Vol. 15(6), 487-496.—Investigated whether deep emotional experiences can be assessed only in intensive clinical interviews, or whether they can be studied in survey interviews on representative samples as well. 3 Gallup Polls on transcendental experiences show that these experiences can be investigated in surveys. Results meet the criteria of comprehension and scalability. Positive responses about having the experiences increased over a 6-yr span. This change seems to be due partly to increased acceptability of these experiences, and partly to methodological reasons, i.e., increased confidence of the interviewers in asking the questions. (16 ref.)—*Journal abstract*.

4939. Cartwright, Desmond S. & Cartwright, Carol I. (U. Colorado) *Psychological adjustment: Behavior and the inner world*. Chicago, Ill.: Rand McNally, 1971. xi, 248 p.

4940. Erikson, Erik H. (Harvard U.) *Autobiographic notes on the identity crisis*. *Daedalus*, 1970(Fal), Vol. 99(4), 730-759.—Identity crises in the life histories of individuals are related to unconscious tensions, interpreted in broadly psychoanalytic terms. The manifestations, however, often depend upon the latent panic pervading an entire culture during a specific epoch. Erikson's own intellectual development is explicitly related to identity problems in the old world, and to the additional ambiguity incidental to the adjustment to America. The thesis that identity crises play the key role in psychopathology which in an earlier epoch was occupied by sexual suppression and conflict is restated, and the genesis of the thesis is explained by reference to autobiographic data.—R. F. Creegan.

4941. Gilbert, Albin R. (West Virginia Wesleyan Coll.) Bringing the history of personality theories up to date: German theories of personality stratification. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 725-726.—Since the 1930s, virtually unnoticed by non-German students of personality due to the communication eclipse between them and German psychologists of the Nazi period, the theory of personality strata took its rise in Germany. Briefly stated, the thesis of the theory of personality stratification is that personality is a product of genetically earlier and later functional integrations ("strata"), with the later emerging from the older and superimposing themselves upon the earlier strata.—*Author abstract*.

4942. Müller, Heinz A. *Problematik und Bedeutung des psychologischen Ich-Begriffs*. [Problems and meaning of the psychological ego concept.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1969, Vol. 17(1-2), 117-129.—Presents a historical review of the development, acceptance, and current decrease in popularity of the ego concept. While behaviorists reject this concept, those involved in social psychology and psychoanalysis continue to purport its usefulness. Other concepts which can be compared favorably with the ego concept are: "totality," Gestalt, "individuality," "spontaneity," and "aim-directedness." (32 ref.)—B. Stanton.

PERSONALITY TRAITS & PROCESSES

4943. Bezdek, William & Strodtbeck, Fred L. (U. Chicago) Sex-role identity and pragmatic action. *American Sociological Review*, 1970(Jun), Vol. 35(3), 491-502. Evaluates the proposition that "being means-oriented is structurally parallel with male sex-role requirements, while being goal-oriented is parallel with female role requirements." This proposition is confirmed, not through sex-role classifications derived from attitude scales or biological sex itself, but through sex-role classification derived from the Franck Drawing Completion Test. Originally validated by its ability to discriminate boys from girls, the test is reconceptualized as a kind of "pragmatic" vs. "idealistic" value score. The interpretation that "unconscious" (i.e., projectively measured) femininity in males interferes with task accomplishment is challenged, and a broader theory relating sex-role identity and performance is suggested. (19 ref.)—*Journal abstract*.

4944. Bierkens, P. B. & Frantzen, L. L. (Roman Catholic U., Inst. of Medical Psychology, Nijmegen, Netherlands) *Nader onderzoek met de Barron Ego Strength scale*. [Further research on Barron's Ego Strength scale.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Dec), Vol. 25(11), 677-689.—The Netherlands version of Barron's Ego Strength scale was administered to 25 normal Ss, 20 outpatient psychiatric Ss, 25 clinical psychiatric Ss, and 25 outpatients with back pains. Ss responded to 66 items of the scale. Significant differences at the .001 level were found between the normals and outpatients with back pains and the other 2 groups. No significant differences were found between the normals and outpatients with back pains. The results of cluster analysis indicate that the composition of the scale is rather heterogeneous. 28 items, such as "Sometimes an undesirable thought dwells in my head for days on end," constituted the cluster that was most homogeneous and had the highest r of .72 with the total score. This cluster related to worries about physical and mental well-being. According to these findings, Barron's concept of ego strength could be specified as the absence of complaining behavior. (English summary)—A. J. Ter Keurst.

4945. Chiriboga, David & Lowenthal, Marjorie F. *Psychological correlates of perceived well-being*. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 603-604.—Investigated the comparative impact of psychological resources and deficits on self-perceived well-being or happiness in community-based respondents ranging in age from 16-61. The separate measures of resources and deficits represent independent dimensions, and both are relevant to the subjective sense of well-being. The interaction of resources and deficits was relatively complex: those with many resources and many deficits tended to be happiest, those with few resources and many deficits were least happy. It is concluded that resources may compensate for so-called "deficits," and that the interaction of the 2 dimensions may actually enhance a sense of psychological well-being. *Author abstract*.

4946. Di Giuseppe, Raymond A. (Villanova U.) *Correlation of locus of control with four EPPS items*. *Psychological Reports*, 1971(Feb), Vol. 28(1), 290. Examined correlations between EPPS scores of dominance, achievement, endurance, and autonomy and on Rotter's

Internal-External Control Scale for 30 male undergraduates. Dominance was significantly ($p < .01$) related to internal control. No other correlations reached significance. It is suggested that Ss who score internally on the Rotter test, may not test high on the 4 EPPS scales, while high scoring Ss on the EPPS scales may still score internally on Rotter's test.—S. Knapp.

4947. Feather, N. T. & Simon, J. G. (Flinders U., South Australia) **Attribution of responsibility and valence of outcome in relation to initial confidence and success and failure of self and other.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 173-188.—Tested 128 undergraduates in like-sex pairs with 5 practice and 15 test anagrams varied in difficulty so that $\frac{1}{2}$ the Ss would do well and $\frac{1}{2}$ poorly. Pretest confidence ratings and posttest attributions of performance to ability or luck, recall measures, and satisfaction ratings for self and other were analyzed. Results indicate that (a) Ss were more confident of other's success than their own, (b) the unexpected outcome was more often attributed to luck, (c) other's success was more often attributed to ability and failure to bad luck than self's own success or failure, (d) a positivity bias in recall favored the other, (e) contrast effects occurred for satisfaction ratings, and (f) task performance was a dominant factor influencing confidence and satisfaction ratings. Results are discussed in terms of models involving F. Heider's principle of balance and his analysis of the causes of action, in terms of positivity biases in social perception, and as indicating effects of the social context of performance upon attribution and valence. (20 ref.)—*Journal abstract*.

4948. Foulds, Melvin L. & Warehime, Robert G. (Bowling Green State U., Counseling Center) **Effects of a "fake good" response set on a measure of self-actualization.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 279-280.—Administered the Personal Orientation Inventory (POI) twice to 95 undergraduates, 1st under ordinary testing conditions and then under a "fake good" condition. Deliberate attempts to dissemble in a positive direction resulted in depressed scores on 10 of 12 scales and mean score differences were significant ($p < .05$) on 9 of these scales. The mean score on 1 scale was significantly ($p < .01$) higher on the 2nd administration of the inventory. Findings suggest that POI scores are unlikely to be inflated by the conscious or unconscious attempts of Ss to make a good impression on the inventory when they have little knowledge of the self-actualizing model of man.—*Journal abstract*.

4949. Fozard, James L. & Nuttall, Ronald L. (Veterans Administration Outpatient Clinic, Boston, Mass.) **Effects of the age and socioeconomic status differences on the Sixteen Personality Factor Questionnaire scores.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 597-598.—The 16 PF Questionnaire was administered to 1146 28-83 yr. old males, and across 4 levels of socioeconomic status (SES). The data supported the hypothesis that the effects of age and SES differences are statistically independent. The effects of the age grouping on scale scores equally distributed over 6 levels, but those for SES were divided between 2 levels. Some scale scores were influenced only by differences in age or SES, but 3 were influenced by differences in both. Generally, SES summarized differences in occupations well. The

observed effects of age differences generally agreed with earlier results. —*Author abstract*.

4950. Gáspárné-Zauner, Éva. (Inst. of Highest Formative Teaching, Budapest, Hungary) **Vizsgálatok a pszichológiai érték körében.** [Studies in the field of psychological values.] *Pszichológiai Tanulmányok*, 1968, No. 11, 217-239.—The concept of motivation has been found to be used in psychological literature in a very broad sense. It is therefore necessary that the idea of motivation be stripped of the psychological concepts of purpose and value. However, the psychological value concept should be distinguished from its philosophical counterpart. When classifying psychological values, their function in the psyche should be examined. On this basis psychological values have been classified as factual and regulative, after H. Margenau. The expansion of the personality is directed at factual values, while regulative values determine the way of action. The 2 classes of values affect the psyche in contrary directions. The value system of an adolescent girl is studied, and the role of the 2 types of values in the development of her personality indicated. The function of factual and regulative values is shown in an examination of 8-yr-old children. An even distribution in the functions of the 2 types of values has been found to be the most favorable. Overdominance of factual values produces greed, and that of regulative values overinhibition. It is suggested that educational psychology should develop adequate methods for the assessment of value systems. (Russian summary) (39 ref.)—*English summary*.

4951. Gergen, Kenneth J. (Swarthmore Coll.) **The concept of self.** New York, N.Y.: Holt, Rinehart & Winston, 1971. x, 106 p.

4952. Hall, Jay & Williams, Martha S. (Teleometrics, Inc., Houston, Tex.) **Personality and group encounter style: A multivariate analysis of traits and preferences.** *Journal of Personality & Psychology*, 1971(May), Vol. 18(2), 163-172.—Cites the needs for interpretive parsimony and contextual relevance in the case of assessment devices employed in studies of individual characteristics and group performance. The development of a conceptual model and a related instrument serving those needs is discussed. A multivariate analysis of the relationship between the domains of personality and style preference scores from the Group Encounter Survey was made. Data from 43 male and 40 female undergraduates on some 28 dimensions of personality were assessed relative to group styles. Results from a canonical analysis reveal a strong underlying system of correlation for both male and female samples. It is suggested that the Group Encounter Survey may be more predictive to group performance than traditional multiple inventory approaches. (31 ref.)—*Journal abstract*.

4953. Heaps, Richard A. (Brigham Young U.) **Physical vs. social comparison standards: Their effect on bodily interpretations.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 323-324.—Tested the relative influence of social and physical standards of comparison had on self-interpretations of a particular bodily state. The results gave support to Schachter's cognitive-physiological theory of emotion. Ss' estimates of their physical fitness levels were influenced by manipulating the social and physical standards for self-comparison available to them. The social and physical information were inde-

pendently effective, although the physical information appeared to have a greater impact on the Ss' fitness self-estimates.—*Author abstract.*

4954. Karabenick, Stuart A. (Eastern Michigan U.) **On the relation between personality and birth order.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 258.—Examined 62 1st-, 61 2nd-, and 47 later-born undergraduates on 3 personality dimensions: (a) need for achievement, (b) test anxiety, and (c) need for social approval. Although later born Ss tended to score higher on all measures, no significant differences were found. It is suggested that some restrictions of the generality of previous findings may be indicated. Sampling differences are noted.—*S. Knapp.*

4955. Kurtz, Richard M. (Washington U.) **Body attitude and self-esteem.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 467-468.—Investigated the relationship between a person's global body attitude as measured by the multidimensional Body Attitude Scale and sense of self-esteem as assessed by the Ziller Self-Esteem Scale. Ss were 20 male and 20 female college students. The study also attempted to replicate earlier findings of sex differences in body attitudes. The prediction that high self-esteem is related to a positive body attitude was confirmed as well as the previous finding that females like their bodies better than males. The predicted interaction between sex and self-esteem on the Potency body attitude dimension was also confirmed.—*Author abstract.*

4956. Langley, C. W. (Harvard U.) **Differentiation and integration of systems of personal constructs.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 10-25.—Examined aspects of the generality and interaction of differentiation and integration. Ss were 246 students. Hypotheses were tested by analysis of variance for Ss at extremes on Repertory Test "system" measures of differentiation and integration. Effects at or near significance were observed for differentiation in analytic performance (Concealed Figures Test), and for integration in intuitive performance (Test of Intuitive Leaps). (32 ref.)—*Journal summary.*

4957. Lindenaue, Geoffrey G. **Escape.** *Journal of Emotional Education*, 1970(Spring), Vol. 10(2), 29-32.—Man wants to escape from looking at the painful, unfulfilled parts of himself and flee into the world of fantasy. But in trying to escape from himself he becomes blind to his own real potential. It is only by entering the world of others that it is possible for him to discover himself and live in the adult world of "we" rather than the child's world of "I."—*Journal abstract.*

(Royal Military Academy of Belgium, Brussels) **La structure fondamentale de nos comportements: Le sens authentique de la libido.** [The basic structures of our behaviors: The authentic sense of the libido.] *Information Psychologique*, 1970(Jan), Vol. 10(37-38), 5-45.—Discusses self-preservation and self-affirmation as a basic human drive. References from clinical and industrial psychology are used to illustrate the point.—*S. G. Vandenberg.*

4960. Morgan, William P. (U. Missouri, Human Performance Lab.) **Pre-match anxiety in a group of college wrestlers.** *International Journal of Sport Psychology*, 1970, Vol. 1(1), 7-13.—Compared the preseason

(base-line) and prematch anxiety levels of college wrestlers. Form A of the Institute for Personality and Ability Testing (IPAT) 8-Parallel-Form Anxiety Battery was administered in preseason to 27 candidates, and 7 of the original Ss continued throughout the study. Form B of the IPAT Battery was administered to the wrestlers prior to an easy match, and Form C was administered before a difficult match. Form C was also administered to the 9 members of the opposing team prior to the difficult match. Anxiety levels were significantly lower in the prematch settings but did not differ significantly prior to either the easy or difficult match. The anxiety levels of both teams did not differ significantly for the prematch. (French summary) (16 ref.)—*Journal summary.*

4961. Smith, Barry D. & Teevan, Richard C. (U. Maryland) **Relationships among self-ideal congruence, adjustment, and fear-of-failure motivation.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 44-56.—Fear-of-failure motivation was seen as related to reduced self-satisfaction, adjustment level, and achievement related self-acceptance. 49 male and 50 female college Ss performed on the Hostile Pretest measure of fear-of-failure, a Q-sort, and the Self-Rating Inventory (SRI). In correlational analyses, fear-of-failure was inversely related to both self-ideal congruence ($p < .025$ for each sex) and adjustment ($p < .10$ for males, $p < .005$ for females). SRI data were partially supportive of these conclusions. Achievement congruence was inversely related to fear-of-failure for males ($p < .005$). It is concluded that fear-of-failure motivation in males, while achievement-related, is also associated with a generalized reduction in self-acceptance. (150 ref.)—*Journal summary.*

4962. Stock, William A. & Looft, William R. (Iowa State U.) **Relationships among several demographic variables and the change seeker index.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 1011-1014.—Administered the Change Seeker Index (CSI), an instrument for measuring "preference for stimulus complexity," to 277 undergraduates. Correlations were computed for the CSI with college curriculum, parents' occupation, birth order, and other demographic variables. Most correlations, with the exception of perceived political ideology, were 0 order. 3 other correlations reached statistical significance but were of questionable theoretical or practical significance. The finding of non-relationship of the CSI with birth order is discussed in light of recent reports of significant relationships of birth order with other measures of stimulus-complexity preference.—*Journal abstract.*

4963. Thayer, Robert E. (California State Coll., Long Beach) **Personality and discrepancies between verbal reports and physiological measures of private emotional experiences.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 57-69.—Reports 2 studies in which 1 of the dependent variables was discrepancy scores between concurrent measures of controlled verbal reports of transitory activation and physiological composites. The discrepancy scores of 23 Ss correlated with authoritarianism, antiuntraception, number of brothers and sisters, extroversion, and the ratings by others of the Ss' self-insight. A partial-replication study involved 26 Ss and a slightly different method of obtaining "in-setting" verbal reports. Through verbal reports were probably not as reliable in the 2nd study, discrepancies were again found to be correlated with authoritarianism and

number of brothers and sisters. (18 ref.)—*Journal summary*.

4964. Throop, Warren F. & MacDonald, A. P. (Carnegie-Mellon U.) **Internal-external locus of control: A bibliography.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 175-190.

4965. Weisskopf-Joelson, Edith. (U. Georgia) **Some comments on the psychology of the psychologist.** *Journal of Psychology*, 1971(May), Vol. 78(1), 95-113. Proposes that the diversity of psychological approaches and the emotional commitment and animosity between representatives of the various approaches constitutes a psychological problem. 2 types of psychologists are broadly distinguished and described: the speculative and the empirical psychologist. The thinking processes and procedures of the 2 types are analyzed and discussed in terms of Maslow's concepts of deficiency motivation and means centering as defenses against anxiety. The empirical psychologist is seen as using the mechanisms of isolation, while the speculative psychologist uses projection and intellectualization. It is further suggested that, since most psychologists are men and the helping professions are generally considered feminine, the empirical psychologists may be using the mechanism of denial to defend themselves. However, the speculative psychologists seem to have given up the masculine role in their avoidance of all dissecting, analytic thought. It is concluded that "If psychologists were to become conscious of the defensive nature of their approaches, they might cease to be means centered and instead, adapt their method to the objective requirements of the search for knowledge." (32 ref.)—*S. Knapp*.

4966. Zimring, Fred M. (U. Chicago) **Cognitive simplicity-complexity: Evidence for disparate processes.** *Journal of Personality*, 1971(Mar), Vol. 39(1), 1-9.—Word-association latencies, measures derived from a variant of Kelly's Repertory Test (number of similarly used words in a factor and the number of checks), and the frequency of usage in the language of the constructs were employed. Within the cognitively simple group the S who checks more words as similar to his constructs has slower word-association latency, has fewer constructs in his 1st factor (and so presumably has more factors or dimensions), and uses words of less frequent usage in the language than the cognitively simple member who finds fewer words similar. Thus, it appears likely that the more differentiating member of the cognitively simple group uses dimensions of similarity rather than simply not using dimensions of difference.—*Journal summary*.

Behavior Correlates

4967. Axtell, Bryan & Cole, Charles W. (American Inst. for Research, Lagos, Nigeria) **Repression-sensitization response mode and verbal avoidance.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 133-137.—Requested 96 undergraduates, classified as repressors, sensitizers, and neutrals, to discuss themselves either positively or negatively. $\frac{1}{2}$ the Ss were exposed to prerecorded verbal feedback during their discussion. A $3 \times 2 \times 2 \times 2$ analysis of variance indicates that repressors talked less and did not respond to the simulated verbal interaction with greater durations of verbalization. Under feedback conditions, females verbalized more regarding their positive qualities than their negative ones, while males verbalized more on

negative than positive. Results are consistent with those of previous investigations, and support for an interpretation of repression as learned avoidance.—*Journal abstract*.

4968. Bruchon, Marilou. (Faculty of Letters & Humane Sciences, Nanterre, France) **L'amplitude gestuelle et la personnalité.** [Gestural amplitude and personality.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6 8), 426-427. The angle formed by the raised arms, the length of a step, amplitude of free leg movement, the area covered in writing, and the area covered by a drawing of a person were assessed for 20 Ss in an effort to support the hypotheses that (a) "gestural" amplitude is an organization of habitual motor responses, (b) there is a correlation between gestural extroversion and social extroversion (Guilford's Trait S), (c) there is a positive correlation between gestural extroversion and psychological extroversion (Guilford's Trait T), (d) gestural amplitude is not the same for boys and girls, and (e) gestural amplitude could be compared to general activity (Guilford's Trait G). Arm angle, step length, and free leg movement showed a substantial intercorrelation (.67) as did the writing and drawing size ($r = .44$). Only writing and drawing size showed a positive correlation with social extroversion ($r = .33$ and $.22$), while all of the measures correlated positively with psychic extroversion. There was no significant difference in the performance of males and females.—*R. E. Smith*.

4969. Di Giuseppe, Raymond A. (Villanova U.) **Dogmatism correlation with strength of religious conviction.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 64.—Selected 50 undergraduates at random and administered the Dogmatism Scale and an attitude questionnaire measuring the strength of religious convictions. A Spearman rho was .89 ($p < .01$). Strength of religious conviction was positively correlated to Dogmatism Scale scores.—*Author abstract*.

4970. Greaves, George. (Georgia State U.) **Level of conceptual system functioning in experience with sex and drugs.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 130. Theoretical work in conceptual systems theory describes System 1-functioning persons as rigid, rule-obeying, authority- and culture-oriented, and System 4 persons as flexible, relativistic, and culturally independent. 10 System 4 Ss and 74 System 1 Ss responded anonymously to a series of questions related to sex and drug experiences. System 4 Ss reported significantly more experience with marihuana, LSD, premarital petting, premarital intercourse, and disposition to extramarital intercourse than their System 1 counterparts. Findings are consistent with the theoretically atypical cultural style of these Ss described by earlier researchers in conceptual systems theory.—*Author abstract*.

4971. Hearn, Curry B. & Seeman, Julius. (Upjohn Co., Nashville, Tenn.) **Personality integration and perception of interpersonal relationships.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 138-143.—Studied the ways in which individuals at different levels of personality integration perceive interpersonal relationships. 2 groups of 26 male undergraduates each were selected for high or middle scores on the Personality Integration Reputation Test. A picture-story test was administered and scored. 5 hypotheses concerning predicted differences in perception were substantially confirmed. The high group (a) perceived more relationships, (b) used more affect terms,

(c) used more approach and sharing terms, (d) reported more positive affect, and (e) used more diversified affect and behavior terms. (27 ref.)—*Journal abstract.*

4972. Holmes, David S. (Educational Testing Service, Princeton, N.J.) **Compensation for ego threat: Two experiments.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 234-237.—Conducted 2 experiments with 24 and 18 undergraduate males to provide (a) experimental demonstrations of the use of compensatory behavior in response to psychological threat, and (b) a paradigm through which the process and effects of compensation could be studied. Ss were ego threatened by being led to believe that they were going to have to suck on a baby's rattle, bottle, pacifier, and a breast shield while their level of enjoyment was recorded. Subsequently, Ss elected to receive higher levels of electrical shock or to squeeze a hand dynamometer more times than did control Ss who were not led to believe that they were going to suck on the baby-associated objects.—*Journal abstract.*

4973. Jennings, Floyd L. (U. Texas, Southwestern Medical School, Dallas) **Religious beliefs and self-disclosure.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 193-194.—Investigated the relationship between religious beliefs and scores on S. Jourard's self-disclosure scale for 83 undergraduates. The correlation between beliefs and self-disclosure was 0-order. Ss did perceive themselves to be significantly more "liberal" in religious beliefs than they felt their parents would expect.—*Journal abstract.*

4974. Lewis, Philip & Blanchard, Edward B. (U. Georgia) **Perception of choice and locus of control.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 67-70.—Selected 220 undergraduates on the basis of high and low scores on Rotter's Internal vs. External Locus of Control (I-E) Scale. Ss were given 3 levels of choice to take the role of either the electric shock-giver or receiver in a learning experiment. The perceived freedom of choice in those conditions in which choice was restricted turned out to be a complex function of locus of control, choice condition, and task role. A tentative explanation is offered in terms of both dissonance and reactance theories.—*Journal abstract.*

4975. Pflaumer, Elizabeth M. (Ohio State U.) **Personality correlates of effective listening.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3686.

4976. Staub, Ervin; Tursky, Bernard, & Schwartz, Gary E. (Harvard U.) **Self-control and predictability: Their effects on reactions to aversive stimulation.** *Journal of Personality & Social Psychology*, 1971(May), Vol. 18(2), 157-162.—Investigated the effect of control predictability on reactions to aversive stimulation. 40 paid Ss received a sequence of electric shocks, gradually increasing in intensity under conditions of self- and no-control. Subjective judgment points, including decision about limit of endurance, and heart rate were used to assess reactions. It was found that a small variation in control and predictability (who pushed the shock button) did not itself affect reactions. However, compared to self-control Ss, no-control Ss judged less intense shock as uncomfortable and tolerated somewhat less shocks. These differences disappeared on a 2nd administration of shocks when both groups were given no-control conditions. The experimental treatments also affected heart rate reactions to the shocks. Findings suggest that control predictability can reduce the aversiveness of noxious stimulation. (20 ref.)—*Journal abstract.*

4977. Tennyson, Robert D. & Woolley, F. Ross. (Florida State U.) **Interaction of anxiety with performance on two levels of task difficulty.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 377-378.—A concept acquisition program was divided into difficult and easy sections based on empirically determined probability ratings of the positive and negative instances. Measured anxiety levels and task difficulty were predicted to produce a disordinal interaction. Anxiety was measured by the State-Trait Anxiety Inventory and blood pressure. Anxiety scores increased for the 29 college students during the difficult task and decreased with the easy task ($p < .01$). A disordinal interaction resulted between the 2 tasks when the relative mean error performance of the high and the low anxiety-state Ss was reversed ($p < .05$).—*Author abstract.*

4978. Ward, William D., Day, Charles R., & Hamlin, Richard L. (State University Coll. New York, Brockport) **Perceived similarity to parents as related to responsibility to social reinforcement.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 951-957.—Tested the hypothesis that perceived similarity to parents is a function of one's responsibility to social reinforcement. 31 male undergraduates were given the Role Construct Repertory Test and a verbal conditioning procedure. Results demonstrate a negative relationship. Although there were no differences in conditionability between Ss low and high in perceived similarity to father or between Ss low and high in perceived similarity to mother, when the scores for perceived similarity to the mother and the father were combined, the negative relationship was clear-cut ($p < .01$). The theoretical implications are discussed.—*Journal abstract.*

INTELLIGENCE

4979. Adcock, C. J. & Webberley, M. (Victoria U., Wellington, New Zealand) **Primary Mental Abilities.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 229-243.—Contends that the Guilford structure of intellect schema is too cumbersome for practical use and provides a logical basis for the classification of test material rather than a parsimonious schema of major cognitive factors. In 3 factor-analytic studies, a simplified model involving 3 content areas and 8 basic operations was investigated. Findings indicate that the symbolic content area is superfluous, symbols functioning as figural or semantic according to their use. The result is a 2×8 schema in which no material for the cells is allotted to semantic speed of closure, which is thought to really be the verbal insight factor, or semantic flexibility of closure, which is explained by a possible failure to include suitable tests. Considerable doubt about a separate semantic perceptual speed factor is noted.—*Author abstract.*

4980. Bickley, A. C., Dinnan, James A., & Bickley, Rachel. (Morehead State U.) **Language responses as a predictor of performance on intelligence tests.** *Journal of Reading Behavior*, 1970(Fal), Vol. 2(4), 291-294.—130 19 and 20 yr. old Ss were administered the Otis Quick-Scoring Mental Ability Tests along with 30 words from Coleman's word list to determine the relationship between verbal responses and intelligence test scores. Ss were chosen from a college and a prison training institution. The results of the language responses

were classified according to paradigmatic (e.g., same word class such as duck-bird) and syntagmatic (e.g., sequence or logical association such as duck-shoot) responses. The findings indicate that individuals who perform linguistically according to a paradigmatic approach are likely to score higher on the Otis. In this sense the Otis imposes language constraints. Caution is placed on the applicability of a test that imposes verbal constraints upon the examinee.—*W. L. Chovan.*

4981. **Gardner, Riley W. & Lohrenz, Leander J.** (Menninger Foundation, Topeka, Kan.) **Some old and new group tests for the study of cognitive controls and intellectual abilities.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 935-950.—Presents validity and reliability findings for new group forms of Thurstone's Color-Word Test and Voth's Autokinetic Test. Split-half, alternate, or shortened forms were constructed of several other old and new cognitive control tests and some key intellectual ability tests to explore the reliability of these procedures and the possibility of using shortened forms. Ss were groups of 28, 25, and 46 undergraduate and graduate students. Results suggest that important savings in testing time may be achieved in exploratory studies by using the procedures described here. (21 ref.)—*Journal abstract.*

4982. **Heller, M., et al.** (U. Fribourg, Switzerland) **Quotient intellectuel et rang centile.** [Intelligence quotient and percentile rank.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(2), 71-79.—An abac and 2 original nomographs facilitate conversion of IQs and percentile ranks, based on any IQ mean and with a standard deviation ranging from 4-20, without arithmetical operations. (16 ref.)—*K. J. Hartman.*

4983. **Ostijn, N.** (Center of Studies & Organization, Section of Psychology, Brussels, Belgium) **Niveau d'instruction et test non verbal: Etalonnage du test de Gédéon sur des jeunes gens de 19 à 22 ans.** [Educational level and the nonverbal test: Standardization of the Gédéon Test on young persons 19 to 22 years old.] *Bulletin de Psychologie Scolaire et d'Orientalion*, 1970(Sep), Vol. 19(3), 123-129.—To determine whether or not educational level plays an important role in the results of a test whose content is completely unrelated to subject matter taught, the Gédéon Space Relations Intelligence Test, B Form, was administered to 3122 19-22 yr. old Belgian soldiers. Results differed by educational level (approximately 1% for raw scores, statistically calculated as significant) for those having finished primary school only, primary school and 1 or 2 yr. of secondary school, lower technical school, and lower middle school. It is concluded that educational level must be taken into account even for nonverbal tests. (English summary)—*T. N. Webster.*

4984. **Simmons, William L.** (American Psychological Assn., Washington, D.C.) **Human intelligence: The psychological view.** *Science Teacher*, 1968(Sep), Vol. 35(6), 18-20.—Reviews 2 schools of thought on the nature of human intelligence emphasizing the historical backgrounds and unique aspects of each. 1 view holds that intelligence is an entity, having an actual existence and residing in the brain of an individual. The other view holds that intelligence is a construct created to account for "a multitude of behavioral events." Despite differences between the 2 schools, they both support efforts to enhance intellectual functioning by encouraging innovative approaches to teaching and exposure to

stimulating environments that will arouse interest and increase success in intellectual activities.—*P. McMillan*

4985. **Thyssen, Sven.** (Danish Inst. for Educational Research, Copenhagen, Denmark) **Intelligens og intelligensprøver.** [Intelligence and intelligence tests.] *Nordisk Psykologi*, 1969, Vol. 21(5), 347-357.—Presents a definition of intelligence functions, and discusses its consequences. The relations between intelligence phenomena and need theory, and the construction of a model for intelligence functions that is analogous with E. Tranekjær Rasmussens completeable need theory are important. Need has to do with goals for behavior; intelligence functions are then defined by all those aspects of behavior which have to do with ways to goals, which are not only problem-solving behavior, but also behavior of smooth and/or automatic character. Apparently, aspects of intelligence function may change in 2 ways: (a) by learning (education), and (b) by changes in the need structure. A proposal for classification of intelligence phenomena, in order to point out aspects of intelligence functions, is advanced: (a) what needs are functioning; (b) in what world of phenomena does the individual act; and (c) what relations do exist, or come into existence, between the phenomena the individual is dealing with. The implications for test construction are discussed. Of particular importance is the proposal that different instructions should be used in intelligence tests, in order to create different need situations.—*English summary.*

CREATIVITY

4986. **Carlier, Michèle.** (U. Paris, France) **Une modalité de la créativité: La flexibilité, ses relations avec l'intelligence et les aptitudes primaires.** [A modality of creativity: Flexibility, and its relation to intelligence and primary aptitudes.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(3), 151-164.—Presents a matrix of intercorrelations among 5 tests of intelligence and 11 tests of creativity. Variables of flexibility in relation to creativity are concluded to be independent of general intelligence and primary aptitudes. The independence of flexibility is shown to be constant at all levels of an obtained curve of intelligence. (19 ref.)—*K. J. Hartman*

4987. **Eisenman, Russell.** (Temple U.) **Components of creativity, verbal conditioning, and risk taking.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 687-700.—Reports 3 studies to elucidate the nature of creativity, as defined by scores on a personality questionnaire, the Personal Opinion Survey. In Study I with 231 adult males and females, a cluster analysis suggested 2 important components for highly creative Ss: a bipolar cluster of personal vs. impersonal competence, and an adventurousness cluster. In Study II with 160 undergraduates from a total sample of 295, it was predicted and found that Ss who were personally competent would respond more on a verbal conditioning task if E preceded the conditioning with a friendly (socially enhanced) interaction, while impersonally treated but competent Ss conditioned better in a skill than in a chance condition. In Study III with 62 undergraduates, adventurous Ss took more risks in 2 different classroom investigations. Additional findings are presented which suggest errors in previous conceptualizations of creativity. (25 ref.)—*Journal abstract.*

4988. **Garfield, S. Jeffrey; Cohen, Helen A., & Roth,**

Robert M. (Educational Resources, Inc., Chicago, Ill.) **Creativity and mental health.** *Journal of Educational Research*, 1969(Dec), Vol. 63(4), 147-149.—47 male 18-24 yr. old undergraduates were given tape-recorded clinical interviews and a battery of creativity tests, including the Barron Welsh Art Scale. 3 experienced clinical psychologists rated each S's interview on a 4-point mental health scale. Other judges rated the interviews on C. R. Rogers' elements of creativity, i.e., (a) openness to experience, (b) internal locus of evaluation, and (c) spontaneity. Results are interpreted as empirically supporting the theoretical position that there is a positive correlation between mental health and creativity. Specifically it lends validity to Rogers' postulations concerning the elements which comprise creativity.—*Journal abstract.*

4989. Gorman, Bernard S. & Breskin, Stephen. (Queens Coll., City U. New York) **Non-verbal rigidity, creativity, and problem solving.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 715-718.—Rigidity vs. flexibility has often been mentioned in discussions of creativity and problem solving. The relation of a nonverbal test of rigidity (Breskin Rigidity Test) to tests of semantic redefinition, associational fluency, inductive reasoning, and drawing completion was investigated using 38 male and 33 female undergraduates. The performance of flexible Ss was significantly better than the performance of rigid Ss on all tests but an associational fluency test—Fa-3 Associations IV Test.—*Journal abstract.*

4990. Krippner, Stanley & Hughes, William. (Maimonides Medical Center, William C. Menninger Dream Lab., New York, N.Y.) **Genius at work.** *Psychology Today*, 1970(Jun), Vol. 4(1), 40-43.—"Recent studies indicate that dreaming and creative processes are related." Dream material can be creative because normal bounds of language or social desirability are removed. A number of dreams which helped in scientific breakthroughs and artistic inspiration are presented.—E. J. Posavac.

4991. Pléh, Csaba. (Eötvös Lóránd U., Budapest, Hungary) **A szorongás, a siker és a kudarc hatása a kreatív gondolkodás néhány faktorára.** [Effect of anxiety, success and failure on some factors of creative thinking.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 242-255.—A negative correlation was found between manifest anxiety and scores on the divergent factors of creativity in Guilford's Unusual Uses test. In a less difficult creativity task success raised level of performance, especially for highly anxious Ss. Following failure, low anxious Ss improved their performance, while high anxious Ss did worse. (English & Russian summaries) (20 ref.)—M. Moore.

4992. Rothenberg, Albert. (Yale U., Medical School) **The process of Janusian thinking in creativity.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 195-205.—Discusses "Janusian thinking"—the capacity to conceive and utilize 2 or more opposite or contradictory ideas, concepts, or images simultaneously—in relation to its role in the creative process in art, literature, architecture, music, science, and mathematics. It is suggested that understanding the psychological factors in creativity should be of importance in the theory and everyday practice of the art of psychotherapy. (Clinical and experimental evidence on Janusian thinking are presented. (37 ref.)—*Journal abstract.*

PERSONALITY MEASUREMENT

4993. Buros, Oscar K. (Ed.) **Personality: Tests and reviews.** Highland Park, N.J. Gryphon Press 1970 xxxi, 1659 p.

4994. Cimino, Enrico. **Primo contributo alla taratura italiana del test IKONIA-A.** [First contribution to the Italian edition of Version A of the IKONIA Test.] *Bollettino di Psicologia Applicata*, 1968, No. 88 90, 73-75.—Reports the efficiency of the A version of the IKONIA Test. This is a nonverbal test which consists of tables which represent objects and situations familiar to the S. It is designed for 6-8 yr. olds. A previous study was made on Version B, designed for 9-12 yr. olds. The Italian edition of Version A, although given to fewer Ss, confirms the results of the original version.—A. M. Faraglia.

4995. Jackson, Douglas N. (U. Western Ontario, London, Canada) **The dynamics of structured personality tests: 1971.** *Psychological Review*, 1971(May), Vol. 78(3), 229-248.—Reviews issues raised by the classic manifesto by P. Meehl (see PA, Vol. 20:482) in 1945 on the dynamics of structured personality inventories in the light of subsequent developments. A series of principles relating to personality scale development is proposed, which highlights the role of psychological theory and item content in formulating a multifaceted item pool, and the importance of suppressing response biases. Because of the competing and often interacting relation of trait and method variance, multivariate procedures for scale construction and evaluation of discriminant validity are considered essential. It is concluded that considerably more is now known about personality and scale construction, and that personality assessment specialists need not abandon their unique human capacity to judge and evaluate item content. (55 ref.)—*Journal abstract.*

4996. Ogston, Don & Drakelord, Grant C. (U. Calgary, Alberta, Canada) **Note on the Costello-Comrey Anxiety Scale (CCAS).** *Psychological Reports*, 1971(Feb), Vol. 28(1), 287-289.—Reports a study of the reliability, validity, and discriminability of the Costello-Comrey Anxiety Scale (CCAS). The scale compared very favorably with other accepted measures of anxiety. It is concluded that the economical length and 4-point response mode suit it for use in both applied and research settings.—*Journal abstract.*

4997. Pareek, Udai; Rao, T. Venkateswara; Ramalingaswami, Prabha, & Sharma, B. R. (National Inst. of Health Administration & Education, New Delhi, India) **Developing a battery of pre-adolescent personality tests.** *Indian Educational Review*, 1970(Jul), Vol. 5(2), 1-20.—Reports the development of tests in Hindi and English designed to measure adjustment, dependency, trust, initiative and activity level among preadolescents. Thurstone's method of equal-appearing intervals was followed in the construction of the adjustment and dependency inventories. The tests to measure trust and initiative are semiprojective and the test for measuring activity level is based on a rating technique. Test-retest reliabilities and interscorer reliabilities are reported. (23 ref.)—A. C. Panda.

4998. Webb, P. A. (Management Selection, Australia Pty. Ltd., Melbourne, Victoria) **The Guilford-Zimmerman Temperament Survey: Australia business executives.** *Australian Psychologist*, 1970(Nov), Vol.

543). 278-279.—Reports norms based on a sample of 64 25-55 yr. old male Australian business executives for the Guilford-Zimmerman Temperament Survey. All Ss had IQs of 110 plus as measured by the Australian Council for Educational Research Advanced Test B40. The Australian business executive was reported as somewhat different, but not statistically, from United States norms. It is suggested that Australian norms could be relevant for similar samples in selection and placement.—*H. Roemmich.*

Inventories

4999. Bottenberg, E. H. (U. Würzburg, Inst. of Psychology, W. Germany) **Soziale Erwünschtheit im MMPI Saarbrücken.** [Social desirability in the MMPI Saarbrücken.] *Psychologie und Praxis*, 1970(Oct), Vol. 14(4), 172-179. Reliability of the Social Desirability scale is high ($r = .904$) when the German version of the MMPI is compared with the original American version. Tentative norms for the Social Desirability scale are presented for a 1st orientation. The influence of the scale concentrates on a primary factor of the MMPI, a dimension characterized by anxiety, psychic disturbance, and psychological maladjustment.—*R. F. Wagner.*

5000. Dunn, Thomas G., Lushene, Robert E., & O'Neil, Harold F. **The complete automation of the Minnesota Multiphasic Personality Inventory and a study of its response latency.** *CAI Center Technical Memorandum, Florida State U.*, 1971(Jan), No. 28, 22 p. Tested the feasibility of completely automating the MMPI and compared item response latencies with other MMPI item characteristics. 26 scales were successfully stored automatically for 165 undergraduates. The program also typed a Mayo Clinic interpretive report on a terminal, seconds after the S had completed the MMPI. For the entire MMPI item pool, separate stepwise regression analyses for males and females indicated that the number of characters in an item accounted for 47-58% of the latency variance. The variables of item ambiguity, social desirability, and social desirability-dispersion, accounted for only 3-8% of the variance. When considering the 38 MMPI critical items, "deviant" response latencies were found to be longer than "non-deviant" response latencies. It is concluded that except for subsets of personality items like the critical items, latency may not have the psychological or clinical significance often attributed to that variable. (24 ref.)—*Journal abstract.*

5001. Firetto, Anthony C. & Davey, Heather. (U. Waterloo, St. Jerome's Coll., Ontario, Canada) **Subjectively reported anxiety as a discriminator of digit span performance.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 98.—Assessed performance on the Digit Span test of the WAIS under control and ego-threat conditions. 20 male and 20 female undergraduates were asked at the completion of the test to report their reactions. The experimental conditions did not significantly affect performance. However, Ss who reported feeling no anxiety performed significantly better than Ss who reported feeling anxious.—*Author abstract.*

5002. Gough, Harrison G. (U. California, Berkeley) **Lo sviluppo di una taratura italiana l'Adjective Check List.** [The development of an Italian edition of the Adjective Check List.] *Bollettino di Psicologia Applicata*, 1968, No. 88-90, 23-31.—Outlines the research for the Italian version of the Adjective Check List (ACL). The ACL is an instrument of psychological value

composed of 300 adjectives; one can choose those words which describe himself, others, or abstract ideas. It was introduced in Italy in 1967. Studies were conducted to show that the method can be applied to economic and political questions, as well as for scholastic use. Tests from 1437 male Ss, and 893 female Ss from different areas of the country and ranging from 8-75 yr. old were reviewed and points were given to the 24 variables to obtain raw scores. A new set of norms was devised for the Italian edition of the ACL.—*A. M. Faraglia.*

5003. Kohout, Frank J. (Case Western Reserve U.) **The organization of self conceptions: Construct validity of the Twenty Statements Test.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3639.

5004. Lavit, Ronald J. (Children's Medical Center, Tulsa, Okla.) **A validation study of the Test Anxiety Questionnaire with college students.** *Psychology*, 1971(Feb), Vol. 8(1), 2-3.—The Test Anxiety Questionnaire (TAQ) was administered to 374 college students. 40 high anxious and 40 low anxious Ss were selected using the upper and lower 15th percentiles. The Holtzman Inkblot Technique (HIT) was administered to all Ss. No significant correlations were found among the TAQ and HIT, and no significant correlations were found for either sex among the HIT scales and the TAQ. It is concluded that more work is needed to establish the validity of the TAQ as a measure of test anxiety for college students and that the TAQ and HIT may be tapping different phenomena.—*J. A. Blazer.*

5005. Ward, William D. & Day, Charles R. (State University Coll. New York, Brockport) **Perceived similarity to parents as related to perceived similarity to other adults.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 739-742.—Administered the Role Construct Repertory Test to 109 male college juniors to investigate whether measures of perceived similarity to one's parents are equivalent to perceived similarity to adults in general. The former tended to be consistent with the measures of perceived similarity to some "other adults" and inconsistent with measures of perceived similarity to other "other adults." Thus, perceived similarity to parents may generalize to other adults because of common characteristics other than adulthood between parents and other adults. A sweeping generalization that measures of perceived similarity to parents are equivalent to perceived similarity to adults in general is not warranted.—*Journal abstract.*

(Cantini Center, Cardiological Clinic, Marseille, France) **Liste de cotation de formes pour le test Z individual.** [Lists of responses to images in the individually administered Z test.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(2), 111-138.—Presents tables of responses of a total of 500 20-60 yr. old normal Ss for the 3 plates of the Zulliger (z) projective test. More than 5500 responses are arranged according to categories of form.—*K. J. Hartman.*

5008. Csirszka, János. **A bellelészkes diagnosztikai vizsgálat a Thematic Apperception Test módosított értékelésével.** [Diagnostic examination of adjustment based on a modified evaluation of the Thematic

Apperception Test.] *Pszichológiai Tanulmányok*, 1968, No. 11, 657-675.—In the case of directed examinations, it is desirable to apply psychodiagnostic methods which, although aimed at giving a total personality picture, expose traits and functions which constitute the primary object of the survey. To facilitate the estimation of good adjustment, a construct system for the interpretation of TAT records was established. The critical points in the system reflect along the axis of sociability and emotionality, dynamic personality traits and functions, as well as the quality of the S's activity. With the help of this method the quantification of some of the qualitative scores is possible. Mean values were obtained from the standard examination of 17-18 yr. old secondary school girls, and valency of the TAT plates regarding the adjustment scores elaborated. (Russian summary)—*English summary*.

5009. Gill, H. S. (Tavistock Clinic, London, England) **A quantitative approach to the Word Association Test.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 4-6.—Presents a new method to assess the content of word associations. Stimulus words were selected on the basis of projective potential and meanings related to interpersonal relations and affect. Responses are assessed along the following 6 dimensions: (a) form of expression, (b) syntactical use of stimulus, (c) self and other references, (d) mode of communication, (e) affective tone, and (f) affective references. Reliability of judgment on the 1st 5 dimensions was above 80%.—*B. Beit-Hallahmi*.

5010. Kline, Paul & Gale, Anthony. (U. Exeter, Inst. of Education, England) **An objective method of administering a projective test: The Blacky Pictures.** *British Journal of Projective Psychology & Personality Study*, 1969(Dec), Vol. 14(2), 12-16.—Describes an objective method of administering the Blacky Pictures in a language laboratory setting. It appeared to overcome many of the objections to projective tests. Study of the reliability and the validity of the resulting scores indicate that it was a viable method.—*Journal summary*.

5011. Lavit, Ronald J. (Children's Medical Center, Tulsa, Okla.) **Variables underlying the perception of inkblots by low test anxious college students.** *Psychology*, 1971(Feb), Vol. 8(1), 16-18.—From a group of 374 college students, 40 low anxious Ss were selected from the lower 15th percentile of a distribution of Test Anxiety Questionnaire scores. The main factors which emerged in the analysis of these low test anxious Ss were (a) reality-oriented cognitive processes, (b) feelings of hostility and anxiety, (c) avoidance of both emotional demands and inner needs, (d) sexual preoccupation, (e) rejection of unstructured situations, and (f) inner-looking introspective concerns.—*J. A. Blazer*.

5012. Ombredane, P. A. **The "Congo T.A.T." of Professor André Ombredane.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 27-29.—Announces the new edition of the Congo TAT, designed as a projective technique for use with black Congolese. It is described as "the catechism of African psychologists."—*B. Beit-Hallahmi*.

Rorschach Test

5013. Campo, Vera & Jubert, Elena N. **Dissociation and M.** *British Journal of Projective Psychology & Personality Study*, 1969(Dec), Vol. 14(2), 17-22.—Good M responses on the Rorschach are assumed to be the

consequence of an adequate, "instrumental," degree of dissociation, proper to an integrated personality. Various definitions of dissociation under various conditions, and its relationship to M responses, are described. Dissociation is considered to have both positive and defensive functions, which would be reflected in Rorschach responses. These aspects of dissociation are illustrated by Rorschach responses from 2 protocols.—*B. Beit-Hallahmi*.

5014. Kaye, J. D. (Australian National U., Canberra, Australian Capital Territory) **Percept organisation as a basis for Rorschach interpretation.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 7-14.—Many Rorschach hypotheses have insufficient research validation but are nonetheless used as a basis for analysis and interpretation of the protocol. A system of assessment independent of these hypotheses and based on the test's nature as a perceptual task is discussed and illustrated. This system, which utilizes objectively measurable aspects of the Rorschach response is derived from the variability of perceptual processes along a continuum from developmentally inferior to developmentally superior levels of function. It provides a comparative method of assessment, useful particularly in the measurement of change over time.—*Journal abstract*.

5015. Kulcsár, Zsuzsanna. (Eötvös Lóránd U., Budapest, Hungary) **A percepció elhárítás egy fajtája Rorschach-válaszokban.** [A form of perceptual defense in Rorschach responses.] *Pszichológiai Tanulmányok*, 1968, No. 11, 701-709.—Described a specific form of response found in the Rorschach records of 19 Ss with anxiety hysteria in the course of clinical practice. It involves the phenomenon termed "growing dim—disappearing" and interpretations verbalized as "blurred." This class of responses seems to correspond to the data obtained by U. Kragh in his tachistoscopic experiments and may be considered as the expression of a form of perceptual defense. They are assumed to represent a specific and new form among the Rorschach scores, indicative of general perceptual defense. Ideas of or attempts at suicide having occurred in a significant percentage of the Ss, this type of Rorschach response, on the basis of the specific pathomechanism of the Ss, is considered to belong to the Rorschach suicide syndrome. (Russian summary)—*English summary*.

5016. Mérei, Ferenc. **A különleges reakciók a Rorschach-próbában.** [Specific reactions in the Rorschach Test.] *Pszichológiai Tanulmányok*, 1968, No. 11, 677-700.—Discusses the importance of a 5th column for scoring specific reactions in the Rorschach Test. These scores are considered to be delimitable phases of real psychic processes, i.e., models of reactions. Specific reactions have been grouped into 6 diagnostically important classes: (a) reactions corresponding to sensorimotor schemes (in the conceptual reference frame of H. Wallon, based on the observations of F. Minkowska): varied stereotypy, dilated secondary formula, enumeration of details, linking percepts; (b) signs of syncretic "mental form": infantile responses, juxtaposition, ideovisuality, molecule reaction, transparency (2 layers are assumed, either the upper layer is transparent or the lower layer shows through); (c) reactions of impulse neutralization and dereization: abstract verbalizations (Minkowska), noninterpretative stereotypes, bizarre verbalizations (Rapaport), dereization (increasing tendency of devitalization from plate to plate); revealing alienation, depersonalization, autism; (d) instability of the

conscious thought processes associated with interpretation, characteristic of the psychosyndrome of organic lesions; (e) paradox reactions (color denial, color dramatization, color projection), indicating emotional lability, suggestibility, exaltation, and hysteric symptom-formation; and (f) elaborative reactions: sthenic reaction and elaborations of tension, indicating the ability for cooperation and insight, and good prognosis for psychotherapy. (Russian summary) (32 ref.)—*English summary.*

5017. Potaky, Charles R. (Western Illinois U.) **Sources of utility in Rorschach interpretation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 469-470.—36 experienced clinicians interpreted 3 Rorschach protocols under conditions which controlled access to information. Clinicians could select any of 329 separate information items considered necessary and sufficient for answering clinical questions of Diagnosis, Anxiety, and Intelligence. Free Associations and Personal Data had highest utility, followed by such scores as Beck's F+%, R, P, M, C, CF, FC, and W scores. No single Rorschach score was found to have outstandingly high utility for any of the clinical questions. The usefulness of qualitative sources of information was contrasted with typical emphases on quantitative sources characteristic of past validation studies which have "failed" to demonstrate Rorschach validity.—*Author abstract.*

5018. Ring, E. (3 Kaltbrunner Str., Aillensbach, W. Germany) **Die Rorschach-Technik in der psychologischen Gesellschafts-Diagnostik.** [The Rorschach technique in the psychological diagnosis of groups.] *Psychologie und Praxis*, 1970(Oct), Vol. 14(4), 160-172.—Plate III of the Rorschach test was presented to a representative sample of 4000 individuals in Germany. Results indicate that the procedure can be used for a social diagnosis. The individuals who were asked to interpret the plate cooperated well and interviewers were able to obtain reliable measurements. Results of the research are given in 6 tables contributing to a validity estimate, Rorschach scales, and applicability of this procedure. Test administration was done on an individual basis.—*R. F. Wagner.*

5019. Tarantino, O. **Réponses banales congolaises au test de Rorschach.** [Popular responses of Congolese to the Rorschach test.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(3), 181-202.—Reports on popular responses to the Rorschach for 120 Ss chosen at random from the 1st- and 2nd-yr students in the University of Lovanium at Kinshasa, Congo. More than 3700 responses were classified to select those which were obvious to all Ss. The results provide a basis for establishing norms for Congolese and for comparison with other cultures. (27 ref.)—*K. J. Hartman.*

CLINICAL PSYCHOLOGY

5020. Hajtman, Béla. (Hungarian Academy of Sciences, Computer Centre, Budapest) **Egy diagnosztikai skála konstrukciójáról.** [On the construction of a diagnostic scale.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 285-291.—Presents a qualitative diagnosis on a nominal scale with classes of natural order, and an additional measurement related to the symptom on which the diagnosis was based. By fitting a linear regression model to these variables, the diagnosis on a

ratio scale can be scaled. In order to be able to develop this model, certain conditions under which the scale obtained constitutes a valid measure of a given diagnosis had to be defined; these conditions are listed. (Russian summary)—*English summary.*

5021. Illyés, Sándor. **A kóros pszichológiai jelenségek vizsgálatának néhány módszertani kérdése.** [Methodological problems in the investigation into pathological mental phenomena.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 459-475.—Stresses the necessity of fulfilling 3 requirements when assembling normal and abnormal experimental groups: (a) group differences must be ensured, (b) the abnormal group must be homogeneous and must represent the trait to be explored uniformly, (c) abnormal groups must be formed in such a way that normal-abnormal comparison should be made separately for the effect of each condition. In comparing performances of normal and abnormal groups, 3 typical situations are distinguished: (a) mental traits of normals and abnormals differ only quantitatively, i.e., the pathological condition is only a "weak" or "more defective" or "more developed" variant of the normal condition; (b) there are qualitative differences between normal and abnormal; and (c) there is structural divergence between psychological traits of normals and abnormals, although their achievement becomes identical through compensation. It is suggested that the comparison of normals and abnormals should in all 3 situations be executed differently. (Russian summary) (32 ref.)—*English summary.*

5022. Kubie, Lawrence S. (U. Maryland, Medical School, Baltimore) **The retreat from patients: An unanticipated penalty of the full-time system.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 98-106.—Describes the current retreat from contact with patients and analyzes several causes: (a) the painfulness of work with patients; (b) a general tendency to undervalue clinical skills; (c) a general failure to realize how long it takes to acquire clinical maturity; (d) the emphasis on research for tomorrow's medicine, at the expense of service for today's needs; (e) propaganda for service to the community; (f) higher academic rewards for everything but clinical skills; and (g) the tendency of top-rank full-time professors to set a bad example by their full-time absences. It is concluded that in no discipline is this trend as destructive or as prevalent as in psychiatry. (20 ref.)—*Journal abstract.*

5023. Kunitz, Stephen J. (U. Rochester, Medical School) **Equilibrium theory in social psychiatry: The work of the Leightons.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 312-328.—Attempts "to trace some of the intellectual roots that seem to have played a role in the development of the theoretical position of 1 important area of social and cross-cultural psychiatry, the body of work done by Alexander and Dorothea Leighton and their various co-workers..." and to assess "the explanatory value of this particular theoretical position." It is shown "(1) that the traditions from which this body of work draws have led to a conservative bias in the assumptions underlying the theory; and (2) that the theory itself is a series of hidden tautologies which in themselves do not really explain the reported empirical findings." (40 ref.)—*S. Knapp.*

5024. Moser, Hanna M. (Veterans Administration Hosp., Lyons, N.J.) **A ten-year follow-up of lobotomy patients.** *Hospital & Community Psychiatry*, 1969(Dec), Vol. 20(12), 381.—Reports a follow-up study on 134

patients who were lobotomized between 1944 and 1955. 25 Ss had died, 15 had been discharged, and 94 were still hospitalized. Evaluations of behavior showed a significant decrease in assaultive behavior, an increase in manageability, and an increase in ability to leave the hospital on pass for brief periods. However, almost $\frac{1}{2}$ the Ss experienced seizures, and intellectual loss was severe in 25%. That fewer than 10% were able to be discharged is regarded as indicating that the gains achieved by lobotomies are equivocal.—S. Knapp.

5025. Moussong-Kovács, Erzsébet. (Medical U., Budapest, Hungary) **Kutatás-etiikai problémák az orvosi pszichológia területén.** [Ethical problems in clinical psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 359-369.—Discusses a fundamental methodological dilemma of clinical research: to reconcile the aspects of moral responsibility and humanism with the seemingly contradictory demands of modern experimentation. Specific ethical issues arising in 4 spheres of therapeutical experiments are discussed. As an example of "sanguinean operations," examinations carried out by means of implanted deep electrodes, psychopharmacological and model-psychosis studies, investigations of stress, and psychodiagnostic methods employed in revealing unconscious contents are considered. An analysis of documents which specify the moral obligations of physicians from the research point of view and the ethical criteria in selecting Ss are included. (Russian summary)—*English summary.*

5026. Pethő, Bertalan. (Medical U., Budapest, Hungary) **Körforma, emberkép és teszt módszerek.** [Nosology, image of man and test methods.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 256-262.—Describes the advantages of a holistic, multidimensional approach to psychiatric research. (English & Russian summaries) (23 ref.)—M. Moore.

5027. Phillips, Derek L. & Clancy, Kevin J. (New York U.) **Response biases in field studies of mental illness.** *American Sociological Review*, 1970(Jun), Vol. 35(3), 503-515.—Discusses the possible influence of 2 response biases which may affect the validity of social science measures, i.e., social desirability and acquiescence, and reports the results of a pilot study concerning a psychiatric inventory used by several investigators. Analysis of data reveals that people's evaluation as to the "social desirability" of the inventory items is related both to their position in the status hierarchy and to their reports as to whether or not they have experienced the various symptoms constituting the inventory. Thus, the relationship between socioeconomic position and mental health is affected by people's evaluations as to the desirability of mental health inventory items. However, the findings also confirm that the existence of a relationship between socioeconomic position and disorder is not just a result of the hypothesized distortions arising from a response bias. (38 ref.)—*Journal abstract.*

5028. Rabkin, Richard. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Inner and outer space: Introduction to a theory of social psychiatry.** New York, N.Y.: W. W. Norton, 1970. 215 p. \$7.50.

5029. Rothman, Theodore. (Ed.) (U. Southern California, Medical School, Los Angeles) **Changing patterns in psychiatric care: An anthology of evolving scientific psychiatry in medicine.** New York, N.Y.: Crown, 1970. xxii, 296 p. \$7.95.—Presents the views of various authors prominent in the field of psychiatry concerning (a) historic evolution, present directions, and

evolving programs in psychiatric care; (b) perspectives in the treatment of schizophrenia and affective disorders; (c) new approaches to research and education; and (d) the interaction of biostatistics, empiric sociology, psychology, biology, and pharmacology.

5030. Strömberg, Erik. (Aarhus U., Århus, Denmark) **Psykkiske lidelsers frekvens og behandlingsbehov.** [The frequency of mental diseases and need of treatment.] *Nordisk Psykologi*, 1969, Vol. 21(1-2), 28-42.—Describes 3 demographic materials and stresses the need of planned economy because of the recent prospects of an optimal psychiatric care in Denmark. The advances of medical therapy were so great that a proper strategy would enable mental health personnel to offer adequate support and cure to the whole population if monetary investments were doubled to $\frac{1}{2}$ o/oo of the national income, i.e., postponing color TV 5 yr. The results from the 5-yr investigation of the island of Samø with 6000 inhabitants representative of the rural population are of special interest. General practitioners referred more severe cases to psychiatrists who visited the island regularly and 2% were examined. Of these 472 only 11% needed institutional treatment, $\frac{1}{2}$ of the rest could be handled by the general practitioner. An optimal mental care in Denmark would require 1 psychiatrist, 1 mental health nurse, 1 social worker, and $\frac{1}{2}$ psychologist per 20,000 inhabitants for outpatient services. Institutional work requires another psychiatrist but children are not taken into consideration here. It amounts to a doubling of psychiatrists and a heavy need for psychologists.—P. Mylov.

5031. Westbury, David G. (H. M. Prison, Durham, England) **Forensic psychiatry in Britain: Its potentials.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 165-176.—Considers that psychiatry today is at the level of general medicine around 1900. Public opinion, in advance of psychiatric knowledge, has forced legislation to take note of deviant behavior. The more carefully offenders are studied, the more abnormality is discovered. The captive population of our prisons could provide the most interesting multidisciplinary study material. It is suggested that regional centers of psychiatry and new types of hospitals be set up, and methods of clinical assessment that may form a basis for prognosis and individualized rational treatment be developed. (French, German, & Spanish summaries)—*Journal summary.*

PERSONNEL

5032. Balsam, Alan & Garber, Norton. (Yale U., Medical School) **Characteristics of psychotherapy supervision.** *Journal of Medical Education*, 1970(Oct), Vol. 45(10), 789-797. Analyzed the responses of 59 psychiatric residents who completed questionnaires about 76 supervisors. 5 meaningful and independent characteristics were identified. 3 concerned with patterns of emphasis in supervision (psychodynamic aspects of psychotherapy, clinical management, and group therapy) and 2 with personal style (warm and active). Each supervisor was perceived as having each of these characteristics in varying degrees. It is concluded that these characteristics represent independent scales by which individual supervisors may be evaluated, and that they are not necessarily at variance or incompatible with each other. The wider application of this method to the study of professional training is discussed.—*Journal summary.*

5033. Bradley, Eloise K. (U. Oregon) **A study of the role expectation for attendants in a state institution for the mentally retarded.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3369.

5034. Comba, Cecilia Y. (U. Oregon) **A study of the role expectation for attendants in a state institution for the mentally retarded.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3370-3371.

5035. Crow, C. M., Mowbray, R. M., & Bloch, S. (U. Melbourne, Australia) **Attitudes of medical students to mental illness.** *Journal of Medical Education*, 1970(Aug), Vol. 45(8), 594-599.—Tested 90 5th-yr medical students with 3 scales from the Opinions about Mental Illness (OMI) Scale before and after a 6-wk training course in psychiatry. Personality test scores were available from the Eysenck Personality Inventory and the Complexity of Thinking and Social Introversion scales of the Omnibus Personality Inventory. Ss showed significant changes following training in the direction of attitudes held by the staff members. Ss who held extreme views on the 3 OMI scales were contrasted. Findings were consistent with the existence of an authoritarian attitude in certain students who were less likely to change following training. It is suggested that such students be identified and that methods be developed for their more effective instruction.—*Journal summary*.

5036. Dyer, Elaine D., Monson, Mary A., & Van Drimmelen, Jennie B. (U. Utah) **Does age, education, and administrative position reflect in CPI scores?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 573-574.—Studied the relationships of administrative position, age, educational preparation, and the 18 CPI scales in 1018 randomly selected registered nurses from 31 Veterans Administration Hospitals. Significant correlations ($p < .05$) were found between: (a) administrative position and Do, Re, Sc, Ai, Py, and Fx; (b) age and -Sy, -Sp, -Sa, -So, Sc, Gi, -Cm, -Ai, -Ie, and -Fx; and (c) educational preparation and Do, Cs, Sy, Sp, Sa, To, Ai, Ie, Py, and Fx. Eta coefficients indicated that relationships with the CPI scales were linear. Administrative position, age, and educational preparation were not highly intercorrelated. Highest profiles were obtained by older Ss with master's degrees in supervisory positions.—*Author abstract*.

5037. Gardner, James M. & Giampa, Franklyn L. (Orient State Inst., O.) **The Attendant Behavior Checklist: Measuring on-the-ward behavior of institutional attendants.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 617-622.—Examined the reliability and validity of a time-sampling technique for measuring on-the-ward behavior of attendants ($N = 20$ 19-42 yr. old females) in a state institution for the retarded. An 11-category behavior checklist was constructed from previous work by Bensberg and Barnett. High interscorer, test-retest, and split-half reliabilities were found. Regular attendants behaved differently than behavior modification trainers; however, there were no significant differences between the trainers judged (by their supervisors) to be high or low in overall competence. The relationship between on-the-ward behavior and attitude, knowledge of mental retardation, and ability to apply behavior modification techniques was also examined. (15 ref.)—*Journal abstract*.

5038. Hyams, Lyon, et al. (William Alanson White Inst., New York, N.Y.) **Varied needs of primary physicians for psychiatric resources: I. Behavioral**

indices. *Psychosomatics*, 1971(Jan), Vol. 12(1), 36-45.—The traditional medical model of specialized technical intervention and somatic focus governs the priorities of physicians for involvement with the emotional problems of their patients. Conservative medical techniques, e.g., physical examinations with reassurance, are preferred. To gather more information about the primary physician, an 84-item self-administered questionnaire was designed to provide data about (a) self-reported behavior with patients with emotional problems, and (b) subjective attitudes and needs. The questionnaire was sent to all primary physicians ($N = 610$) in 2 geographically distinct hospitals. Return rates were 50 and 74%. Surveyed physicians showed inadequate use of (a) psychotropic drugs, (b) referrals to private psychiatrists, and (c) community facilities. While most physicians indicated their willingness to treat more patients with emotional problems, it is inferred that the present system of relationship between the primary physician and the psychiatrist does not meet the needs of many of these physicians.—*Journal summary*.

5039. Krakowski, Adam J. (Champlain Valley-Physicians Hosp., Medical Center, Plattsburgh, N.Y.) **Doctor-doctor relationship.** *Psychosomatics*, 1971(Jan), Vol. 12(1), 11-15.—Discusses aspects of the doctor-doctor relationship, defined as a triadic process involving 2 physicians and a patient during diagnosis and therapeutic transaction, and compared to transference and counter transference. Psychodynamic formulations suggest that the physician is motivated in choosing his profession by the need to counteract his fear of death; this task is accomplished through desensitization, denial, and rationalization. The mastery of anxiety is decisive in the quality of medical success. The satisfactory resolution of the unconscious fear of death is also responsible for the positive doctor-doctor relationship. (15 ref.)—*Journal summary*.

5040. Naftulin, Donald H., Ware, John E., & Myers, Vincent H. (U. Southern California, Medical School, Los Angeles) **Psychiatrist interest in continuing education.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 260-264.—Describes the results of 2 surveys of 1062 Southwestern psychiatrists' interests in continuing education course content, format, scheduling, and fees. Of 55 specific subject choices offered respondents, interest was greatest in (a) preparation for board examination, (b) adolescent psychiatry, (c) psychiatry and law, (d) community psychiatry, and (e) psychosomatic medicine. It is suggested that the survey results may serve as a tentative guide for course offerings and the survey form as a model for repeated surveying of psychiatrists' continuing education interests in other parts of the country. Current concerns about the adequacy with which board examination passage reflects clinical competence, the difficulty in defining clinical competence, and the trend toward mandatory continuing education for physicians are discussed. The high interest of board-eligible psychiatrists in board preparation courses suggests that intensive review courses in psychiatry might serve as effective incentives for continuing education. (17 ref.)—*Journal abstract*.

5041. Perry, Gwenda. **The shortage of occupational therapists in psychiatric hospitals.** *Australian Occupational Therapy Journal*, 1970(Apr), Vol. 17(2), 12-13.—Considers the shortage of occupational therapists in Australian psychiatric hospitals and the possible reasons for this shortage. An ongoing program of occupational

therapy in a psychiatric hospital is described. It is concluded that there is a need for occupational therapists and that they should involve themselves more in the treatment of psychiatric illness.

5042. Shearn, Charles R. & Fitzgibbons, David J. (Inst. of Living, Hartford, Conn.) **Theoretical orientation of mental health professionals as a function of professional discipline and length of experience.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 230.—Found a significant relationship between professional discipline and theoretical orientation in a sample of 183 mental health professionals. Clinical psychologists emphasized nondynamic and eclectic orientations; psychiatric social workers tended to identify with the psychoanalytic viewpoint; and psychiatrists were over-represented in a catch-all "other" category. In the latter case, length of experience became significant, with less experienced psychiatrists being listed as "other" for giving no theoretical orientation, and more experienced for giving multiple orientations.—*Author abstract.*

5043. Smyth, Veronica & Thomas, David R. (Mater Misericordiae Hosp., Brisbane, Australia) **Effects of nursing training on attitudes toward psychiatric patients.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 34.—Administered a 26-item questionnaire to 50 1st- and 50 3rd-yr nurses. The senior nurses held significantly more favorable attitudes toward psychiatric patients ($p < .001$). An estimate of variance from the t ratio showed that the between groups variance accounted for approximately 90% of the total. Results suggest that professional nurses' training significantly affects attitudes toward psychiatric patients.—*Author abstract.*

5044. Suess, James F. (U. Mississippi, Medical School, Jackson) **Self-confrontation of videotaped psychotherapy as a teaching device for psychiatric students.** *Journal of Medical Education*, 1970(May), Vol. 45(5), 271-282.—Describes a program using 15-min videotapes of psychiatric interviews by students for self-confrontation, (a) by the student alone, (b) in the supervisory session, (c) by the student with his peer group, and (d) by the student with his patient. It is concluded that this system allows for more accurate, objective evaluation of the student's strengths and weaknesses as a therapist and that this is experienced more clearly and vividly than the usual written notes or verbal recollections of the interview. The limitations of the system are noted.—*Journal summary.*

PSYCHOTHERAPY & ANALYSIS

5045. Abramovitz, Carole. (U. Cape Town, South Africa) **Beyond empiricism.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 137-138.—Suggests that the question of goals in psychotherapy is a value-laden choice that is logically prior to the choice of techniques. It is argued that techniques whose outcome is not empirically verifiable should not necessarily be rejected.—*Journal abstract.*

5046. Balint, Michael. **Research in psychotherapy and the importance of the findings for psychoanalysis.** *Revue de Médecine Psychosomatique et de Psychologie Médicale*, 1970(Fal), Vol. 12(3), 225-240.—Tested new techniques to teach physicians to deal psychotherapeutically with their patients in a brief period of time. A case report of a 68-yr-old single female is presented. The new technique, in contrast to the

traditional psychoanalytical approach and an unsuccessfully attempted "focal" technique, consists of tuning in to the patient's wavelength of communications so exactly that S will be able to respond accurately.—*R. Naar.*

5047. Canter, Francis M. (Eastern Michigan U.) **Authoritarian attitudes, degree of pathology and preference for structured versus unstructured psychotherapy in hospitalized mental patients.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 231-234.—95 men and 125 women mental hospital patients indicated preference for relatively structured (lectures) vs. relatively unstructured (group discussions) psychotherapy, each of which the patient experienced in the hospital. Preferences were related to the Ss' degree of authoritarianism as measured by the California F Scale and degree of mental pathology as measured by the MMPI. Social class was held relatively constant, since all Ss were of lower-middle or lower class. Authoritarianism was higher in Ss preferring the structured approach but degree of pathology was not consistently distinguishing. It is concluded that the personality of the patient can be an important factor in considering the kind of psychotherapeutic approach to be used.—*Journal abstract.*

5051. Hau, Theodor F. (German Psychoanalytic Society, Inst. for Psychoanalysis & Psychotherapy, Freiburg, W. Germany) **Strukturierung des psychoanalytischen Prozesses: Zur heutigen Lage der psychoanalytischen Therapie.** [Structuration of the psychoanalytic process: The current situation of psychoanalytic therapy.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Jan), Vol. 16(1), 41-52.—Discusses the dynamics of the analytical situation, the structuration of the psychoanalytic process and their foundations. Psychoanalysis as a diagnostic and therapeutic method, in the course of its development as a science (not as a dogma), has become more and more differentiated and intensified. As the so-called classical method, it still is best suited to examine and change personality in the direction of the genital character (Freud), the productively-oriented personality (Fromm), or the autonomous man (Schulz-Henkels). As a classical method its indication is relatively narrow. Only 30% of all patients in need of psychotherapy are capable of being analyzed. Another 30% can be treated with psychotherapeutic methods and be made analyzable. The form of therapy has to vary depending on the treatment goal and type of patient. The main efficacy of psychotherapy should not be seen in or expected from therapy but prophylaxis, i.e., psychohygiene, pedagogies, and any kind of social work. It is suggested that in the future, more psychoanalysts besides their practical psychotherapeutic activity should effectively apply the knowledge of psychoanalysis to these prophylactic areas. 5052. Hau, Theodor F. & Messner, Kurt. (U. Freiburg,

Medical Clinic, W. Germany) **Zur Psychosomatik und stationären Psychotherapie bei Patienten der ersten und der zweiten Lebenshälfte.** [Psychosomatics and inpatient psychotherapy with patients in the first and second halves of life.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Apr), Vol. 16(2), 157-164.—In the psychosomatic department of a university clinic, patients (16 yr. old and older) were given psychotherapeutic treatment based on psychoanalysis. From the psychological aspects, the 1st 1/2 of life was set at age 1-30 and the 2nd 1/2 beginning at 40. Patients of both groups differed in the accumulative occurrence of certain diseases and some Hawie IQs. Male patients of the 2nd 1/2 of life scored higher in overall, verbal, and action intelligence. There was no difference between women of both groups, and patients showed no differences in the Hawie intelligence profile. In patients hospitalized with chronic illnesses, the quick response to symptomatic measures seems to have a causal connection. There was no dependency between the degree of chronicity and the intelligence level as well as intelligence profile in the Hawie test. In the selection of persons for inpatient psychotherapy by ambulatory preexamination, patients of the older group seem to make up for the prognostically unfavorable factor of advanced age by a higher level of intelligence.—*B. Schay.*

With regard to prognostic factors, the personal attitude of the psychotherapist and the importance of his theoretical position is stressed. Positive results depend on (a) the empathic abilities of the therapist, on his quick grasp of and access to the evolutionary potentials; (b) on the child possessing a minimal ability to enter into interpersonal relations, and on his ego being at least partly intact; and (c) also on environmental factors, i.e., the personality of the parents and their readiness to cooperate. In the age group investigated the ratio of actual-neurosis and actual conflict were relatively high. Methods of prevention are recommended. Some aspects of these methods are dealt with, and the question of spontaneous remission and its different forms treated. Data derived from comparing prognostic assumptions with experiences gained in actual treatment are given. Validity of assumptions made have been checked by means of katanemistic procedures. If the clinician is to introduce his laboriously developed skills and conceptual tools into this new arena, he must be able to grasp the theoretical as well as the practical interrelationships between individual and institutional change.... It would, of course, be a gross oversimplification to suggest that the pathology or symptom manifested by an individual is simply, or only, a reflection of conditions in the school, educational system, industry, or job market.... 1 of the ways the clinician can appraise such matters is by examining the functioning of 1 or another of the small-group structures through which the individual participates in the life of the school, industry, or hospital, even though such an institution may involve thousands of people.... Study of the supporting community subsystems gives the clinician access to a world in which he is more at home. He can turn from a telescopic view of the whole vast area to be served to a low-powered delineation of neighborhoods, and finally, to the scrutiny of the small-group subsystems which are the critical component structures of these larger, less manageable psychosocial entities.... the competent clinician generally insists on seeing, hearing, smelling, and experiencing the human beings and the human institutions which he must effectively appraise and genuinely understand if he is to be really helpful.... The mental health professions have begun to accept their responsibility for understanding and influencing both individuals and institutions, but the body of knowledge and practices to enable them to function effectively over such a broad range is far from complete."—*J. Linnick.*

5057. **Pohlen, M.** (Max-Planck Society for Psycho-pathology & Psychotherapy, Munich, W. Blum and G. H. Graber. The 1st convention took place in 1961. The theme of all conventions has been the "basic conflict" in psychoanalytic theory. Since the dispute between Freud and Rank, this subject of the oedipal conflict constellation as "basic conflict" in contrast to the hypothesis of birth anxiety has not been discussed by the psychoanalytic schools. It is practically banned. Garber has dealt with the psychoanalytic anxiety and drive theories while Blum has linked psychoanalysis with phenomenology and opened phenomenological knowledge to psychoanalytic thinking. The Freudian concept of psychoanalysis as argued by the different members of the workshop is discussed. The 1968 convention emphasized the dialectic relationship of ego and self, of person and world, of development and growth. The Bern and Innsbruck conventions present a new approach to Freud.—*B. Schay.*

5063. Boll, Thomas J. (U. Washington, Child Development & Mental Retardation Center) *Systematic observation of behavior change with older children in group therapy.* *Psychological Reports*, 1971(Feb), Vol. 28(1), 26.—Utilized the techniques of R. H. Dana and J. M. Dana (see PA, Vol. 43:14416) to assess the effects of therapist style on children's behavior. 2 groups of 4 or 5 8-11 yr. old children were observed for 10 wk. Ss' behavior was rated for watching, movement, play alone, play with others, vocalization, and speech toward others. Aggressive behavior was rated separately. Results were opposite to those found by Dana and Dana: Ss treated by the nondirective therapist increased their amount of play, vocalization, speech, movement, and hostile, aggressive behavior.—*S. Knapp.*

5064. Fidler, Jay W. (Union County Psychiatric Clinic, Plainfield, N.J.) *The relationship of group psychotherapy to "therapeutic" group approaches.* *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 473-494.—The American Group Psychotherapy Association (AGPA) Task Force definition of psychotherapy is considered restrictive because "it limits us to consideration of those professional relationships in which a health professional with responsibilities for assuring that diagnosis and planning of therapy have occurred comes into contact with patients who acknowledge that they are looking for change with the person consulted and the method (group) being employed . . ." Fulfilling part of the requirements of this definition are groups of patients in "art therapy, dance therapy, occupational therapy, pastoral counseling, remotivation groups, and several others." Also aiding expression are the T groups and the emotional confrontation groups (Daytop and Synanon). These groups, helpful to patients, are designated as having a mental hygiene approach and are characterized as "therapeutic." "Since the use of different groups requires different degrees of training, we shall be increasingly confronted with the definition of legitimate qualifications for each type of procedure." The role of AGPA in relating to *kérdései*. [Theoretical and practical considerations bearing on the applicability of puppetry as a group therapeutic method in the treatment of chronic schizophrenic patients.] *Pszichológiai Tanulmányok*, 1968, No. 11, 753-764. Puppetry has been employed as a group therapeutic method with chronic schizophrenics. Results may be attributed to a number of different factors, the most important of which appears to be the influence of the group on the individual. Preparations for the show require activities involving useful experience for the patients. There arises a kind of competition which, by stimulating the activity of the Ss, contributes to a favorable therapeutic atmosphere. This positive group atmosphere improves contact with the external world by emphasizing the ideas of normal, practical life. Puppetry executed at a high level requires serious, concentrated work. The acquisition of its technique is just as rewarding as the performance of productive work. Playing bears on the evolution of mechanisms regulating behavior, as its subject-matter reflects part of reality. Puppetry, being an organized form of role-playing, reflects a particular section of real life. By stimulating the imagination of the Ss with the help of the artistic impressions, and by requiring them to find autonomous solutions for certain tasks, a specific improvement involving the total personality may be achieved. (Russian summary) (38 ref.) *English summary.*

these groups and their methods is explored. (56 ref.)—*I. Linnick.*

5065. **Fried, Edrita.** (55 E. 86th St., New York, N.Y.) **Individuation through group psychotherapy.** *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 450-459.—Os and interpreters of group dynamics describe the normal sequence of phases to be expected in groups as "narcissistic," "inclusion," "power," and "intimacy." It is rare for individuation and self-originated strength and power to occur in all members of the group at the same time. A "schemata of group dynamic movement is useful... to help the therapist to make diagnostic distinctions... between hostility that derives from the frustration of passivity and hostility mobilized to fortify the patient's ego during the power struggle." What happens during the individuation-strength-power phase is described, and the differentiation between "tantrum anger" and "opposition anger" is discussed. "Group members who seek individuation need not be asked to weigh the content of their complaints but the process. The process is to become separated, individuated, to acquire strength, to try out one's own wings. What is at first accomplished through frequently unwarranted though fairly reasoned attack is later achieved through genuine strength."—*I. Linnick.*

5066. **Hallowitz, Emanuel.** (U. Chicago, School of Social Service Administration) **The challenge to the group psychotherapist created by a society in flux.** *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 423-434.—Happenings in society can be viewed either as a threat to our competence, to our established way of functioning, to our sense of status or importance, or they can be seen as an opportunity and a challenge—a challenge to broaden our vision and deepen our understanding, a challenge to our creative abilities to develop additional ways to serve our fellow men. (32 ref.)—*Journal summary.*

5067. **MacGregor, Robert.** (Dept. of Mental Health, Family Studies, Chicago, Ill.) **Group and family therapy: Moving into the present and letting go of the past.** *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 495-515.—The family therapist, as an agent of change, meets with an established concern that has as its trouble such a relationship among subsystems that it reverberates unproductively, wearing out or otherwise sacrificing its parts instead of processing growth-enhancing experiences. The therapist consults with the family members to help redefine the interrelationships. He brings with him a respect for living systems and a confidence that the "hang-up" had a history understandable to amateurs. By this respect (or reverence for life) and his interest in the study, he engages the personnel, recognizing their responsibility according to developmental status and their task according to the stage of the family life cycle, while at the same time recognizing the collusion in which they join to protect themselves from presumed inferiorities. The relationship between group therapy and family therapy, then, is analogous to that between a relatively closed and a relatively open system. The family therapists choose not to have more than a loose federation of regional interest groups for fear that privileged entrée to their own journal and the creeping rigidity of standards of acceptability might freeze the goose that laid the golden egg.—*Journal summary.*

5068. **Pattison, E. Mansell.** **Group psychotherapy and group methods in community mental health**

programs. *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 516-539.—In terms of social system concepts, group psychotherapy as defined earlier by the American Group Psychotherapy Association Long-Term Policy and Planning Commission represents 1 position of intervention (or a close cluster of positions) along a spectrum of interventions. In this perspective, a variety of group methods, group goals, group members, and group leaders may be employed in the social system that is termed a community mental health program. How close or distant a particular group intervention is to the definition of group psychotherapy becomes irrelevant. Rather, the issues turn to those of appropriate selection of group members, techniques, goals, and leaders, according to the point in the social system in which one plans to intervene and to what purpose.—*Journal summary.*

5070. **Schwartz, Arthur H., et al.** (Yale U., Medical School) **Influence of therapeutic task orientation on patient and therapist satisfaction in group psychotherapy.** *International Journal of Group Psychotherapy*, 1970(Oct), Vol. 20(4), 460-469.—The group therapy meetings of 4 different therapists were systematically studied to determine the influence of task orientation (discussion of therapy-oriented topics) in relation to patient and therapist satisfaction in group psychotherapy. A total of 120 group sessions, 30 for each group, was rated by the therapists and patients involved to determine their satisfaction with each group session and their assessment of the amount of productive or therapeutic work that had been accomplished. A questionnaire including 29 variables, each assessed on 6-point rating scales, was used to obtain data. When patients and therapists felt that task-oriented (therapeutic) work had occurred, they were found to be satisfied with their group therapy session. Patients' assessments of useful work and therapists' statements of useful work were related significantly for 3 of 4 variables dealing with task orientation. The value system of the setting to which patients and therapists worked seemed to be instrumental in influencing the common orientation and consensus of patients and therapists. The hypothesis of Heslin and Dunphy about task orientation in small-group settings was found to be valid in group psychotherapy with emotionally disturbed patients.—*Journal summary.*

Behavior & Conditioning Therapy

5071. **Berecz, John M.** (Indiana U.) **Reduction of smoking through self-administered aversion conditioning of imagined behavior.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 429-430.—Investigated the therapeutic feasibility of self-administered punishment of imagined behaviors. It was predicted that punishing imagined behaviors would suppress corresponding overt behaviors. Students were assigned randomly to 1 of 5 groups. In 1 group, delivery of self-administered shock was contingent upon imagined smoking, while in another group it was contingent upon actual smoking. Controls were provided by minimal-contact, wait, and placebo groups. The data were inconclusive for female Ss. For moderately-smoking males, the actual-smoking and

imagined-smoking treatments were effective, but not differentially so. With heavy-smoking male Ss the only highly effective therapy was the imagined-smoking treatment.—*Author abstract.*

5072. Cautela, Joseph R. (Boston Coll.) **Covert negative reinforcement.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 273-278.—Describes covert negative reinforcement which is designed to increase the probability of a response by instructing an S to imagine an aversive event and to terminate it by imagining the response to be increased. Examples of the applications of the procedure to maladaptive avoidance and approach behaviors are presented. The relation of the procedure to the escape conditioning paradigm is discussed. (37 ref.)—*Journal abstract.*

5073. Gentry, William D. (Duke U., Medical Center) **In vivo desensitization of an obsessive cancer fear.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 315-318.—Describes the case of a 26-yr-old woman with a severe case of an obsessive cancer fear of acute onset. Attempts at standard desensitization did not lead to any decrease of anxiety in relation to physical contact with the patient's breasts. A change to in vivo breast stimulation in the relaxed state produced rapid progress.—*Journal abstract.*

5075. Herman, Steven H., Barlow, David H., & Agras, W. Stewart. (U. Mississippi, Medical Center) **Exposure to heterosexual stimuli: An effective variable in treating homosexuality?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 699-700.—A 24-yr-old homosexual was sequentially exposed to films of female or male sexual content under positive therapeutic instructions. During the exposure to female movie phase, the patient's penile response to slides of females in test sessions increased over base-line levels. Subjective report of arousal as well as heterosexual behavior outside the laboratory also increased. During the male exposure phase, subjective measures increased, following expectancies created by instructions, while the objective measure decreased. Heterosexual responding increased again when the female phase was reinstated. Results are discussed in terms of exposure facilitating extinction of avoidance responses toward females.—*Author abstract.*

5076. Herrell, James M. (Montgomery County Health Dept., Rockville, Md.) **A use of systematic desensitization to eliminate inappropriate anger.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 431-432.—Describes the use of systematic desensitization to eliminate inordinate anger and overt aggression. A 19-yr-old soldier with a lifelong problem of becoming excessively angry when given commands was treated using standard systematic desensitization procedures except for a change in the hierarchy. Based upon the assumption that a person cannot be both angry and relaxed, anymore than one can be anxious and relaxed, a hierarchy consisting of anger-producing situations was developed. Significant improvement occurred, and it is concluded that systematic desensitization can be a valuable tool in dealing with anger.—*Author abstract.*

5077. Jacobs, Alfred; Edelman, Mari, & Wolpin, Milton. (West Virginia U.) **Effects of differential**

anxiety level and the repression-sensitization dimension in desensitization therapy. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 427-428.—3 reliably different levels of anxiety produced in Ss during cognitive rehearsals of approaching feared objects did not lead to differential decreases of avoidance or fear in the presence of the feared object. Ss designated as repressors on the Byrne Repression-Sensitization scale improved least. The amount of fear reported by repressors during visualization was substantially related to ineffectiveness of treatment, and fear and avoidance were highly related. Similar results were not obtained from sensitizers or an intermediate group. Items in a fear history questionnaire were significantly related to amount of avoidance after treatment.—*Author abstract.*

5078. L'Abate, Luciano. (Georgia State Coll.) **La stanza da gioco automatizzata: Una tecnica comportamentistica per la ludoterapia infantile.** [Automatized playroom: A behavioral technique for child game therapy.] *Bollettino di Psicologia Applicata*, 1968, No. 88-90, 43-54.—Studied a controlled playroom of the Child Development Laboratory of Georgia State College in detail, outlining possibilities. It is concluded that this type of playroom comprised of 2 rooms is beneficial. The separation of material and conceptual techniques produces effects which can be verified to a greater extent. In these rooms the child's behavior can be controlled and modulated in a manner that could not be achieved in the traditional playrooms.—A. M. Farfaglia.

5079. Marquis, John N. (Veterans Administration Hosp., Palo Alto, Calif.) **Orgasmic reconditioning: Changing sexual object choice through controlling masturbation fantasies.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 263-271.—Reports that sexual responses can become attached to formerly neutral stimuli by pairing them with masturbation. The history of using this model to explain perversions and to modify choice of sexual object is discussed along with theoretical considerations. A procedure for eliminating perversions through careful programming of masturbation fantasies is described and results for 14 cases are given. (19 ref.)—*Journal abstract.*

5080. Miller, Arnold L. (Champaign County Mental Health Center, Ill.) **Treatment of a child with Gilles de la Tourette's syndrome using behavior modification techniques.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 319-321.—Describes the use of behavioral modification techniques to ameliorate symptoms of Gilles de la Tourette's syndrome in a 5-yr-old boy. Both the boy's parents and his school teachers were used as aids in carrying out the therapy, whose main feature was rewarding nonperformance of the undesirable behavior. The case suggests that parents can treat Gilles de la Tourette's syndrome in the home under appropriate professional supervision.—*Journal abstract.*

5081. Mitchell, Kenneth R. (U. New South Wales, Sydney, Australia) **Note on treatment of migraine using behavior therapy techniques.** *Psychosomatic Reports*, 1971(Feb), Vol. 28(1), 171-172.—Assigned 2 female and 4 male undergraduates who suffered from migraine attacks to 2 groups. Group A Ss were individually treated by a combination of behavior therapy techniques, systematic desensitization, assertive therapy, and reeducative training. Group B Ss received no treatment. Measures taken for each S over 3 8-wk

periods indicated a significant reduction in the frequency and pain level of the migraine attacks for the experimental group.—*S. Knapp.*

5082. Moss, Gene R., Rada, Richard T., & Appel, James B. (Walter Reed Army Inst. of Research, Washington, D.C.) **Positive control as an alternative to aversion therapy.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 291-294.—The control of undesirable behaviors by aversive techniques under the label "aversion therapy" has become an increasingly prominent behavior therapy. The attention given to these techniques is a measure of resistance of disorders, e.g., sexual deviations to more traditional therapies. Although effective in the animal laboratory, aversive control applied clinically may not be entirely appropriate. Some theoretical and practical drawbacks to aversion therapy are discussed, and an alternative is suggested in the use of positive behavioral control. The treatments of 2 cases of transvestism by aversive and positive control therapy are presented.—*Journal abstract.*

5083. Nawas, M. Mike & Pucel, John C. (Indiana State U.) **Relationship factors in desensitization: A persistent trend.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 239-243.—Explored the relevance to the outcome of desensitization of same-sex and opposite-sex pairings of Ss and Es. 12 groups of 8 undergraduates each, consisting of all S-E same- or opposite-sex combinations were employed. Confirming the findings of an earlier work that S-E sex pairing is irrelevant, this study revealed, however, significant differences between the pseudodesensitization and the no treatment control groups. It is concluded that the inclusion of pseudodesensitization groups in experimental studies is imperative, and that the role of relational factors is by no means a closed issue. (19 ref.)—*Journal abstract.*

5084. Seitz, Frank C. (Montana State U.) **A behavior modification approach to depression: A case study.** *Psychology*, 1971(Feb), Vol. 8(1), 58-63.—Describes the treatment of a neurotically depressed 36-yr-old white, widowed male, hospitalized following a suicide attempt, using a combination of 4 behavior modification techniques: Wolpe's relaxation and desensitization, and assertive training techniques; Premack's differential probability hypothesis; and Lazarus' behavioral deprivation and retraining. "At the end of 8 hourly sessions, the patient showed dramatic improvement according to staff reports, psychological tests, and his own self reports." (16 ref.)—*S. Knapp.*

5085. Seitz, Frank C. (Montana State U.) **Behavior modification of depression.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 425-426.—The therapeutic impact of psychotherapy in its various forms on depression is frequently assumed and occasionally demonstrated. 1 such experimental offshoot of psychotherapy, behavior modification, claims to offer a variety of techniques which alter "depressive behaviors." To date there has been no systematic presentation of these techniques as they relate to depression. This paper offers a conceptualization of clinical-depression from a behavior modification viewpoint. A discussion and critique of the current research involving the application of operant and classical conditioning techniques to the treatment of clinical depression is presented. Problems involved in conducting such research are briefly outlined.—*Author abstract.*

5086. Tahmisian, James A. & McReynolds, William T. (U. Kentucky) **Use of parents as behavioral engineers in the treatment of a school-phobic girl.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 225-228. Reports a case study of a 13-yr-old school phobic girl successfully treated by her parents with instrumental behavior-shaping treatment procedures. Excluding the therapist's initial assessment with the child and an unsuccessful attempt with systematic desensitization, total treatment time was 3 wk. and total time expenditure of the therapist was approximately 2 hr. 90 min. for instruction and training of the parents and 10 min. for each of 3 subsequent follow-up telephone calls.—*Journal abstract.*

5087. Van Egeren, Lawrence F. (Louisiana State U. Medical Center, New Orleans) **Psychophysiology of systematic desensitization: The habituation model.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 249-255.—30 male undergraduate and graduate students with public speaking phobias imagined phobic and neutral scenes repeatedly while 6 autonomic responses were monitored. 6 predictions derived from the physiological habituation model of anxiety desensitization of M. Lader and A. Mathews (see PA, Vol. 43:10064) were tested. However, the aim of the study was to examine the generality of the habituation model rather than to replicate research. Habituation rate was positively correlated with (a) resting activity (magnitude and frequency of skin conductance reactions) (b) affective intensity of phobic scenes (digital pulse amplitude and frequency of skin conductance reactions), and (c) relaxation (digital pulse amplitude) and negatively correlated with reactivity (respiratory rate). Habituation rates were unrelated to pervasiveness of fear. Habituation rates for neutral and phobic stimuli were positively correlated (frequency of skin conductance reactions). The habituation model of desensitization was given little support. (17 ref.)—*Journal abstract.*

5088. Wahler, Robert G. & Cormier, William H. (Tennessee) **The ecological interview: A first step in out-patient child behavior therapy.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 279-289.—Discusses the importance of interview information in child behavior therapy with particular reference to ecological information. An illustration of a preinterview checklists is provided. The ecological interview is described in detail and its function in the construction of behavior therapy programs is discussed. A case study of a 10-yr-old boy is presented to illustrate features of the interview. (16 ref.)—*Journal abstract.*

5089. Wickramasekera, Ian. (Peoria Mental Health Clinic, Ill.) **Desensitization, re-sensitization and desensitization again: A preliminary study.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 257-262.—Describes the treatment of a 41-yr-old white male S who was referred for treatment of obsessive-compulsive sexual behavior. When desensitization was applied to S's anxiety reactions to images of the theme of "infidelity" by his wife, his obsessive compulsive behavior progressively diminished. High anxiety stimuli were prematurely introduced into the treatment and the obsessive compulsive behavior recurred. A resumption of desensitization and the standard progression of scene presentations was successful and treatment was completed in the 24th wk.—*Journal abstract.*

5090. Yen, Sherman & McIntire, Roger W. (Baltimore City Hosp., Children & Youth Clinic, Md.) **Operant**

therapy for constant headache complaints: A simple response-cost approach. *Psychological Reports*, 1971(Feb), Vol. 28(1), 267-270.—Describes a procedure based upon simple response cost approach to weaken constant headache complaint. S was a 14-yr-old girl who presented the complaints over a 9 mo. period. Since other consequential means to control this behavior were difficult to employ, the present procedure requested S to write down conditions related to the headache complaints. The effectiveness of the procedure was evaluated by dual assessment method. Data show that her complaints were eliminated within 8 wk.—*Journal abstract*.

5091. Zupnick, Stanley M. (Medical Coll. of Ohio, Toledo) The effects of varying degrees of a peer-model's performance on the extinction of a phobic response in an individual or group setting. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 433-434.—When in group settings, extinction of a phobic response (snake-handling) varied according to increasing peer-model "performance." Ss attended to the model's behavior and thus handled the snake because of their sensitivity to the effects of "group evaluation," and the implicit promise of receiving social reinforcement. Furthermore, 3 sessions with the phobic object helped "desensitize" their fear via a cognitive rehearsal-desensitization process. This phenomenon also accounted for the occurrence of extinction in individual settings even though the relationship between model performance and degree of handling in these sessions was not obtained.—*Author abstract*.

Special & Adjunctive Therapy

5092. Oystagrh, Philip. (1 Jacques Ave., Bondi Beach, New South Wales, Australia) The use of hypnosis in general and obstetric practice. *Medical Journal of Australia*, 1970(Oct), Vol. 2(16), 731-733.—Discusses the varied uses of hypnosis in general and obstetric practice, gives a brief history of hypnosis, and describes the technique used. A series of cases is presented to demonstrate different effects in the use of hypnosis.—*Journal abstract*.

5093. Todd, Frederick J. & Kelly, Robert J. (U. Colorado, Medical Center, Denver) The use of hypnosis to facilitate conditioned relaxation responses: A report of three cases. *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 295-298.—Describes the treatment of 3 32-49 yr. old women in which hypnotic procedure was used to facilitate the substitution of relaxation for tension responses which had led to headaches, drug taking, and insomnia. The procedure provides conditions for vivid rehearsal along with strong suggestion for the initiation of the new response pattern.—*Journal abstract*.

Drug Therapy

5094. Bueri-Atem, Salomon; Brahim, Domingo, & Curl, Jose O. (U. Cuyo, Mendoza, Argentina) Oxazepam in allergic conditions. *Psychosomatics*, 1971(Jan), Vol. 12(1), 46-48.—Administered oxazepam at 3 dosage levels, (adult, older children, and children under 12), to 49 1-64 yr. old patients with allergies

accompanied by strong emotional components. Other medications were administered as required. Complete remission of all allergic symptoms (including asthma, skin lesions, bronchitis, rhinitis, and conjunctivitis) was obtained in 24 Ss. A satisfactory response (both allergic and emotional) was obtained in 36 Ss. Improvement was unrelated to sex or age. Oxazepam sometimes produced drowsiness in adults. The value of oxazepam in relieving anxiety which may accompany an allergy is discussed. (19 ref.)—*Journal summary*.

5095. Brodsky, Carroll M. (U. California Medical School, San Francisco) Diagnostic concepts based on treatment. *Psychosomatics*, 1971(Jan), Vol. 12(1), 30-35.—Reports experiences with patients being treated with psychotropic drugs. While results of psychoactive drug treatment are unpredictable, in the case of certain types of patients, results can be predicted. 10 brief case histories of various types of manic, schizophrenic, and depressive patients are included, and their reactions to the drugs used in their treatment are described. Problems involved in predicting outcomes of drug treatment are discussed. It is suggested that more up-to-date diagnostic concepts can evolve from an examination of patient-drug reactions.—A. Goldstein

5096. Carroll, B. J. & Davies, Brian. (U. Melbourne, Australia) Clinical associations of 11-hydroxycorticosteroid suppression and non-suppression in severe depressive illnesses. *British Medical Journal*, 1970(Mar), Vol. 1(5699), 789-791.—Separated 50 patients with severe depression into 2 groups by the responses of their plasma 11-hydroxycorticosteroid levels to a midnight dose of 2 mg. of dexamethasone. Clinical and questionnaire comparisons were made between the 2 groups, who were similar in regard to age, sex, and length of symptoms before admission to hospital. No differences were found between the groups in the severity of their depression and anxiety assessed by questionnaire. Nevertheless, agitation was significantly greater in Ss whose cortico-steroid levels were not suppressed by dexamethasone and adverse childhood experiences in those whose levels were suppressed.—*Journal abstract*.

5097. Conners, C. Keith, et al. (Massachusetts General Hosp., Child Development Lab., Boston) Treatment of young delinquent boys with diphenylhydantoin sodium and methylphenidate: A controlled comparison. *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 156-160.—Assigned 43 9-14 yr. old delinquent boys to double-blind treatment with diphenylhydantoin sodium, methylphenidate, or placebo for 2 wk. Ratings of symptoms by cottage parents and teachers, a measure of frustration, the Pontius Maze Test, and an interview were used to assess the effects of the treatments. None of the measures showed effects attributable to the drugs, and subjective reports tended to show negative effects of the active drugs. The danger of random assignment studies was demonstrated, however, by the fact that the more disturbed Ss were assigned by chance to the placebo group. The lack of acute symptomatology, the short period of treatment, and the heterogeneous nature of the sample were considered as possible explanations of the apparent lack of beneficial effects of the 2 drugs. (15 ref.)—*Journal abstract*.

5098. Crane, George F. & Naranjo, Evelyn R. (Spring Grove State Hosp., Catonsville, Md.) Motor disorders induced by neuroleptics: A proposed new classification. *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 179-184.—Proposes a comprehensive classification

tion of motor disorders attributed to neuroleptic drugs. Some manifestations resemble those occurring in known diseases of the CNS; other abnormalities are typical effects of drugs with neuroleptic action. A factor analysis on the most frequently occurring motor disorders in 97 Ss generated the following symptom clusters: (a) tremor, bradykinesia, rigidity, and attendant symptoms; (b) buccolingual-masticatory dyskinesia, astasia, dyskinesia of the lower extremities and posture in extension; and (c) dyskinesia of the upper extremities and postural disorder. The classification and the factors were used to study the effects of drug withdrawal in 22 Ss over a 10-mo period. Symptoms of cluster 1 decreased while those of cluster 2 increased in severity. In 17 controls receiving standard drugs during a comparable period, no significant changes were noted. (16 ref.)—*Journal abstract*.

5099. Danielczyk, W. Folgen einer Disulfiram-Psychose. [Effects of a disulfiram psychosis.] *Nervenarzt*, 1969(Apr), Vol. 40(4), 188-191.—Describes the case of a 33-yr-old government clerk who killed his wife and children and tried to commit suicide. He had been an alcoholic for several yr. and finally agreed to undergo treatment which was successful. He was given 2 antabuse tablets/day. There is evidence that antabuse (disulfiram) can cause a toxic psychosis with impaired consciousness, amnesia, hallucinations, and delusions. 3 mo. after treatment began, S entered a typical state of pseudo-neurasthenia but did not consult his doctor. 2 wk. later, dizziness and nausea increased, and under a delusion he committed the murders and attempted suicide. There was no psychological explanation for the crime, and it was decided that at the time of the murders he was suffering from a disulfiram psychosis and therefore could not be held responsible. He had no history of violence. In the 1st few days after the murders the S was able to explain them. After a week, however, and several operations to save his life, partial amnesia set in and erased the memory of his act. The S was no longer able to identify with the murderer but felt responsible for the consequences.—B. Schay.

5100. Dynes, John B. (Veterans Administration Hosp., Salem, Va.) Oral dyskinesias: Occurrence and treatment. *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 854-859.—Reports a clinical study to determine (a) "the frequency of the drug induced Parkinson-like syndrome and particularly the occurrence of the oral dyskinesias," (b) the type of patient most likely to be affected, and (c) "the value of certain anti-Parkinson drugs in the treatment of patients with severe drug induced oral dyskinesias." Ss were 22 45-81 yr. old patients who showed the most severe and persistent symptoms of oral dyskinesia out of a total population of 1400 patients in a veterans' hospital. 12 carried a primary diagnosis of chronic brain syndrome and 10 a diagnosis of schizophrenia. Results indicate that Ss were not helped appreciably by artane (trihex-phenidyl), cogentin (benztropine), symmetrel (amantadine), or pyridoxine. It is suggested that caution be exercised in the prescribing of phenothiazines for the elderly brain damaged patient. A case report is included. (28 ref.)—P. McMillan.

5101. Echegaray Villagarcía, Jaime. Consideraciones sobre la angustia y su tratamiento farmacológico. [Considerations on anxiety and its pharmacological treatment.] *Revista Mexicana de Psicología*, 1970(Sep), Vol. 4(3), 144-148.—Within the context of Freud's

theory of anxiety, the differences between neurotic and normal anxiety, along with the pathological aspect of their symptoms, and the sources of anxiety (e.g., frustration and fear of nonbeing) are examined. Physio-dynamic (physiodynamic) and psychodynamic (endodynamic) anxiety are distinguished from each other and drugs are especially suggested as a method of treatment for the former (along with psychotherapy) while psychotherapy is recommended for the latter. In stressing the importance of the doctor-patient relationship, it is proposed that pharmacological treatment not only be limited to the symptomatic aspect of anxiety, whereby drugs are considered as pure sedatives, but also be applied to the physiodynamic elements that are the basis of anxiety.—D. H. Schuster.

5102. Giménez Roldán, S. & Campos Castelló, J. (State Great Hosp., Madrid, Spain) Propericiazina y trastornos de la conducta en enfermedades neurológicas de la infancia y adolescencia. [Propericiazine and behavior disturbances in neurologic illnesses of childhood and adolescence.] *Archivos de Neurobiología*, 1969(Jul), Vol. 32(3), 331-346.—Studied the effects of propericiazine on behavior disorders of 152 children. They were divided into 4 groups: (a) Ss where neurologic investigation did not show serious disturbances independent of IQ and EEG abnormalities; (b) Ss with cerebral palsy, which comprised the largest group; (c) Ss with epilepsy; and (d) a heterogeneous group of Ss with organic illnesses of the nervous system. The most frequent problems of conduct were hyperactivity and irritability. They were given an EEG as well as Raven's Progressive Matrices, the Stanford Binet Intelligence Scale, and the Goodenough Intelligence Test. It is concluded that propericiazine is the treatment of choice on behavioral disorders of neurologic Ss, since 32% of excellent and 32% of good results were obtained from this study. (English & French summaries) (34 ref.)—A. M. Farfaglia.

5103. Grozier, Michael L. (Squibb Inst. for Medical Research, New Brunswick, N.J.) Why a long-acting neuroleptic? Fluphenazine decanoate: Brief review and clinical rationale. *Psychosomatics*, 1971(Jan), Vol. 12(1), 56-60.—Most former hospitalized schizophrenic patients who discontinue medication require rehospitalization. A method for insuring that such a patient receives an adequate and continual dose of antipsychotic medication without exposure to the hazards of long-term therapy with high doses of a major tranquilizer is the use of a long-acting injectable neuroleptic, e.g., fluphenazine decanoate. A study is described in which 501 chronically ill psychotic patients were given fluphenazine decanoate. 308 Ss (61%) demonstrated a satisfactory clinical response. These results are impressive in light of Ss' long duration of illness and previous unsuccessful drug therapy. Fluphenazine decanoate has a mean duration of effect of approximately 4 wk. Most of the adverse effects are self-limiting, and treatment has not produced any of the toxicity associated with the chronic administration of other antipsychotic drugs. (29 ref.)—A. Goldstein.

5104. Hollister, Leo E., Overall, John E., Pokorny, Alex D., & Shelton, Jack. (Veterans Administration Hosp., Palo Alto, Calif.) Acetophenazine and diazepam in anxious depressions. *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 273-278.—Classified 67 newly admitted depressed patients on the basis of their presenting signs and symptoms as having the syndrome of anxious depression. Ss were assigned

randomly either to treatment with the phenothiazine derivative, acetophenazine, or with the antianxiety drug, diazepam. After 4 wk. of treatment, both groups were equally improved. Study of the interactions between drugs and demographic variables revealed that Ss with less long-term and uncomplicated depressions responded better to diazepam, the converse being true for acetophenazine. It is suggested that since most patients fall into the group which responds best to them, as well as because of their greater safety, drugs such as diazepam might be the 1st choice of treatment for anxious depression. (18 ref.)—*Journal abstract.*

5105. Jarvik, Lissy F., et al. (New York State Psychiatric Inst., New York) **Chromosome examinations in patients on lithium carbonate.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 166-168. —Examined the report of chromosome damage in Ss on lithium carbonate. Peripheral blood cultures were set up from 16 manic-depressive Ss who had taken lithium carbonate for periods of 2 wk. to over 2 yr. (7 Ss for 1 yr. or more), from 4 manic-depressive Ss on placebo, and from 10 control Ss. Even though the highest average frequency of breaks occurred in the lithium carbonate group (3.3%), the value corresponded to the means (1.9-4.3%) generally observed in the laboratory and the difference between the lithium carbonate group and the controls (1.5% breaks) did not reach statistical significance.—*Journal abstract.*

5106. Klett, C. James; Hollister, Leo E., Caffey, Eugene M., & Kaim, Samuel C. (Veterans Administration Hosp., Perry Point, Md.) **Evaluating changes in symptoms during acute alcohol withdrawal.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 174-178. —Assigned 428 male patients experiencing the symptoms of acute alcohol withdrawal at random to double-blind treatment with chlordiazepoxide, chlorpromazine, hydroxyzine, thiamine, or placebo for a 10-day period. Ss were rated 3 times daily by nursing personnel using a Nurses' Rating Scale and were asked to complete a Mood Scale daily. Ss generally showed a rapid improvement in different symptom areas regardless of the group to which they had been assigned. Treatment comparisons suggested that fewer symptoms were associated with placebo and thiamine treatment than with the 3 psychoactive drugs. It is concluded that the greater incidence of convulsions and delirium occurring in these 2 groups as compared with the chlordiazepoxide group more than offset any advantage that may exist for what is essentially supportive treatment.—*Journal abstract.*

5107. Kupfer, David J., Wyatt, Richard J., Synder, Frederick, & Davis, John M. (Yale U., Medical School) **Chlorpromazine and sleep in psychiatric patients.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 185-189. —Investigated the effect of chlorpromazine on Ss with sleep disturbance. Results with 5 Ss showed that chlorpromazine given at bedtime coincided with a marked increase in actual sleep time as exemplified by a significant decrease in intermittent wakefulness. Total REM time was increased proportionately to the increase in actual sleep. In a more extensive study with 4 Ss, it was found that the administration of daytime chlorpromazine (100 mg) had no direct effect on sleep as compared to placebo. In contrast, bedtime chlorpromazine was associated with significant changes in various sleep parameters. That the time course of chlorpromazine administration is responsible for the

differential effect on sleep is supported by the preliminary investigation with plasma chlorpromazine levels (19 ref.) *Journal abstract.*

5108. Litvak, Ronald & Kaelbling, Rudolf. (Ohio State U., Medical School) **Agranulocytosis, leukopenia, and psychotropic drugs.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 265-267. —Questions the usefulness of a routine white blood cell count (WBC) in detecting a developing agranulocytosis. Routine WBCs may foster a false sense of security and lead a physician to discount other symptoms; on the other hand, not every WBC below 3700/cubic mm is cause for abandoning a helpful drug. It is suggested that the medical staff should be on the alert for evidence of infection in patients taking psychotropic drugs so that laboratory tests can be ordered if indicated by current symptoms or a history suggesting a high risk. 3 case histories are presented from a study of 84 Ss with low WBCs.—*Journal abstract.*

5109. Marshall, Myron H. (Silver Hill Foundation, New Canaan, Conn.) **The psychopharmacology of depression: Perspectives in research.** *Psychosomatics*, 1971(Jan), Vol. 12(1), 49-55. —Administered the antidepressant drug, desipramine (norpramin) to 91 19-72 yr. old outpatients with psychotic or neurotic depressive reactions. Results were analyzed in regard to the apparent degree of efficacy of the drug in relieving depression, improving sleep quality, and as to side effect liability. In general, norpramin was found to be efficacious to the degree found in other studies. Contrary to previous observations, norpramin seemed more effective in neurotic than psychotic depressions. There was a clear parallel improvement in sleep when depression improved. No serious adverse effects occurred.—*Journal summary.*

5110. McConahey, O. Linda & Thompson, I. **Concurrent behavior modification and chlorpromazine therapy in a population of institutionalized mentally retarded women.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 761-762. —Compared the relative efficacy of chlorpromazine and behavior modification therapy in altering the behavior of 26 severely retarded women. Ss were randomly assigned to drug or placebo groups, and treatments were alternated every 28 days for a total of 112 days. During mornings, reinforcement contingencies were in effect; during afternoons, no contingencies were in effect. 50 objective behavioral measures were used both morning and afternoon. There was no overall drug effect across patients on any or all behavioral measures. There were large and statistically significant differences in several behavioral measures between periods when adaptive behavior was reinforced and when it was not. There were statistically significant improvements on all 3 behavior rating scales comparing pre- and posttest scores.—*Author abstract.*

5111. McDaniel, Thomas W. (Arkansas State Hosp., Little Rock) **Comparative therapeutic efficacy of spansule form of phenothiazine and phenothiazine tablets.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 839-843. —65 chronically ill patients, primarily psychotic, received maintenance treatment with thioridazine (average, 260 mg day given in tablet form twice-day for 60 days). All Ss had been treated previously with the same twice-daily dosages of chlorpromazine in sustained-release capsules. Global ratings of response to thioridazine indicate that for the 69% of Ss

this drug had provided at least equivalent therapeutic effect, in comparison to responses recorded earlier upon chlorpromazine medication. 29% of the Ss showed an overall improvement on thioridazine. Ratings of target symptoms and behavioral characteristics reflect these improvements, e.g., anxiety-tension and depressive mood were often alleviated and Ss' attitude-emotional stability and cooperativeness were improved. These results, along with follow-up data recorded for continued twice-daily treatment with thioridazine in regular tablet form, strongly suggest that sustained-release phenothiazine preparations offer no advantages over customary oral tablet preparations and also demonstrate that thioridazine is eminently useful in maintaining chronic psychotic patients.—*Journal summary*.

5112. Noto, R., Robert, J., & Hanote, P. (55 Blvd. de Port-Royal, Paris, France) **Traitement d'urgence et transport des intoxications aiguës par les dérivés imipraminiques: A propos de 70 cas.** [Emergency treatment and transportation of cases of acute imipramine derivative poisoning: Apropos of 70 cases.] *Agressologie*, 1970, Vol. 11(6), 515-521.—Studied the problems raised by the emergency intensive care before admission required by Ss poisoned by imipramine derivatives in 70 cases. The problems common to all drug poisoning are: the preliminary examination before transfer of the patients to evaluate any possible immediate or long-range risk; early, on-the-spot treatment of eventual cardiorespiratory distress; medical control during transfer; and choice of adequate hospital facilities, depending on the state of the patient. The specific problems raised by this type of poisoning are: the intraventricular conduction disorders requiring early treatment with sodium lactate, no matter whether these disorders do or do not cause cardiovascular collapse; electrocardiographic control and systematic venous pressure determination, both to appreciate the risk and orient treatment; the risk of convulsions which appears very rapidly must not be overlooked; the frequency of drug combination with barbiturates, neuroleptics, and sedatives, which increases the risk of alteration of consciousness and cardiorespiratory distress. Very strict care, permanent control during transportation, and an adequate choice of hospital facilities should be able to greatly improve further the prognosis of this type of poisoning. (Russian, German, & Spanish summaries)—*English summary*.

5113. Pancheri, Paolo. (U. Rome, Inst. of Psychiatry, Italy) **Obiettivazione dati e programmazione della ricerca in psicofarmacologia clinica** [Objectification of data and programming of research in clinical psychopharmacology.] *Rivista di Psichiatria*, 1970(May), Vol. 5(3), 249-275.—The most important methodological topics in the field of psychopharmacological research are analyzed and criticized: quantification, variability, formulating a hypothesis, dosage, diagnosis, etc. (English summary) (31 ref.)—*N. De Palma*.

5114. Porter, A. M. **Depressive illness in a general practice: A demographic study and a controlled trial of imipramine.** *British Medical Journal*, 1970(Mar), Vol. 1(5699), 773-778.—Reports that the distribution of 93 consecutive cases of depressive illness in a general practice was nonrandom. Married women were at risk, while men and unmarried women were largely spared. Married women were prone to the disorder at any time in their lives, and relapse was frequent. There was some suggestion that divorced wives and wives of low social

class were particularly predisposed to the disorder. 60 of the patients took part in a double-blind controlled trial of imipramine. There was no evidence that the drug was superior to a placebo in inducing a remission. It is suggested that imipramine has become established in clinical practice on inadequate evidence and that there is a need for further trials. (71 ref.)—*Journal abstract*.

5115. Tupin, Joe P. (U. California, Davis) **The use of lithium for manic-depressive psychoses.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 73-80.—Discusses lithium, "the indications and contraindications for its use, the method of administration, its side-effects and toxicity, and its mode of action." The prophylactic properties of lithium in the treatment of mania and manic depressive behavior disturbances and on the role lithium may play in studies of the biochemical aspects of behavior are emphasized. (79 ref.)—*S. Knapp*.

5116. Wyatt, Richard J., Fram, David H., Kupfer, David J., & Snyder, Frederick. (National Inst. of Mental Health, Lab. of Clinical Psychopharmacology, Bethesda, Md.) **Total prolonged drug-induced REM sleep suppression in anxious-depressed patients.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 145-155.—Administered the MAOI inhibitor (I) phenelzine to 6 anxious-depressed patients while daily behavioral and EEG sleep records were made. REM sleep was completely suppressed for 14-40 nights. Upon discontinuation of MAOI REM sleep increased as much as 250% above normal levels. The bipolar EEG changes were paralleled by similar changes in depression and anxiety. The behavior of all Ss markedly improved at times when REM sleep was completely absent. 2 of the 4 Ss studied after MAOI discontinuation became profoundly anxious with REM compensation. The morning recall of dreams also closely paralleled the presence or absence of REM sleep. Evidence indicates that suppression of REM sleep might help to alleviate depression. (64 ref.)—*Journal abstract*.

HOSPITAL CARE & INSTITUTIONALIZATION

5117. Beahan, Laurence T. (Edward J. Meyer Memorial Hosp., Buffalo, N.Y.) **Emergency mental health services in a general hospital.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 81-84.

5118. Brooks, Dean K. (Oregon State Hosp., Salem) **A bushel of shoes.** *Hospital & Community Psychiatry*, 1969(Dec), Vol. 20(12), 371-375.—Reports the activities of a task force made up of patients, staff, and community members in examining and recommending changes in the elements of physical care in a mental health hospital. The purpose of the task force was to identify and alleviate situations which resulted in patient dehumanization. Studies on toilet paper, clothing, laundry, patient's money, and possessions, as well as eating, and sleeping schedules were examined. Investigations in progress are outlined.—*S. Knapp*.

5119. Falck, Hans S. (U. Maryland, Baltimore) **Individualism and the psychiatric hospital system** *The problem of professional autonomy.* *Bulletin of the Menninger Clinic*, 1971(Jan), Vol. 35(1), 19-27.—"American individualism has serious flaws and is incompatible with an industrial welfare state.... Tradition in psychiatric treatment in nearly all its forms emphasizes individualism of both patient and therapist. Recent interest in group work, family treatment, and community

psychiatry severely challenges it. Thus, ideologically, the extension and elaboration of such methods turns out to be something more than the addition of a few treatment techniques.... The professions must give up their preoccupation with 18th century notions of individualism and with their 20th century counterpart, technical overspecialization. What we need are programs stressing the psychosocial nature of man, placing man in his proper context. We must educate staff who can work next to or above or below each other. Yet we require a point of view that stresses an integrated individuality, with an emphasis on groups and the sharing of responsibilities."—J. Z. Elias.

5120. Forness, Steven; Esveldt, Karen, & Jacobs, Nora. (U. California, Los Angeles) **Classroom exclusion in a children's psychiatric hospital. Exceptional Children**, 1971(Feb), Vol. 37(6), 463-464. —Describes the use of a classroom management technique in which children with disruptive behavior were systematically excluded from the classroom and returned to a psychiatric hospital ward. An 8-wk check list on all exclusions showed that the technique was effective and promoted classroom cooperation. Teacher ratings showed that improved behavior was evident in 89% of the Ss who returned to the classroom.—P. Hertzberg.

5121. Hansell, Norris & Benson, Marvin L. (Harvard Medical School, Boston, Mass.) **Interrupting long-term patienthood: A cohort study. Archives of General Psychiatry**, 1971(Mar), Vol. 24(3), 238-243. —Describes the highly organized day and social system of a program for returning previously desocialized patients from mental hospitals to productive citizenship. 36% of a cohort of 66 patients, with an average 14-yr previous hospitalization, had been converted to outside, independent lives at an 18-mo follow-up. The patient group selected had an age and physical health status compatible with active employment so that the job-skill aspect of the program would be meaningful. Patients become interested in the nonhospital world as a result of a highly demanding, challenging culture and conventional, non-patienthood expectations created within the program.

Journal abstract.

5122. Harper, J. R. & Varakis, G. (Northampton General Hosp., England) **Children in adult intensive therapy units. British Medical Journal**, 1970(Mar), Vol. 1(5699), 810-813. —From experience in the Northampton/Kettering area, 9-10% of all patients in a general hospital requiring care in an intensive therapy unit were aged 12 yr. or under. 59 children were admitted to an intensive therapy unit over a 2-yr period. Of these, 22 had been injured in road traffic accidents, 5 were surgical emergencies, 5 had meningitis, 4 status epilepticus, and 4 respiratory infections. All of the 30 families interviewed were in favor of their child being admitted to the unit, and none considered that the experience had had any lasting adverse psychological effect on the child. It is suggested that certain carefully selected child patients do benefit from the facilities of an intensive therapy unit, and for this reason such units must be designed, equipped, and staffed with this in mind.—*Journal abstract.*

5123. Korman, Maurice & Giller, Donald W. (U. Texas, Southwestern Medical School, Dallas) **Psychosocial factors in early release from psychiatric hospitalization. Psychological Reports**, 1971(Feb), Vol. 28(1), 251-257. —Collected extensive demographic and psychometric information on 402 consecutively admitted

psychiatric patients. Those male Ss who were discharged with medical advice in 75 days or less tended to show less severe pathology on admission together with a history of some stability and interpersonal success, yet saw themselves as troubled in a number of areas and in need of help. While a more favorable diagnosis was equally predictive of early release in females, measures reflecting the significance of marriage and family were featured prominently. Males and females differed markedly, however, regarding the relationship of presenting symptoms (as derived by the Cornell Index) to early release from hospitalization.—*Journal abstract.*

5124. Kretz, Helmut. (U. Heidelberg, Psychiatric & Neurological Clinic W. Germany) **Sozialpsychiatrische Einrichtungen mit oder ohne Trennung der Geschlechter? Probleme und Erfahrungen bei der Einrichtung einer für Männer und Frauen gemeinsamen Bettenstation. [Psychiatric facilities with or without separation of the sexes? Problems and experiences in the establishing of an integrated male-female ward.] Nervenzentr.** 1969(Apr), Vol. 40(4), 176-183. —Discusses the belief that the separation of male and female patients, especially schizophrenics, increases their pathological behavior. An experiment was conducted, based on a theory by Reil and Nossitz 150 yr. ago, that stated that the vital libidinous energies could be used in the healing process. A psychiatric ward for 11 males and 11 females, mostly single and 18-35 yr. old, was integrated 1 1/2 yr. ago. Only bedrooms remained separate. In all other respects the patients lived together, and contacts between males and females were encouraged. Therapy included dancing classes and drama. For the 1st time, female nurses attended to male patients and vice versa. This social training forced the patients to identify with their sexual roles. Occasional incest, due to close contact between male and female patients, was always temporary. Fears that integrated facilities would lead to sexual relations did not materialize due to the patients' own insecurity about their sexual roles. A sexually integrated ward can be successful because it facilitates therapy, humanizes the hospital situation, and reproduces the same conditions that face the patient in the outside world. (S. G. L.) *B. Schatz.*

5125. Lehrer, Paul; Schiff, Lawrence, & Kris, Anton. (Rutgers State U., Psychology, Camden) **The use of a credit card in a token economy. Journal of Applied Behavior Analysis**, 1970(Winter), Vol. 3(4), 389-391.

5126. Lorei, Theodore W. & Cohen, Jacob. (Veterans Administration Hosp. Washington, D.C.) **A comparison of two methods of value measurement. American Journal of Psychology**, 1971(Mar), Vol. 84(1), 23-24. —Category rating and ratio estimation were used by 621 hospital staff respondents to scale the importance (value) of 16 possible outcomes of releasing psychiatric patients or keeping them in the hospital. Stevens et al. find that the relationship between the 2 methods is intermediate between linear and logarithmic was confirmed for 7 of the 8 occupational groups, but not for psychologists. The 2 methods yielded essentially identical answers to the substantive survey questions.

Journal abstract.

5127. Mishara, Brian L. (Northville State Hosp., Mich.) **Effects of a rehabilitation program for chronic elderly "mental" patients: Changes in care needed. Proceedings of the Annual Convention of the American Psychological Association**, 1971, Vol. 64(Pt. 2), 645-646. —Reports a rehabilitation program for long-term

elderly mental hospital patients. Staff training preceded introduction of increased environmental enrichments (e.g., food snacks, ward decoration, planned activities). Decreases in frequency of incontinence, amount of care given for personal hygiene and dress, and numbers of bizarre behaviors were found significant. Results indicate that rehabilitation programs with older, seemingly "hopeless," individuals may prove beneficial by allowing a shift in staff time from physical care to interpersonal interaction, besides improving individual patients' daily behavior. Changes in incontinence may indicate a significant psychological component to this behavior.—*Author abstract.*

5128. Nelson, Constance B. (Veterans Administration Mental Hygiene Clinic, Denver, Colo.) **College students help chronic patients.** *Hospital & Community Psychiatry*, 1969(Dec), Vol. 20(12), 394-395.—Describes a program using volunteer undergraduate psychology students in direct association with patients. 42 male and 6 female students took part in the project in the 1st yr. Students were matched with patients on the basis of similar interests. Students gained valuable experience and were considered a valuable addition to the hospital.—*S. Knapp.*

5129. Schwartz, Arthur N. (Veterans Administration Center Domiciliary, Los Angeles, Calif.) **Volunteers help build patients' self-esteem.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 87-89.—Reports a project in which attractive young women volunteers were recruited to attend group gatherings of institutionalized males in order to provide a safe social situation in which the patients might build self-esteem and social skills.

5130. Steinmetz, Donald K. (Southern Illinois U.) **The use of modeling and reinforcement to increase task orientation with state hospital patients.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3356-3357.

5131. Willard, Charles. (Athens Mental Health Center, O.) **Psychiatric aides as case managers.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 93.—Describes the development of a program using ward aides as case managers in the psychiatric team of an acute intensive treatment unit. It is concluded that a stable personnel force and professional staff members who are receptive to the statements of the case managers are essential to the success of such a program.—*S. Knapp.*

PSYCHOANALYTIC INTERPRETATION

5132. Rank, Otto. **The double: A psychoanalytic study.** Trans. H. Tucker. Chapel Hill, N.C.: U. North Carolina Press, 1971. xxii, 88 p. \$5(cloth).

5133. Riemann, Fritz. (8 München 81, Oberfohringer Str. 27, W. Germany) **Über den Vorteil des Konzeptes einer präoralen Phase.** [Advantages of a pre-oral phase concept.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Jan), Vol. 16(1), 27-40.—The oral phase is considered to be the earliest phase in the child's development. However, the 1st few weeks of life, preceding the development of emotional ties, can be viewed as a separate preoral or sensory phase. The concept of such a preoral phase would have the following advantages: (a) Impressions of the 1st 8-12 wk. of life would be placed on the same level of importance as the oral, anal, and phallic, and thus provide

schizoidism with a clue to its specific phases as in the case of other neuroses. (b) The assumption that the oral phase succeeds an earlier phase of a different kind makes it understandable that there are regressive processes from the oral to the sensory. And (c) the possibility of obtaining access to impressions in the earliest phase through the sensorium as the principle organ and through projection as the principal function, means an increased understanding of schizoid and psychotic phenomena. Herein lie, at the same time, diagnostic as well as therapeutic aids which are merely suggested here. A better understanding of schizoid phenomena can be obtained through this concept and is thus of great help in the treatment of schizoid patients.—*B. Schay.*

5134. Shapiro, David. **Motivation and action in psychoanalytic psychiatry.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 329-343.—Distinguishes between motivational psychology and the psychology of action. The emphasis of psychoanalytic theory on the need-driven concept of action and on the objective-scientific viewpoint is described as inadequate. A volitional conception of action is proposed for an explanation of the subjective experience of volition and for an understanding of certain objective features of action. Action is discussed as self-directed activity when it is determined by integrative processes which supersede the pressure of needs as the directing agency. Compared to needs, conscious motives are influenceable and oriented to instrumentalities. Only a theory of action which allows for such conscious motives can explain the experiences of indecision and temptation. In therapy the concepts of "impulses" and unconsciously motivated actions assume actual quantities of some sort of energy and the "circumvention of those volitional processes which give action its most ordinary, recognizable qualities." It is concluded that the need-driven concept of action which predominates in theory and therapy leads to a preoccupation with motivational forces and ignores the individual's conceptions of his own acts.—*S. Knapp.*

PSYCHODIAGNOSIS

5135. Braun, Jean S. & Brane, Maria. (Lafayette Clinic, Detroit, Mich.) **Comparison of the performance of children with dysrhythmia Grade I and normal EEG on psychological tests.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 457-458.—Many children's clinics and hospitals make standard use of the EEG as part of the evaluation of children with psychiatric symptoms. Abnormal EEGs have been found to correlate with abnormal psychological test functioning. However, a frequent EEG finding is "dysrhythmia Grade I." The present study was designed to determine whether some differences could be discovered between children with Grade I dysrhythmia and children with no children with Grade I dysrhythmia on specific psychological tests. The 2 such EEG finding on specific psychological tests. The 2 groups did not differ significantly on most of the tests. Final diagnoses of these children indicated that Grade I dysrhythmia on the EEG was not differentiating.—*Author abstract.*

5136. Downes, B. **Assessment Centre: Gladesville Hospital.** *Australian Occupational Therapy Journal*, 1970(Apr), Vol. 17(2), 15-17.—Describes the organization and development of an assessment center to (a) derive information concerning a psychiatric patient's

social, psychological, and occupational potential for rehabilitation; and (b) provide rehabilitation programs in line with the patient's potential. Industrial, electrical, and clerical tests were developed from a programed learning course and predetermined time and motion coding of industrial-type tasks (MODAPTS). Social data are obtained from the patient's past educational and employment history. Motivation tests are described. Psychological assessment involves ratings of ward behavior and symptoms. Other tests in development are briefly noted. The content of the final assessment report is outlined, and assessment charts are presented in an appendix.—S. Knapp.

5137. Gill, H. S. (Tavistock Clinic, London, England) **A comparison of test findings with psychiatric assessment.** *British Journal of Projective Psychology & Personality Study*, 1969(Dec), Vol. 14(2), 2-10.—Detailed personality descriptions, based on responses to the Tavistock Clinic word association test, were matched with clinical reports for 20 patients. The clinical reports were written by attending psychiatrists. 3 psychologists matched the 2 groups of evaluations, and for 2 of them the matching was correct for all 20 pairs. The 3rd one matched 15 pairs correctly. The technique is illustrated through the presentation of the full data for 1 patient.—B. Beit-Hallahmi.

5138. Gough, Harrison. (U. California, Berkeley) **Some reflections on the meaning of psychodiagnosis.** *American Psychologist*, 1971(Feb), Vol. 26(2), 160-167.—Although psychodiagnosis is rejected by many psychologists, a rational case can be made for its preservation. Diagnosis may be viewed as a special instance of the general logical problem of causation. The history and systematics of diagnosis suggest that its practice requires special aptitudes including the ability to think inductively. There are levels of diagnosis, proceeding from symptom to pathology to etiology. Psychological aids to diagnosis, such as tests, are of greatest value when addressed to the 2nd and 3rd levels—those of pathology and etiological context. Automated and computerized programs of diagnosis and interpretation can help clarify the infrastructure of a diagnostic problem, but by themselves cannot maintain the tradition of diagnostic thinking to which psychology can and should contribute. (27 ref.)—Author abstract.

5139. Heldt, Thomas J. (Henry Ford Hosp., Div. of Neuropsychiatry, Detroit, Mich.) **Positive psychiatric diagnosis versus psychiatric diagnosis by exclusion.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 851-853.—Presents the view that signs and symptoms of psychiatric disorders "can be positively recognized as certainly as can those of somatic illness." Exception is taken to the idea that a psychiatric diagnosis is only arrived at if there is no apparent organic cause. An aspect of establishing a psychiatric diagnosis is the disproportionate degree of the symptoms present. 5 illustrative case histories are presented.—P. McMillan.

5140. Jones, G. E. (Shenley Hosp., St. Albans, England) **Freedom, constraint and change in the assessment interview.** *British Journal of Projective Psychology & Personality Study*, 1969(Dec), Vol. 14(2), 23-30.—The dynamic structure of the assessment interview is understood in terms of a changing configuration of freedoms and constraints. Implications of this view for the process of assessment and the projective hypotheses are examined. The nature of the stimulus situation and

the process of clinical inference are analyzed. The "projective hypothesis" is redefined in terms of the individual's reaction to the dynamic structure of a stimulus situation.—B. Beit-Hallahmi.

5141. Mecke, Viola. (Children's Health Council, Palo Alto, Calif.) **Centration: A perceptual process diacritic of intellection and a differential diagnostic criterion.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 827-834.—Reports a pilot study to determine whether centration, as a perceptual process, could be a criterion for differentiating between neurologically impaired and emotionally disturbed children. Centration was defined by Piaget as a prolonged involuntary attachment of a sensory modality to 1 part of a visual field that, in turn, affects motor behavior, producing effects on drawing tasks by a separation of designs or their parts coincident with distortions. Neurologically impaired Ss were seen as having basic difficulties with perception whereas emotionally disturbed Ss would have basic difficulties in intellection. Therefore, the centration-distortion error would characterize drawings of the neurologically impaired but not of the emotionally disturbed Ss. A sample of 12 7-10 yr. old Ss for each group was selected, with EEG records, psychological tests, and psychiatric interviews being used as defining criteria. The hypothesis was upheld for each S in the neurologically impaired group making at least 3 out of a possible 4 errors. Only 1 S in the emotionally disturbed group made a centration-distortion error. (23 ref.)—Journal abstract.

5142. Mèrel, Ferenc. **A Lüscher-próba a klinikai pszichodiagnosztikában.** [The Lüscher Test in clinical psychodiagnostics.] *Pszichológiai Tanulmányok*, 1968, No. 11, 711-730.—Lüscher records of 100 neurotics, 85 schizophrenics, 72 psychopaths, 117 mental defectives, and a normal control group of 216 adults and 100 children were processed. Ss were stratified on the basis of intelligence into homogeneous groups of "very good" and "good average" (using the Wechsler IQs), and into favorable and unfavorable groups (classified by means of sociograms). Loadings with adrenalin and noradrenalin were employed. On the basis of significant indices and interpretation of trend differences, the following psychodiagnostic directives were obtained: (a) anxiety based on the agreement of data in Ss with adrenalin loading and anxiety neurosis Ss, (b) alienation based on agreement of data in Ss with peripheral social situation, and schizoid and antisocial Ss, (c) acting out personality, based on data in suicidal Ss, Ss with peripheral social situations, and on data in certain types of social Ss, (d) regulation-deprivation tension, and (e) elaboration. (Russian summary) (21 ref.)—English summary.

5143. Mermis, Bernie & Ross, Don. (H. Hays State Coll., Kan.) **Rater agreement on the Reinforcement and Fear Survey Schedules.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 243-246.—Studied the report-behavior by outside raters of reinforcing and fear-producing stimuli for 5 adolescent psychiatric patients, on both a Reinforcement and a Fear Survey Schedule. Schedules were filled out by target Ss for themselves and then by 7 parents and 7 caretakers, as they thought the targets would fill them out. Correlations between the ratings by Ss and the outside raters showed rater-rater agreement was greater than rater-S agreement for both scales. Journal abstract.

5144. Miller, Arthur A., Burstein, Alvin G., & Leider, Robert J. (U. Michigan, Medical School) **Teaching and**

evaluation of diagnostic skills. *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 255-259.—Proposes a specific educational technique of observation and discussion of a brief diagnostic interview for the teaching, learning, and assessment of a group of skills central to the professional development of the young psychiatrist. This technique was applied over a 3-yr span in the training of 22 residents. With this method, observational and integrative skills as well as diagnostic activity can be assessed and demonstrated by the teacher in a format that stimulates the "learning alliance" and the resident's development of self-critical functions. Observations of frequent problems in the resident's work are presented, the residents' response to this method is described, and various aspects of the format are discussed.—*Journal abstract*.

5145. Overall, John E., Henry B. W., & Ford, Hamilton. (U. Texas, Medical School) **Background variables and outpatient psychopathology.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 303-309.—Obtained some 70 items of personal and social history plus Brief Psychiatric Rating Scale symptom rating profiles recorded by 2 different professional Os for a sample of 729 adult psychiatric outpatients. Personal and social characteristics of the patient himself and types of problems encountered by the patient in his social context proved to be the most relevant kinds of information. Items related to the social class of parental family and the type of precipitating event were found to be of lesser relevance. A minimum set of background variables necessary to account for much of the systematic variance in manifest psychopathology in the outpatient population are identified.—*Journal abstract*.

5146. Pancheri, Paolo & Liotti, Giovanni. (U. Rome, Inst. of Psychiatry, Italy) **Validazione clinica del multi-dimensionale drawing test.** [Clinical evaluation of the multi-dimensional drawing test.] *Rivista di Psichiatria*, 1970(Mar), Vol. 5(2), 116-134.—Examined 19 normal and 37 psychiatric Ss with Rene Block's multi-dimensional drawing test. This type of test utilizes drawing for diagnosis. A chronometer, white paper, and 7 felt pens of various colors are provided. S must make a design of free choice in 60 sec. and then begin another. Contents drawn by Ss were classified in 5 categories: objects, plants, animals, human beings, and special things. It is concluded that the multidimensional drawing test did not show enough specific sensitivity for use in differential diagnosis. (English summary)—A. M. Farfaglia.

5147. Pancheri, Paolo & Stracca, Massimiliano. (U. Rome, Inst. of Psychiatry, Italy) **Risultati del M.M.P.I. in 360 pazienti psichiatrici.** [Results of the MMPI in 360 psychiatric patients.] *Rivista di Psichiatria*, 1970(Mar), Vol. 5(2), 135-157.—Studies the results of the application of MMPI on a heterogeneous psychiatric population. 320 psychiatric and 108 normal 20-40 yr. old female Ss were administered the short form of the MMPI. Psychiatric Ss were divided into 4 groups: (a) schizophrenic, (b) depressive states, (c) psychopathic, and (d) neurotic. It is concluded that this psychodiagnostic test furnishes psychometric facts which correspond to psychopathological elements in the clinic. Some problems remain open: (a) the use of the control scales as clinical scales, and (b) the inclusion of the samples of each nosographic psychopathic group for which a clarification of the criteria is needed. (English summary) (17 ref.)—A. M. Farfaglia.

5148. Perez, Francisco & Satz, Paul. (U. Florida) **The effects of feedback on clinical prediction.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 465-466.—16 judges, 8 clinical psychologists (P) and 8 graduate students in psychology (G), were asked to predict length of stay in psychotherapy from MMPI profiles. Judges were randomly divided into feedback (FB) and no-feedback (NFB) conditions. It was hypothesized that judges in the FB condition would increase their judgmental accuracy and would do significantly better than judges in the NFB condition. The results, while in the predicted direction, were not significant, largely because of the high level of initial accuracy obtained on this clinically relevant task. Implications for training are discussed.—*Author abstract*.

5149. Pethő, Bertalan. (Medical U., Neuropsychiatric Clinic, Budapest, Hungary) **Tesztmódszerek pszichiátriai alkalmazásáról.** [Test methods in psychiatry.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 423-458.—Defines a psychological test as the means of sampling an S's behavior patterns within a closed sphere of phenomena by means of objective, standardized procedures. The development of test methods and their relevance to psychology and psychiatry are discussed. To avoid confusion between the 2 areas, it is suggested that (a) psychiatry should be the main reference point; (b) organic orientation should prevail; (c) test methods should be founded on sensorimotor phenomena; (d) quantitative tests should prevail over psychiatric examinations; (e) information should not be considered independently, but in a multidimensional context; and (f) the holopsychiatric approach should include a holistic study of man. (Russian summary) (8 p. ref.)—*English summary*.

5150. Quattlebaum, Lawrence F. & White, William F. (U. Georgia) **Relationships among the Quick Test, two measures of psychomotor functioning, and age.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 824-826.—As part of a routine testing battery, 180 neuro-psychiatric Ss were administered Form 1 of the Quick Test, the Bender Visual Motor Gestalt Test (scored by the J. D. Hain method), and the Memory-for-Designs Test. The relationships among the Quick Test and the 2 psychomotor tests were examined, taking age into consideration. It was suggested that the relationship between the Quick Test and psychomotor performance is probably similar to that of other measures of intelligence. Implications for the clinical use of these tests are discussed.—*Journal abstract*.

5151. Szyrnski, Victor. (U. Ottawa, Ontario, Canada) **Brief review of the "Two Houses Technique" in child psychiatry.** *Skolepsykologi*, 1970, Vol. 7(2), 113-120. Describes the test as an economical, quick, and valuable technique of establishing significant contact with the child. It provides indications of specific patterns or family dynamics.—P. Mylov.

BEHAVIOR DISORDER

5152. Warren, Richard J., et al. (Washington U., Medical School) **The hyperactive child syndrome: Normal chromosome findings.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 161-162.—Nuclear sex determinations were done on 82 males and 14 females under psychiatric care for the hyperactive child syndrome. Complete karyotype analysis was done on lymphocytes from peripheral blood of 20 male and 3

female Ss. No evidence of sex chromosome aneuploidy or of other chromosome abnormality was found. It is concluded that a recognizable chromosome abnormality is not a major cause of the hyperactive child syndrome. (15 ref.)—*Journal abstract.*

Drug Addiction

5153. Gilmour, Douglas G., et al. (New York U., Medical School) **Chromosomal aberrations in users of psychoactive drugs.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 268-272.—Cultured and examined peripheral blood leukocytes from 56 users of psychoactive drugs and 16 non-drug-users for the presence of structural chromosomal abnormalities. None of the Ss admitted recent exposure to x-rays, other irradiation, or viral infection. Drug-users were divided into 5 groups: (a) Ss who smoked marihuana lightly; (b) psychiatric patients treated with phenothiazine; and (c) 1 group each of heavy users of 2 or more combinations of marihuana, heroin, amphetamine, and LSD. With the exception of the controls and the light users of marihuana, all groups showed elevated incidences of chromosomal aberrations. Increases were not general in any 1 group, but were largely accounted for by a few Ss within each group with more than 1 aberration each. Although it may be that any or all of the drugs could damage chromosomes in this way, it seems more likely that some other factor or factors common to drug-users might be responsible.—*Journal abstract.*

5154. Mann, Edward T. (New Jersey Coll. of Medicine & Dentistry) **Male drug addiction and the Kahn Test of Symbol Arrangement.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 875-880.—Attempts to evaluate the usefulness of the Kahn Test of Symbol Arrangement (KTSA) for assessing the degree of character disturbance in drug addicts. The KTSA and WAIS were administered to 40 institutionalized 13-18 yr. old addicts over a 2-mo period. Evaluation of both semiobjective variables tapping cognitive-associative functioning and objective factors assessing more dynamic features was made. The composite symbol pattern for 40 Ss showed a close correspondence with that determined by past research for "character and behavior disorder" and the resulting diagnosis indicates little discrepancy from that obtained through psychiatric interviewing. The more clinical features of the KTSA generally support the diagnosis of characterological disturbance. In several cases it was felt that neurosis (obsessive-compulsive) and underlying schizophrenic process were more appropriate diagnoses. However, both quantitative and qualitative examination of KTSA performance show consistently strong trends typically found in most drug addicts.—*Journal abstract.*

5155. Mendiño, Joseph. **Drugs of addiction and non-addiction: Their use and abuse: A comprehensive bibliography 1960-1969.** Troy, N.Y.: Whitston, 1970. 315 p. \$11.50.

5156. Washbrook, R. A. (H. M. Prison, Birmingham, England) **A study of drug addicts in a British custodial environment.** *International Journal of Offender Therapy*, 1969, Vol. 13(2), 82-89.—Describes the present legal position and recent modifications of the British system. 37 16-26 yr. old addicts were observed in custody. Upon withdrawal, only 2 showed minor symptoms. It is suggested that "glory" be taken out of addiction and its treatment, that specialized treatment

centers may do more harm than good, that the "togetherness" of addict subculture should be combated, and normal attachments and interests developed. Concentration (a) on the defects of society, (b) on the family and environment, and (c) only lastly on the individual himself is recommended. Improving the community and good casework may be preferable to high-powered psychotherapy. (French, German, & Spanish summaries)—*Journal summary.*

5157. Wikler, Abraham. (U. Kentucky, Medical School) **Some implications of conditioning theory for problems of drug abuse.** *Behavioral Science*, 1971(Jan), Vol. 16(1), 92-97.—Analyzes the development of drug cults as a conditioning process. Examples are given of specific effects of alcohol, barbiturates, opiates, amphetamines, cocaine, marihuana, LSD, and other psychotomimetic drugs that can reinforce continued use of the drug. It is hypothesized that, through repeated temporal contiguity between such primary reinforcement and the performance of rituals, novitiates eventually learn to perceive the magical drug-effects defined by the cult and to experience them even without benefit of the drug when the rituals are performed (secondary reinforcement). It is suggested that the maintenance of secondarily reinforced behavior in the absence of further programmed reinforcement by the drug is a consequence of previous classical conditioning of primary drug effects and possibly, of interoceptive conditioning. Some therapeutic applications of conditioning theory, and expansion of basic psychopharmacological research as well as of educational and social ameliorative efforts in drug abuse control are discussed. (27 ref.)—*Journal abstract.*

Alcoholism

5158. Chodorkoff, Bernard. (Sinai Hosp., Detroit, Mich.) **Alcoholism: Some theoretical considerations.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 169-173. Integrates contributions from D. W. Winnicott (see PA, Vol. 41, 10649) and F. Jacobson with the observation that the alcoholic favors cathecting his body and somatic experiences in place of mental representations of persons, situations, and experience. In effect, a psychological state is produced similar to that of "splitting between psyche and soma" (Winnicott) and one in which "drive discharge is regressive" (Jackson). The case of a 40-yr-old female alcoholic is reported. *Journal abstract.*

5159. Garibay Patrón, Miguel. **Análisis de una psicoterapia de grupo con alcohólicos.** [Analysis of group psychotherapy with alcoholics.] *Revista Mexicana de Psicología*, 1970(Sep), Vol. 4(3), 117-124. The group therapy used by AA has proved to be effective and should be considered as a positive auxiliary technique to individual psychotherapy. It has aided the alcoholic to overcome his narcissism and relate to others, accept reality, experience a spiritual awakening, and be treated as a person as well as a patient. The alcoholic person is neurotic, and it is generally observed that, although he stops drinking, he often needs the individual psychotherapy of a psychiatrist in order to adjust. It is concluded that alcoholism in Mexico could be considerably reduced if the psychiatrist would first use the group psychotherapy offered by AA and then reinforce it with individual therapy.—D. H. Schuster.

5160. Hoffmann, Helmut; Wojnowicz, Eugene J., &

Anderson, Donald E. (Minnesota State Hosp., Willmar) **Analysis of drinking attitudes and drinking behavior in hospitalized alcoholics.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 83-88.—Factor analyzed responses from 211 male alcoholics hospitalized in 6 different alcoholism treatment centers to a 41-item inventory containing attitudes toward drinking and drinking behavior. 12 factors describing the symptomatology of alcoholism were found. It is concluded that drinking attitudes and drinking behavior as measured by this inventory appear to be multidimensional and discriminate between alcoholic and nonalcoholic populations.—*Journal abstract.*

5161. Horn, John L. & Wanberg, Kenneth W. (U. Denver) **Dimensions of perception of background and current situation of alcoholic patients.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 633-658.—Factor analysis of responses by 2032 alcoholics to a social-history questionnaire disclosed 7 factors relating to social and personal adjustment during childhood and 8 factors relating to current adjustment and problems. Further analysis revealed 2 broad distinctions, between childhood delinquency-anxiety symptoms and parental loss and illness, and between current social and intrapersonal maladjustment. (31 ref.)—*Journal abstract.*

5162. Keehn, J. D., Bloomfield, Frances F., & Hug, Mary A. (Alcoholism & Drug Addiction Research Foundation, Medical Care Unit, Toronto, Ontario, Canada) **Use of the Reinforcement Survey Schedule with alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 602-615.—The pleasure that 40 20-60 yr. old alcoholics derived from a number of objects, activities, and situations was similar to that shown by a nonalcoholic population, as measured by the Reinforcement Survey Schedule. 1/4 of the alcoholics derived no pleasure from alcoholic beverages, while 4 derived much pleasure. Treatment implications are discussed.—*Journal abstract.*

5163. Miller, Byron A., Pokorny, Alex D., & Kansas, Thomas E. (Veterans Administration Hosp., Houston, Tex.) **Problems in treating homeless, jobless alcoholics.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 98-99.—Compared 35 delayed-exit alcoholics with 115 Ss who had been discharged from an alcoholic treatment program. The delayed-exit Ss were (a) more depressive, uncooperative, and evasive; (b) were lacking in drive and self-confidence; (c) were socially withdrawn and spent most of their time alone; (d) drank more often to excess, to spite someone, and to ameliorate physical pain; (e) preferred wine and beer; (f) attended AA more frequently; (g) were less vocationally motivated; and (h) were more depressed, psychasthenic, and socially isolated on the MMPI. Ss were similar to those usually called homeless, jobless alcoholics. It is recommended that a special program be designed for their rehabilitation.—S. Knapp.

5164. Nathan, Peter E., Zare, Nancy C., Ferneau, Ernest W., & Lowenstein, Leah M. (Boston City Hosp., Alcohol Study Unit, Mass.) **Effects of congener differences in alcoholic beverages on the behavior of alcoholics.** *Quarterly Journal of Studies on Alcohol Supplement*, 1970(May), No. 5, 87-100. Observed the operant, physiological, psychological, and social behavior of 8 middle-aged Skid Row men alcoholics, 4 in each of 2 30-day studies. An 18-day drinking period was preceded by a 6-day predrinking period and followed by a 6-day withdrawal period. The 30 days were divided

into alternate 3-day segments, one of socialization, the other of restriction to individual rooms. In Study I, Ss could drink only a 43% alcohol solution colored with caramel for 9 days and only bourbon the next 9 days. In Study II they drank bourbon for the 1st 9 days and then vodka. Beverages were available in exchange for reinforcement points earned on an operant console during the predrinking and drinking periods. In both studies Ss earned points at high rates in the predrinking period spent them all during the early part of drinking, then resumed working for points, but at slower rates. All Ss peaked at or above a blood alcohol level of 200 mg/100 ml during the 1st days of drinking. No consistent differences in blood alcohol levels attributed to beverage difference were noted, nor any pattern of beverage preference or congener effects. The usual drinking pattern produced alternation between low and high (up to 300 mg/100 ml) blood alcohol levels. Most Ss became more sociable at start of drinking; anxiety, depression, and hostility increased during drinking. Wittenborn Psychiatric Rating Scales reflected changes from normal to grossly psychotic behavior in some very intoxicated Ss. Ataxia measures were significantly different during drinking, and performance on 2 of the 3 measures was better at blood alcohol levels below 150 mg/100 ml than at higher levels. The incidence of nystagmus and other nystagmoid movements increased with duration of drinking. In all tests no consistent differences in behavior as a function of differences in congener of the beverages were observed.—*Journal abstract.*

5165. Paige, Paul E., La Pointe, William, & Krueger, Ann. (Camarillo State Hosp., Calif.) **The marital dyad as a diagnostic and treatment variable in alcohol addiction.** *Psychology*, 1971(Feb), Vol. 8(1), 64-73.

Investigated personality characteristics of male alcoholics and their wives. The characteristics of both partners were compared and evaluated in terms of their marital interaction and the alcoholic condition. 25 male alcoholics and their wives were tested with the MMPI and analyses were conducted through the use of the psychological dimensions of the MMPI and 40 subscales. Results indicate that on 3 subscales the wives were higher than the reported means, on 4 of the subscales the alcoholic husbands were extreme, and on 6 of the subscales both the husbands and wives were extreme which indicated shared pathological characteristics within their relationship. These characteristics are discussed regarding previous findings and implications for treatment. Findings indicate that the marital dyad of the alcoholic is a stagnant and unexciting relationship. Both appear to be unable to satisfy each other's needs for contact and involvement in any healthy and adaptive way, due primarily to a limited repertory (ego) of appropriate experiences. (22 ref.)—*Journal summary.*

5166. Reinhardt, James M. **Alcoholism and culture conflict in the U.S.A.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 177-181.—Reports that the individual's failure to deal with the conflicting forces in his culture may result in alcoholism. It is suggested that man needs a social milieu that offers him identifications he can trust. Alcoholics often suffer from a sense of hollowness and defeat. Though they may feel quite adequate at home, they feel haunted by a sense of unworthiness when in the world. Cultures that stimulate ambition beyond the opportunities available may create a feeling of despair in an individual. (French, German, & Spanish summaries)—*Journal summary.*

5167. Rubington, Earl. (Northeastern U.) **Referral,**

past treatment contacts, and length of stay in a halfway house: Notes on consistency of societal reactions to chronic drunkenness offenders. *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 659-668.—Most of the members of a halfway house who were referred from jails stayed less than 28 days, while over 1/2 of those referred from sources such as alcoholism clinics and hospitals stayed longer. Long-term members also had more previous alcoholism treatment contacts than did short-term members, who, it is suggested, have been exposed to more negative and inconsistent societal reactions and develop excessive aspirations to conformity and an unstable self-image.—*Journal abstract*.

5168. Ryback, Ralph S. (McLean Hosp., Belmont, Mass.) **Alcohol amnesia: Observations in seven drinking inpatient alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 616-632.—Alcoholic blackouts were observed in 5 of 7 alcoholics while drinking in an experimental setting. The blackouts usually occurred after a rapid rise in blood alcohol levels and involved amnesia during a block of time rather than for specific events. (81 ref.)—*Journal abstract*.

5169. Segal, B. M., Kushnarev, V. M., Urakov, I. G., & Misionzhnik, E. U. (Moscow Psychiatric Research Inst., USSR) **Alcoholism and disruption of the activity of deep cerebral structures: Clinical-laboratory research.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 587-601.—Clinical and laboratory findings were similar in 515 21-65 yr. old alcoholics and in 120 men with postinfection diencephalic syndromes, suggesting that the hypothalamic centers play an important role in the development of alcohol addiction. (47 ref.)—*Journal abstract*.

5170. Süle, Ferencné & Süle, Ferenc. **Szinpramistest vizsgálat alkoholista betegekben.** [Colour Pyramid Test examinations of alcoholic patients.] *Psichológiai Tanulmányok*, 1968, No. 11, 731-738.—Compared test records of 150 alcoholic males with those of 100 normal males. Significant differences between the 2 groups are that the alcoholic Ss are dependent, irritable personalities, their internal control is low, and their extroversion is below normal as it lacks stability, masculinity, and constancy. They have a specific need for being emotionally obsessed; this hinders the development of adequate interpersonal relations and intrapsychic structures and leads to the appearance of psychopathic traits. (Russian summary)—*English summary*.

5171. Tomsovic, Milan. (Veterans Administration Hosp., Sheridan, Wyo.) **A follow-up study of discharged alcoholics.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 94-97.—Investigated drinking behavior, employment, and attendance at AA of 266 Ss who had completed a 90-day intensive alcoholic rehabilitation program. Answers to questionnaires sent 3, 6, and 12 mo. after completing the program revealed a steady decline in all areas. Comparison between schizophrenic and nonschizophrenic alcoholics revealed no significant differences between the groups. The best prognoses were for the neurotic alcoholics who showed enthusiasm for the program, ability to change, and utilization of AA after release. Limitations of the study are described.—*S. Knapp*.

5172. Ward, Robert F. & Faillace, Louis A. (Baltimore City Hosp., Md.) **The alcoholic and his helpers: A systems view.** *Quarterly Journal of Studies on Alcohol*,

1970(Sep), Vol. 31(3-A), 684-691.—When viewed within the framework of general systems theory, alcoholism is a symptom of a complex interactional process. Pathological drinking is a circular, self-perpetuating behavior which is maintained to preserve homeostasis. The patterns of the alcoholic's relations with his family, physicians, police, religious groups, and his employer are described. (24 ref.)—*Journal abstract*.

Suicide

5173. ———. **Mythology of suicide.** *British Medical Journal*, 1970(Mar), Vol. 1(5699), 770.—People admitted to hospital after deliberate acts of self-damage often deny suicidal intention. Some doctors, coroners, and members of the general public have accepted the explanation that the drug was taken automatically, without intention. "Automatism" is discussed, with the conclusion that in some cases it is claimed because it is a respectable version of suicide, but this interpretation probably does not apply to all instances of "automatism."—*S. R. Diamond*.

5174. Brockopp, Gene W. & Lester, David. (Suicide Prevention & Crisis Service, Inc., Buffalo, N.Y.) **Time competence and suicidal history.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 80.—Administered the 23-item Time Competence scale of the Personal Orientation Inventory to 20 psychiatric patients who had attempted suicide and 20 patients who had not. No significant differences between the 2 groups on their time competence was found.—*S. Knapp*.

5175. Lester, David. (Suicide Prevention & Crisis Service, Inc., Buffalo, N.Y.) **Cognitive complexity of the suicidal individual.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 158.—Selected 14 undergraduates who had threatened or attempted suicide and 15 undergraduates who had not considered suicide but had neuroticism scores as high as the suicidal Ss. Ss were compared on measures of cognitive complexity and suicidal potential. No significant differences were found.—*S. Knapp*.

5176. Lester, David. (Suicide Prevention & Crisis Service, Inc., Buffalo, N.Y.) **MMPI scores of old and young completed suicides.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 146.—Examined the MMPI protocols of 52 15-81 yr. old white males who had completed suicide. Older Ss showed (a) significantly more response conformity, (b) less denial of personal inadequacies, (c) a tendency to use physical symptoms as a means of resolving conflicts less, and (d) a greater tendency to paranoia. Results are compared with those obtained in other studies of nonsuicidal males.—*S. Knapp*.

5177. Segal, Bernard E. & Humphrey, John. (Dartmouth Coll.) **A comparison of suicide victims and suicide attempters in New Hampshire.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 830-838.—Reports indications from settings previously unreported of differences between victims of suicide and hospitalized suicide attempters, comparing social characteristics, place of residence, and methods used to attempt suicide. The suicide victims were 701 males and 239 females who committed suicide in New Hampshire between 1955 and 1967. The suicide attempters were 46 males and 54 females admitted during a 6-mo period in 1969 to the state's only public inpatient psychiatric

facility. Results suggest that (a) a higher proportion of attempters are young and female; (b) among both attempters and victims, men tend to use more certain suicide methods than women; (c) attempters use less lethal methods than victims; and (d) "the treated population of suicide attempters is different from, and at lower risk than, the largely unseen population of prospective suicide victims." It is possible to identify members of attempter groups whose risk of suicide is 10 or more times greater than other attempter groups or the public in general, e.g., a white male, over 65, living alone, who has attempted suicide within the previous year or 2. It is concluded that an emphasis on risk categories rather than individual descriptive characteristics is a necessary step toward identifying those who need help. (17 ref.)—*P. McMillan*.

Crime

5178. Campbell, Jay & Clannon, Thomas L. (Pennsylvania State U.) **From the Medical Facility of the California Department of Correction: Questionnaire-study of the aspects considered relevant by its group therapists.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 158-164.—Evaluated the responses of 27 therapists on a questionnaire concerning therapist attributes, group therapy techniques, and responsive patients. There was wide agreement that a positive personality and intuition were more important than highly specialized training. In contrast, there was significantly less consensus as to whether psychiatric diagnoses affected therapeutic results. Psychosis, constitutional defects, and early traumas were not regarded as constituting a negative prognosis. (French, German, & Spanish summaries)—*Journal summary*.

5179. Christiansen, Karl O. (Criminal Inst., Copenhagen, Denmark) **Kriminaliteten i en større dansk tvillingpopulation: Socialpsykologisk set.** [Delinquency in a greater Danish population of twins: From a social-psychological point of view.] *Nordisk Psykologi*, 1969, Vol. 21(1-2), 43-44.—Presents a simple tabulation of 8000 pairs of twins, born between 1881-1910. The frequency of concordance is only $\frac{1}{2}$, the expected amount, i.e., 19.2% for the 218 pairs of both type, ranging from 35.8% for identical male twins to 4.3% for fraternal female twins.—*P. Mylov*.

5180. Coleman, Benjamin I. (Dept. of Health, New York, N.Y.) **Reality therapy with offenders: II. Practice.** *International Journal of Offender Therapy*, 1970, Vol. 14(1), 26-30.—Describes in concrete details how 4 nonverbal and unwilling male patients were involved in therapy and taught to express themselves, adjusted better, and developed more interests. (French, German, & Spanish summaries)—*Journal summary*.

5181. Kertész, Imre. **A metodológia és a metodika kérdései a kriminálpszichológiában.** [Problems of methodology in criminal psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 487-501.—Psychological methodology means the application of the laws and categories of dialectic materialism to mental phenomena. The development of concrete research methods is founded on that of methodology. In the field of criminal psychology, healthy, normal individuals are morally distorted and socially inadapted. The methods employed in criminal psychology coincide fundamentally with general psychological methods, with the difference that

the application of methods is determined by different aims. It is a surplus requirement that the methods must be not only exact and reliable in themselves, but must also comply with various other requirements, i.e., possible social implications, the observation of the relevant laws, the safeguarding of the lawful rights of the S. and the recording of examination data in accordance with legal procedures. (Russian summary) (30 ref.)

English abstract

5182. Russel, Donald H. (Dept. of Mental Health, Boston, Mass.) **From the Massachusetts Court Clinics, U.S.A.: II. Diagnosing offender patients.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 147-152.—Continues the study by D. H. Russel (see PA, Vol. 46:Issue 3) on court clinics. Since the sociolegal subdivision of offenses does not correspond to medicopsychological concepts, there is no reason to assume that any given "offense" is motivated by typical psychological factors. A medicopsychological approach considers each case individually, in terms of causation, therapy, and prognosis. 6 subgroups are described: (a) normal persons, (b) neurotics, (c) psychotics, (d) deprived persons, (e) character disorders, and (f) organic conditions. The court clinics operate mainly on presentence and probation levels. Since each court caters to vastly different socioeconomic communities, their selection of cases referred for treatment and diagnosis varies considerably. (French, German, & Spanish summaries)—*Journal summary*.

5183. Russell, Donald H. (Dept. of Mental Health, Boston, Mass.) **From the Massachusetts Court Clinics, U.S.A.: I. A study of its administration and community aspects.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 140-147.—Describes the history and workings of court clinics which provide diagnosis and treatment in close working relationship with the court personnel. Plans for the development of closer cooperation with other community agencies and better community awareness are described. (French, German, & Spanish summaries) *Journal summary*.

5184. Schmideberg, Melitta. (Assn. for Psychiatric Treatment of Offenders, London, England) **Reality therapy with offenders: I. Principles.** *International Journal of Offender Therapy*, 1970, Vol. 14(1), 19-25.—Describes the task of therapy in improvement of the patient's reality sense. The offender must become aware that social adjustment is in his own long term interest. Therapy should try to develop feelings of affection and guilt and make these acceptable to the patient. (French, German, & Spanish summaries)—*Journal summary*.

5185. Sjöberg, Lennart. (Uppsala U., Sweden) **Är frihet det bästa straffet? [Is freedom the best penalty?]** *Nordisk Psykologi*, 1969, Vol. 21(3), 212-217.—Results from an investigation of the relation between recidivism and legal sanctions indicate that severe sentences were associated with higher probabilities of relapses. However, an insufficient design (ex-post-facto experiment), unreliable measures, and statistical regression make the results invalid. *P. Mylov*.

5186. Whiskin, Frederick E. (Brookline Court Clinic, Mass.) **From the Massachusetts Court Clinics, U.S.A.: III. Enforced psychotherapy.** *International Journal of Offender Therapy*, 1969, Vol. 13(3), 152-157.—Continues the study by D. H. Russel (see PA, Vol. 46:Issue 3) on court clinics. The court may make psychotherapy a "condition" of probation or of suspended sentence. Paradoxically, certain offenders re-

spond well to enforced therapy because, having no choice, it saves them from admitting that there is something wrong with themselves. The authority of the court may be invoked to make the patient face reality, and after their defenses have broken down, they become responsive to influence. Enforced therapy may turn into a genuine relation with insight. It may also help offenders with a neurotic sense of guilt and those with superego deficiency. (French, German, & Spanish summaries)—*Journal summary*.

Juvenile Delinquency

5187. Beshai, James A. (Duquesne U.) **Behavioral correlates of the EEG in delinquents.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 459-460.—2 delinquent groups divided in terms of presence or absence of definitive signs of EEG dysrhythmia were matched with normal Ss and given a battery of tests measuring: extroversion-neuroticism, high risk-taking, psychomotor inhibition, and future-past discrepancy ratings. Results show no significant differences between the 2 EEG groups on the 1st 2 measures, but there were significant differences on the last 2. Further research on measures of sensory and motor control may still support the EEG as a reliable predictor of cortical maturation and developmental characteristics of delinquents. All tests used showed significant differences between delinquent and normal Ss.—*Author abstract*.

5188. Branton, Joan. **The Holtzman Inkblot Technique: A preliminary study with a British delinquent sample.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 23-26.—Form A of the Holtzman Inkblot Technique was administered to 25 19-20 yr. old British delinquents. Protocols were scored in accordance with Holtzman's criteria, and the results compared with the original standardization samples. Data indicate the technique to be a valid instrument for use with this population. Possible future work is outlined.—*Journal abstract*.

5189. Desai, Haribhai G. (Saurashtra U., Bhavnagar, India) **Factors relating to juvenile delinquency.** *Indian Educational Review*, 1970(Jul), Vol. 5(2), 74-83.—A review of the literature included studies published during 1936-1967. Discussions and summaries of studies are organized under 4 major headings: personality factors, home and family conditions, mass media of entertainment and communication, and physical environmental factors. Studies indicate that delinquency is assignable to no single universal source, it springs from a wide variety of subversive circumstances. (35 ref.)—*K. C. Panda*.

5190. Hernandez Martinez, Maria Virtudes. **Del "comportamiento" de la delinquencia juvenil.** [On the behavior of juvenile delinquency.] *Revista del Instituto de la Juventud*, 1970(Jun), Vol. 29, 51-71.—Examines the general behavior of youth today, its deviations (delinquency), and the opinions of experts in this field. Within the context of a general social maladjustment of youth, the symptoms (violence, aggressiveness, drug abuse, etc.), causes (population growth, excessive freedom, influence of the media), manifestations, and various approaches to solving these problems are discussed. It is concluded that (a) many conflicting theories exist when dealing with this crisis; (b) besides the influence of the media, the predisposition

of the individual is an important factor that contributes to the "vulnerability" of the S; (c) there is a desperate need for a concerted social awareness, action, and change; and (d) the media is a poor influence on youth and needs to be improved.—*S. Maze*.

5191. Hespel, Jean. **Etude du sur-moi chez le délinquant juvénile à travers le test P.N.** [The superego of juvenile delinquents as revealed by the P.N. Test.] *Revue de Psychologie Appliquée*, 1970, Vol. 20(2), 101-109.—Reviews steps in the hypothesized internalization of the superego. Representative conduct of Ss confirming the steps is suggested. Situations evoked in the Patte Noir Test are in turn ascribed to the behavior for a given step.—*K. J. Hartman*.

5192. Larson, James D., Fitzgerald, Bernard J., & Martin, Robert. (U. Wyoming) **Social class, reported parental behavior and delinquency status.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 323-327.—Evaluated the influence of social class on reported parental behavior as a significant factor in social and solitary delinquency status. 46 delinquents were selected and classified by social class and type of delinquency behavior. Ss were then tested with a modified Parent Child Relations Questionnaire. Results indicate, contrary to previous research, the social class cannot be considered a significant factor in differentiating social and solitary delinquents. Reported parental behavior of delinquents was also not highly related to social class. Findings support earlier research suggesting that solitary and social delinquents vary in etiology of their delinquency.—*Journal abstract*.

5193. Pippin, Louis D. (North Texas State U.) **The relationships between personality adjustments and perceived behavior of teenage boys at Boys Ranch, Texas.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3349.

5194. Plocek, Karel. (Psychological Counseling Centre, Borough National Committee, Brno, Czechoslovakia) **Význam školského neprospěchu pro vznik a vývoj delikvencí mladistvých.** [Significance of bad progress in school for the beginning and development of delinquency in the young.] *Jednotná Škola*, 1970(Dec), Vol. 22(5), 931-942. Proposes that delinquency in the young is conditioned in its beginning and developed by many factors, both specific and nonspecific. Delinquency is seen as generally preceded by a long lasting antisocial development with accompanying changes in personality and especially in character. An important symptom of antisocial development in school age children is poor progress in school, eventually out of proportion with their age, which is not caused by lack of intelligence. A lack of cooperation by the young delinquent in any attempt at their education and training also were noted. From an analysis of the causes of poor progress in school of 100 delinquents a general clinical psychological examination showed that poor progress or under average progress for reasons other than lack of intelligence was the most significant and frequent (68%) of the Ss symptom of antisocial development. The educational implications for the prevention of social noncooperation are discussed. (Russian summary) *English summary*.

5195. Riscalla, Louise M. (New Jersey State Diagnostic Center, Menlo Park) **Crisis therapy with adolescents.** *International Journal of Offender Therapy*, 1970, Vol. 14(1), 40-43. Reports that diagnostic interviews offer the psychologist an opportunity to establish

contact with an apprehended youngster in need of direction. The 1st aim in treating offenders is to establish quick rapport so that patients return for a 2nd interview, and to prevent them from "acting out"; to calm them to work with their environment, mobilize any potential helpfulness, and cooperate with the court and its probation and parole services. The crisis may make him more responsive and more ready to discuss his problems. (French, German, & Spanish summaries)—*Journal summary*.

5196. Romano, Mary E. (Public Schools, New York, N.Y.) **Helping "pre-offenders" in the school.** *International Journal of Offender Therapy*, 1970, Vol. 14(1), 36-40. Suggests that there is a negative and possibly self-fulfilling forecast implied in diagnosing a child as a "preoffender". Even very difficult children often react positively to the interest shown by the guiding counselor. Mental health agencies in the actual school setting could be of immeasurable benefit. (French, German, & Spanish summaries)—*Journal summary*.

5197. Vedeler, Gerdt H. (U. Oslo, Inst. of Criminology, Norway) **Institusjonsbehandling: Skisse til en klinisk-sosilogisk modell for beskrivelse av terapiprosesser i det lille ungdomspsykiatriske behandlingshjem.** [Residential treatment of delinquent youth: Toward a clinical-sociological model for description of therapeutic processes in the small psychiatric treatment home for adolescents.] *Nordisk Psykologi*, 1969, Vol. 21(3), 203-211.—The model is outlined. Lack of positive results of traditional residential treatment for delinquent youth is admitted. This fact, however, is not viewed as necessarily discouraging provided the underlying therapeutic processes are properly understood. Emphasis on description of institutional content and therapeutic processes as opposed to measurement of results is advocated as the type of research which currently is most needed. A combination of clinical and sociological approaches is emphasized with reference to the social system aspects of institutional life and therapy. Some unique characteristics of residential treatment are listed. Factors of special therapeutic relevance are discussed: intention and therapeutic philosophy, clientele, institutional milieu and the outside society; various interdependent relations between these factors are listed on an individual and on a system level. A comparative study of different institutions is suggested with the aim of formulating general principles and indications for residential treatment.—*English summary*.

Homosexuality & Sexual Deviation

5198. Buckner, H. Taylor. (Sir George Williams U., Montreal, Quebec, Canada) **The transvestic career path.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 381-389.—Presents conclusions gathered from intensive interviews with 7 transvestites and a survey of 262 transvestites. 5 distinct steps to becoming a transvestite were found to be based on a biologically or socially induced passivity: (a) the association of feminine wearing apparel with sexual gratification, usually through masturbation; (b) perception of some heterosexual difficulties; (c) blockage of the homosexual outlet with return to the earlier pattern of gratification; (d) elaboration of masturbation fantasies into the development of a feminine self; and (e) fixation of the gratification pattern in the identity of the transvestite. This pattern usually becomes fixed by 18-20 yr. of age.

The end result is the creation of a female alter ego. The transvestite "internalizes and carries out within himself both the erotic and social aspects of what is ordinarily a process which would link him to the social order." Recommendations for therapy include a supportive sociosexual milieu. (21 ref.)—S. Knapp.

5199. Kockott, G. (Max-Planck Inst. of Psychiatry, Munich, W. Germany) **Psychiatrische- und lerntheoretische Aspekte der Transsexualität und des Transvestitismus.** [Psychiatric and research-hypothetical aspects of trans-sexualism and transvestism.] *Nervenarzt*, 1970(Aug), Vol. 41(8), 387-391.—Transsexualism is generally considered today to be an extreme variation of transvestism. The transsexual person identifies himself fully with the opposite sex and wants his body changed accordingly. In spite of the fact that the desire for a sexual-transformation operation is no ideal pathogonomic criterium for transsexualism, it is used as such, as no better criterium is available at present. A few pertinent psychopathological points are outlined. Etiological considerations are discussed in some detail on a hypothetical basis. As a working hypothesis, it appears useful to consider transvestism as a conditioned behavior; some statistical and experimental examination results are given in support. Therapeutical treatments are described with preference given to the use of aversion therapy. (38 ref.)—P. von Toal.

5200. Stoller, Robert J. (U. California, Medical School, Los Angeles) **The term "transvestism."** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 230-237.—Reports that current terminology in psychiatry has accepted "transvestism" not only as a term, but also as a diagnosis. A review is presented of clinical data on 60 males with behavior which is classified as "transvestism" as it is used in the literature. 7 groups of cross-dressers are distinguished and 6 case examples are presented. In each case, it is suggested that the term "transvestism" is wrongly being used as a diagnosis and not as a symptom of deeper-lying psychological disorders. (19 ref.)—*Journal abstract*.

MENTAL DISORDER

5201. Agrawal, K. G. (National Inst. of Health Administration & Education, New Delhi, India) **Personality dimensions as revealed by the Hindi personality differential.** *Indian Journal of Psychology*, 1970(Mar), Vol. 45(1), 23-37.—40 personality concepts were rated by normal, neurotic, and schizophrenic Ss against 34 scales using Osgood's semantic differential technique. While clusters of factor loadings for the 3 groups have differences, basic factors are the same. 4 basic dimensions that emerged are: conformity, tough-mindedness, normalcy, and tenseness. The possibility of accepting these dimensions as personality dimensions is discussed. (22 ref.)—*Journal summary*.

5202. Agresti, Enzo & Taddei, Mario. (Provincial Neuropsychiatric Hosp., Florence, Italy) **In tema di Dismorfofobia: Studio clinico e fenomenologico.** [On the subject of dysmorphophobia: A clinical and phenomenological study.] *Rivista di Psichiatria*, 1970(May), Vol. 5(3), 224-248.—"After having illustrated some preliminary considerations about the 'living body' and phenomenology, the problem of dysmorphophobia from the nosographical viewpoint is examined phenomenologically. 6 clinical dysmorphophobic syndromes are considered from the viewpoint of psychopathology

and psychodynamics. It is concluded that on the phenomenological level the dysmorphophobic manifestations indicate a change of the 'co-existence' which concretizes itself in the esthetic-formal sphere." (English summary) (15 ref.)—*N. De Palma*.

5203. **Beiser, Morton.** (Harvard School of Public Health, Boston, Mass.) **A study of personality assets in a rural community.** *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 244-254.—Studied the adult population in a rural county in maritime Canada to (a) identify personality attributes considered personal assets, and (b) determine the relevance of these attitudes to positive mental health and psychiatric disorder. The rationale for selection of these particular traits is described. Using epidemiological techniques, a group of 64 psychiatrically disturbed individuals and a group of 59 healthy, well-adjusted people were identified. Ss were studied intensively for 5 yr. Methods included psychiatric interviewing, collecting community information and medical data, and psychological testing. A list of personality attributes which seem to equip people to deal with this particular environment was evolved. (33 ref.)—*Journal abstract*.

5204. **Cardona Lopez, Luz M.** **El psicópata de William McCord-Joan McCord.** [The psychopathology of William McCord-Joan McCord.] *Revista Mexicana de Psicología*, 1970(Sep), Vol. 4(3), 125-131.—Discusses the definition, historical background, causes, diagnosis, treatment, and sociolegal implications of a psychopathic condition and proposes that: (a) a psychopath is an asocial, impulsive, aggressive, and unprincipled S who has difficulty in adapting and relating to his environment; (b) his condition can be due to hereditary, neurological, environmental and/or neurosocial factors; (c) diagnosis of a psychopath is based on characteristics, e.g., egocentrism, superficiality, intense anger, fear of rejection; (d) adequate treatment is hard to find although psychodrama, individual therapy, psychoanalysis, drugs, etc., are suggested with special emphasis on Wiltwick's method of rapport, tolerance, group influence and advice for children; and (e) laws regarding mental patients and psychopaths should be revised. It is concluded that studies undertaken in the past 150 yr. have led to nothing concrete and that a more thorough analysis of this problem is necessary. *D. H. Schuster*.

5205. **Conte, Hope R.** (Bronx State Hosp., N.Y.) **Studies of body image: Body worries and body discomforts.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 595-596. Tests of body image concerned with body worries and body discomforts were administered to 165 individuals. Ss included normal senior citizens, hospitalized geriatric mental patients, geriatric ex-mental patients, residents of a home for the aged, and middle-aged schizophrenics. Female groups, but not male groups, differed significantly on both measures and had more discomforts and worries than did the males. The oldest group scored lowest on both measures, while a group of middle-aged schizophrenics scored highest. The data suggest that a person's bodily worries and discomforts are not related to age per se, but reflect special life circumstances.—*Author abstract*.

5206. **Dawson, E. B., Moore, T. D., & McGanity, W. J.** (U. Texas, Medical School, Galveston) **The mathematical relationship of drinking water lithium and rainfall to mental hospital admission.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 811-820.—De-

scribes a study comparing the level of lithium in the drinking water of 27 Texas communities and the frequency and type of state mental hospital admissions, using data from a National Nutritional Survey in Texas. Environmental factors, i.e., altitude, temperature, and rainfall, were also examined for possible influences. Multiple samples of local tap water were measured for lithium content and state hospital admission data examined for a 2-yr period. Results indicate that (a) lithium was present in measurable amounts in the drinking water of 22 county seats; and (b) the number of patient 1st admissions and readmissions (and the diagnosis of personality disorder, psychosis, and neurosis) from each county was "inversely proportional to the lithium content of their residential drinking water," most significant in the eastern portion of the state. It is suggested that the quantity of lithium in local drinking water may depend either on soil content or on the amount leached from the soil and diluted by the amount of regional rainfall. J. F. Cade's theory that lithium is an essential element to man is discussed. A table giving identifying characteristics of the 27 counties involved is included.—*P. McMillan*.

5207. **Dewald, Paul A.** (St. Louis U., Medical School) **Folie à deux and the function of reality testing.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(1), 390-395.—Presents the case history of a variant of folie à deux in which 1 member was both subject and object of the delusional ideas of the other. This resulted in severe distortion of the member's sense of identity and confidence in his perception of reality. A 45-yr-old businessman sought psychiatric help in determining what his behavior had actually been. Although a poor lover with premature ejaculation and low sexual drive, his wife had continuously accused him of promiscuity. After protesting his innocence for many years, the patient began to capitulate to her demands for a confession. As the details of the fantasized promiscuities became more elaborate, his wife became more loving and responsive, while the patient became more and more unsure of the line between fact and fantasy. Dramatic symptom remission occurred when the patient was able to transfer his dependency needs to the therapist. It is concluded that the patient's reality-testing functions could not withstand the "combined pressures of the threat of loss of the object and the simultaneous promise of drive-derivative gratification if he accepted the object's version of reality." A conceptual formulation of the development of reality testing in the child is presented.—*S. Knapp*.

5208. **Eicke, Dieter.** (43 Ungererstr., Munich, W. Germany) **Die Introjektion des eigenen Produktes.** [The introjection of own product] *Zeitschrift für Psycho-somatische Medizin und Psychoanalyse*, 1970(Apr), Vol. 16(2), 165-177.—Describes 8 cases of the depressive mechanism. This mechanism (introjection of own product) is a component of the psychopathology of depression. The typically depressive mechanism is regarded as a turning of aggression against the self. There is not sufficient stabilization between self and self-ideal and often there is a narcissistic identification with a lost love object and hate of it because of its loss. The self image of the described patients was determined by their intolerable aggression and acted out in role identifications, there being also close connections with somatization. The aggressive impulses that are turned against the self have a distinct anal level of development. All patients

observed identified with the opposite sex indicating a fixation on the anal phase. The depressive frequently regresses to oral needs because anal satisfaction is not possible. The sooner the patient is made aware of his own aggression, the faster he will get out of it.—*B. Schay.*

5209. Kroecker, L. L. & Oetting, E. R. (U. Rochester) **Inadequacies of the acquisition responses of mental patients on an FI schedule.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 723-729.—Defines mental illness as a failure of the individual to assess his environment accurately and to respond optimally to environmental contingencies. An experimental operant conditioning laboratory was utilized to assess an individual's ability to develop a new behavior repertoire appropriate to unique stimulus conditions. 10 mental patients and 5 normal controls were placed on a fixed interval 1-min schedule for 40 min. and their acquisition responses analyzed for rate, variability, and efficiency. No mental patient performed the task adequately while several normal Ss performed in a highly efficient manner. The most frequent error for mental patients was in the direction of behavioral excess. Diagnostic implications are discussed.—*Journal abstract.*

5210. Leff, Melitta J., Roatch, John F., & Bunney, William E. **Environmental factors preceding the onset of severe depressions.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 293-311.—Studied environmental and behavioral events occurring prior to the onset of depression in 13 patients with endogenous and 27 patients with nonendogenous depression. Ss reported 2-6 environmental stresses with a clustering in the mo. prior to breakdown. 5 of the most common events were (a) threat to sexual identity, (b) change in marital relationship, (c) geographical move, (d) made to face denied reality, and (e) physical illness. It was noted that 18 of 28 Ss on whom data were available showed moderate to severe deprivation of contact with a parent of the same sex during their developmental period and Stress a. Instances of endogenous depression were lower in this study and those Ss revealed the same types of stressful events as the other Ss. Implications for biological studies of endogenous depression are discussed. The case histories of 6 Ss with endogenous depression are described. (41 ref.)—*S. Knapp.*

5211. Maisel, Robert. (U. California, Davis) **Decision-making in a commitment court.** *Psychiatry, Washington, D.C.*, 1970(Aug), Vol. 33(3), 352-361.—Presents an analysis of the rationale of commitment proceedings based on observation of 50 hearings and published research. The formal structure of commitment proceedings is outlined. 2 characteristics of the hearings are noted and discussed: the speed and lack of controversy. Typically, hearings were finished in 8-10 min., with a range of 2-20 min. The judges tended to follow the advice of the medical examiners, who in turn seemed to routinely follow hospital recommendations. The patient himself was often ignored and rarely had counsel. Once having been hospitalized for behaving in a socially obnoxious manner, it is difficult for the person to convince the staff that he is not sick. The predispositions of the staff to consider the person sick and the effects of the process of becoming a mental patient are discussed. It is suggested that the courts reexamine their role in the commitment process and become aware of the seriousness of incarceration for mental illness. (17 ref.)—*S. Knapp.*

5212. Masterson, James F. (Cornell U., Medical

School) **Treatment of the adolescent with borderline syndrome: A problem in separation-individuation.** *Bulletin of the Menninger Clinic*, 1971(Jan), Vol. 35(1) 5-18.—Consensus of psychoanalytic theory now holds that the basic psychopathology is not the presenting symptom but a specific and stable form of psychologic ego structure, i.e., a developmental arrest, reflecting a separation-individuation problem. "This brief paper applies this theory to the diagnosis, psychodynamics, and treatment of the Border-line Adolescent." A case report of a 16-yr-old girl suffering from a borderline syndrome is presented.—*J. Z. Elias.*

5213. Meyer, Adolf E. & Otte, Hilka. (U. Hamburg, Medical Clinic, W. Germany) **Zur orthogonalen Dimensionalität der Anorexia nervosa bei Frauen.** [Orthogonal dimensionality of anorexia nervosa in women.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Apr), Vol. 16(2), 142-156.—Analyzes the interrelation of several components in the psychic picture of anorexia nervosa and the connections with the somatic symptoms of these psychosocial variables. Beginning in 1961, all anorexia patients of a university clinic were given standardized examinations. 31 patients were chosen at random for a factor analysis based on 6 important factors. 53 relevant anamnestic, clinical, biochemical, and test-psychological variables were intercorrelated. Several factor-analytical dimensions matched previously observed characteristics of anorexia nervosa. However, this clinical picture of anorexia nervosa proved to be pluridimensional in the factor analysis. The analysis showed a covariation of helplessness, orality in the narrower sense, and introversion. Negativism, however, had 2 independent facets, extrapunitive nonconformism and negation of psychic problems. Since the factors are presented orthogonally, the nature of the psychological correlations is not adequately determined because certain correlations are overestimated while others tend to be underestimated. The advantage of rectangular factor solution lies in the greater clarity and interpretability enabling the development of new, precise hypotheses. (26 ref.) *B. Schn.*

5214. Mundy, Jean. (Long Island U.) **Content analysis: TAT Card 12BG—the rowboat as a symbol for female body image and sexual activity.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 219-222. Analyzes the symbolic meaning of stories told by 12 female mental patients in response to TAT Card 12BG. The guidelines set down by L. Phillips and J. Smith for content analysis of the Rorschach are used.—*Journal abstract.*

5215. Penk, W. E. & Van Hoose, T. A. (Veterans Administration Hosp., Dallas, Tex.) **Structural properties of cognition and maladjustment.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 471-472.—It has been hypothesized that structural variables in cognition vary as a function of maladjustment—specifically, that schizophrenics and controls, when structuring conceptions of acquaintances, do not differ in dimensionality and articulation, but that schizophrenics are comparatively ambivalent and less affectively involved. These hypotheses were tested using nonsocial stimuli, i.e., common objects. Contrary to findings with social stimuli, controls obtained significantly higher dimensionality and articulation scores; neurotics were significantly lower in dimensionality, articulation, and affective salience; and schizophrenics were significantly

higher in pretest ambivalence and posttest affective salience. Findings are discussed in terms of differential effects of meaning domain and interaction of maladjustment on structural properties.—*Author abstract*

5216. Plisztor, Ferenc. (Medical U. Budapest, Neurological & Psychiatric Clinic, Hungary) **A craniumra és a cerebrumra vonatkozó hipochondriás félelmek és léveseszmék keletkezésének néhány törvényszerűsége.** [Some regularities in the derivation of hypochondriac anxieties and illusions concerning the cranium and cerebrum.] *Pszichológiai Tanulmányok*, 1968, No. 11, 477-492.—In a casuistically interesting sample of 10 psychotics and 12 severely hypochondriac neurotics, hypochondriac symptoms localized cranio-cerebrally occurred in 9 Ss as the exclusive symptoms and in the other 13 as the dominant symptoms. On the basis of phenomenological and pathogenetic criteria, 5 pathomechanical types as models are distinguished. In the 1st (3 Ss) intracranial coenesthesia were not accompanied by striking anxieties nor pathological interpretation. Hypochondriasis manifested itself only in the constricted focusing on complaints. In 4 Ss phobic disposition associated with external iatrogenic effects was outstanding. In another 3 Ss bizarre cerebral sensations were dominant with secondary interpretation. In the last 2 classes including 12 Ss, the lowered achievement level and concomitant experiences of inefficiency due to schizophrenia, depression, or cerebral lesions, came to be converted into hypochondriasis characterized by a host of interpretive doxogenic symptoms. Among the factors determining the hypochondriac symptoms and their localization, cranio-cerebral sensations, and external iatrogenic effects are stressed. With regard to interpretations, the importance of the use of individual organ symbols and predisposing personality traits are indicated. (Russian summary)—*English summary.*

5217. Reiss, David & Elstein, Arthur S. (National Inst. of Mental Health, Adult Psychiatry Branch, Bethesda, Md.) **Perceptual and cognitive resources of family members: Contrasts between families of paranoid and nonparanoid schizophrenics and nonschizophrenic psychiatric patients.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 121-134. Tested 3 groups of families, each consisting of a father, mother, and hospitalized child, with a battery of perceptual and cognitive tasks. 8 of the children were diagnosed as paranoid schizophrenics, 8 were diagnosed as nonparanoid schizophrenics, and 8 (control group) were diagnosed as character disorder, depressive reaction, or adjustment reaction of adolescence. Families of schizophrenics had lower mean scores for the Shipley-Institute of Living Scale for Measuring Intellectual Impairment. Abstraction scale, showed more frequent overexclusions on S Epstein's Inclusion Test and showed substantially reduced reversal rates on reversible figures. As a unit, most families with schizophrenics (a) have an inability to discern the underlying pattern or deep structure in an array of ordered stimuli, (b) rigidly apply limited or conservative generalization in constraining the environment in order to impose stability on it, and (c) show a strong preference for conventional rather than personal reality. (91 ref.)—*Journal abstract.*

5218. Sperling, Eckhard & Massing, Almut. (1. Göttingen, Psychiatric Clinic, W. Germany) **Der familiäre Hintergrund der Anorexia nervosa und die**

sich daraus ergebenden therapeutischen Schwierigkeiten. [The family background of anorexia nervosa and the resulting therapeutic difficulties.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Apr), Vol. 16(2), 130-141.—After a theoretical introduction concerning the state of psychoanalytic and empirical social research, interaction with reference to the family is discussed. Using the example of anorexia mentalis (anorexia nervosa), hypotheses for the investigation of the sociodynamics and psychogenesis of this disease are developed. Role stereotypes and shifts in dominance are described in particular. The meaning of the family as a resistance carrier is emphasized with a loss-of-treatment quota of about 1/3 of the diseased. Hypotheses are statistically examined by means of the matching method based on the records of 115 cases of anorexia (100 case histories, 15 new studies) and a random control group of 15 "healthy" persons. Results show dominance by members outside of the core family (e.g., maternal grandmothers), an extremely high incidence of working mothers in anorectic girls as well as a significantly high rate of illness among their fathers. Ideological fixations in the family and their effects on treatment are discussed. Initially the mutual designation of blame plays a central part as resistance. (25 ref.)—*H. Schay.*

Neurosis & Emotional Disorder

5219. Goldstein, Alan J. (Temple U., Medical School) **Case conference: Some aspects of agoraphobia.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 305-313.—Presents a case conference in which 3 cases of agoraphobia are discussed showing the variety of factors relevant to different cases. Therapeutic strategy determined by the features of the case, are noted.—*Journal abstract.*

5220. Letourneau, Jacques F. & Strub, Bertrand. (1. Montreal, School of Optometry, Quebec, Canada) **The perception of reversible and ambiguous figures among obsessional neurotics.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Oct), Vol. 47(10), 887-892. 2 reversals drawings and 2 series of ambiguous pictures were shown to 13 obsessional neurotics and to 30 normal controls. Monocular and binocular tests were made. Results indicate that the Ss show a smaller amount of reversibility in the perception of the drawings than normal persons. The ambiguous pictures are also perceived with greater rigidity in Ss than in normal individuals. Rivalry does not seem to have a precise influence on the phenomenon. (18 ref.)—*Journal abstract.*

5221. Mendels, Joseph. (1. Princeton, N.J., Depression Research Program) **Concepts of depression.** New York, N.Y.: John Wiley, 1970. xiii, 124 p. \$4.00 (hbk), \$2.95 (paper).

5222. Pitts, Ferris N. (Washington U., Medical School) **Biochemical factors in anxiety neurosis.** *Behavior Science*, 1971(Jan), Vol. 16(1), 1-10.—Presents a selective review describing the history of the development of the concept of anxiety neurosis and details the clinical picture and natural history of the disorder. Many studies of physiological and biochemical differences between anxiety neurotics are briefly reviewed. The production of anxiety attacks in susceptible individuals with the infusion of 1-adrenergic agonists, epinephrine, epinephrine and the end-product of their activation of

the anaerobic glycolytic pathway (lactate) is covered in detail, with emphasis on the evidence for this phenomenon. The prevention of such episodes by calcium ion and β -adrenergic blockade by propranolol is discussed. The challenging prospects for the future clarification of the chemical mechanism of expression of anxiety symptoms (and attacks), as well as the future of chemotherapy of anxiety, is examined. (2 p. ref.)—*Journal abstract.*

5223. Pohlen, Manfred. (Max-Planck Inst., Munich, W. Germany) Eine Errötungspsychose: Über die strukturelle Verwandtschaft von Erythrophobie und Beobachtungs-Verfolgungswahn. [A blushing psychosis: The structural relationship of erythrophobia and persecution delusion.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Jan), Vol. 16(1), 53-79.—States the case history of a 33-yr-old male who was treated for erythrophobia over a 2-yr period (350 sessions). In the course of treatment, a transference neurosis became a narcissistic neurosis. It was found that patient's persecution delusion actually was a shield against homosexual tendencies. The various forms of delusion served to cover up his delusion of greatness; to show to the whole world his unique phallic greatness. The typical schizophrenic exhibitionism intermingled with the exhibitionism of the erythrophobe. The phallus image of the self remained at the level of its concrete meaning instead of reaching metaphorization. The narcissistic problems of ego and self-genesis, as experienced in therapy with the patient, showed the transition, i.e., structural relationship between erythrophobia and paranoid developments. The border between both forms of disease had fallen but the consciousness of delusion of the erythrophobe is not identical with that of the schizophrenic. Erythrophobia, a pregenital disorder, should be classified as a narcissistic neurosis placed between schizophrenic psychoses and transference neuroses. (33 ref.)—*B. Schay.*

5224. Tellenbach, Hubert. *Transkulturelle Aspekte der Melancholie*. [Transcultural aspects of melancholy.] *Jahrbuch für Psychologie, Psychotherapie und medizinische Anthropologie*, 1969, Vol. 17(1-2), 13-27.—Transcultural psychology concerns the comparison of contemporary phenomena of foreign cultures. A survey of the literature demonstrates lower incidence of melancholy and higher incidence of mania in cultures unpenetrated by Western civilization. 3 main factors correspond to higher incidences of melancholy: (a) higher social status and income, (b) urbanization, and (c) Westernization. Melancholy in the Far East exists in the form of hypochondria, agitation, exhaustion, and conversion reaction. Guilt feelings rarely lead to suicide. (38 ref.)—*B. Stanton.*

5225. van der Veen, Ferdinand; Howard, Kenneth I., & O'Mahoney, Michael T. (Inst. for Juvenile Research, Chicago, Ill.) Dimensions of the family concept in relation to emotional disorder and family position. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 451-452.—The Family Concept Test, consisting of 80 items descriptive of the entire family unit, was factor-analyzed and yielded 9 meaningful dimensions. 18 groups, based on emotional disturbance and family position (father, mother, daughter, and son) were scored on these dimensions and compared by means of analyses of variance. In families with a disturbed as contrasted with a nondisturbed child all members perceived less affectionate trust and outgoing enjoyment in the family. In

addition, disturbed children viewed their families as less sociable and less responsible, while their parents saw less considerateness and less shared activity. In all families children perceived less family trust, communication, togetherness, and importance of the family than their parents.—*Author abstract.*

5226. Winokur, George; Cadoret, Remi; Dorzab, Joe, & Baker, Max. (Washington U., Medical School) Depressive disease: A genetic study. *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 135-144.—Examined 31 male and 69 female depressives. A family history was obtained on each, and a family study was done on 129 primary relatives. An analysis of the genetic data is in favor of the possibility that at least 2 types of depressive illness exist. The prototype of depression spectrum disease would be a female with an onset prior to age 40 in whose family more depression is seen in female relatives than male relatives and the deficit in males is made up by alcoholism and sociopathy. The 2nd prototype is that of pure depressive disease in which the S is a male whose illness starts after age 40 and in whom there are equal amounts of depression in both male and female relatives and no large amount of alcoholism or sociopathy in the males. (20 ref.)—*Journal abstract.*

5227. Wolpe, Joseph. (Temple U., Health Sciences Center) Identifying the antecedents of an agoraphobic reaction: A transcript. *Journal of Behavior Therapy & Experimental Psychiatry*, 1970(Dec), Vol. 1(4), 299-304.—Presents an interview with a 48-yr-old woman directed to identifying the essential stimuli to her agoraphobic reactions. Her anxiety had decreased considerably as a result of favorable changes procured in her marital situation. At 1 stage of her life, when she removed herself from a particular stress situation, no harm resulted; but at another stage, when the same stress was inescapable, she experienced mounting anxiety, on the basis of which the agoraphobic reaction came to be established.—*Journal abstract.*

Psychosis

5228. Beigel, Allan & Murphy, Dennis L. (U. Arizona, Medical School) Unipolar and bipolar affective illness: Differences in clinical characteristics accompanying depression. *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 215-220.—Made a comparison of the clinical characteristics of the depressive state between 25 patients with a diagnosis of depressive psychosis (unipolar) and 25 patients with a diagnosis of manic-depressive psychosis (bipolar). Ss were observed for a 14-day drug-free period in a research ward during which time mania was absent. Higher levels of physical activity, overt expression of anger, and somatic complaints differentiated the unipolar from the bipolar Ss who tended to be less active and more socially withdrawn. Anxiety and psychotic behavior were not differentiating characteristics, although the former approached significance. Evidence from biological, genetic, and other clinical studies supports the hypothesis that depressive psychosis and manic-depressive psychosis may be distinctly different types of affective disorder. (29 ref.)—*Journal abstract.*

5229. Holfeld, H. & Leuner, H. (Research Inst for Psychology & Psychotherapy, Munich, W. Germany) Der "Vatermord" als zentraler Konflikt einer psychogenen Psychose. ["Patricide" as central con-

[lict of a psychogenic psychosis] *Nervenarzt*, 1969(May), Vol. 40(5), 203-209.—Discusses an unusual psychogenic psychosis and its psychodynamics. The dynamics in the case of a 31-yr-old male S centered around the theme of patricide. When he was 15, S betrayed an officer, who could have been his father, to the Gestapo. The officer was later hanged in the presence of the boy. It is shown, with the aid of repressed experiences, that an unsolved and very serious father-son rivalry existed, leading to a patricide fixation. The treatment revealed to S the existence of his self-destructive, murderous aggression against his father and opened to him the road to a corrective emotional experience.—*P. von Toal*.

5230. Rose, H. K. (Hanover Medical School, Psychiatric Clinic, W. Germany) *Überlegungen zu einem sozialpsychiatrischen Reaktivierungsprogramm bei chronisch Psychotischen*. [Reflections concerning a social-psychiatric reactivation program with chronically psychotic patients.] *Nervenarzt*, 1969(Jun), Vol. 40(6), 255-264.—Discusses in relation to a reactivation of chronic psychotics, the reoccupation techniques used in psychotherapy, and the occupation and work therapies with their characteristics, possibilities, and adequate indication position. A theoretical substantiation of their effects in social-psychiatric practice is attempted. Based on experiences in a rehabilitation center, a staged plan is sketched for the application of the methods of the detached-permissive exercise treatment up to a professional education. The value of an organized work therapy is presented as a differential instrument of clinical treatment. (62 ref.)—*P. von Toal*.

Schizophrenia

5231. Anokhina, I. P. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) *Rol' izmenenii neirokhimicheskikh funktsii mozga v formirovani i techenii psikhopatologicheskikh sostoyani*. [Role of changes in the neurochemical functions of the brain in the formation and course of psychopathological states.] In V. V. Parin (Ed.), "Sistemnaya organizatsiya fiziologicheskikh funktsii." (See PA, Vol. 44:4609) 82-96.—Presents the results of a number of studies: (a) the functional state of cerebral adrenergic and cholinergic structures in schizophrenics in various stages and forms of the psychosis; (b) polygraphic recordings of bioelectrical activity, autonomic and motor functions against a background of various sensory and verbal stimuli; (c) pharmacological agents which affect central neurochemical functions; and (d) the central mechanism of action of psychomimetic LSD-25 in rabbits. LSD-25, amiazine (chlorpromazine), benactyzine, and serotonin were injected in several regions of the cortex and subcortex, with EEG recordings undertaken from different regions of the brain. The character, degree, and localization of pathology in the central adrenergic systems and the changes in the functions of other neurochemical structures in the brain determine considerably the psychotic picture. Major functional changes observed occurred in the structures involved in the Papez-Nauta circle mainly, in the mesencephalic reticular formation and the limbic system. It is suggested that disturbances of the activity of the cerebral adrenergic substrate, resulting in psychoses, are related to insufficiency of the enzyme systems which destroy, in particular, catecholamines of the MAO group. (English summary) (33 ref.)—*J. D. London*.

5232. Bannister, Donald. (Medical Research Council London, England) *Schizophrenia: Carnival mirror of coherence*. *Psychology Today*, 1971(Jan), Vol. 4(8), 66-69, 84.—Using the Kelly grid method of assessing the interrelationships of interpersonal constructs, it is concluded that schizophrenic language is incomprehensible primarily because it is noise—not because it is a secret language or a private code. The schizophrenic's language is especially loose when dealing with interpersonal relations while only somewhat disturbed when dealing with objects. This finding is not compatible with biological theories of the origin of schizophrenia. Research is in progress to discover the manner in which disorganized language develops.—*J. J. Parnes*.

5233. Dunham, H. Warren. (Lafayette Clinic, Detroit, Mich.) *Sociocultural studies of schizophrenia*. *Archives of General Psychiatry*, 1971(Mar), Vol. 24(3), 206-214.—Reviews and analyzes various studies of schizophrenia. The 2 major approaches to schizophrenia are derived from the "soft" diagnosis which has its roots in psychoanalytic, learning, socialization, and anomie theories and the "hard" diagnosis which stems from E. Kraepelin's classical work on dementia praecox. It is concluded that psychiatry must reject narrow approaches and move to new levels of synthesis if the riddle of schizophrenia is to be solved. (59 ref.)—*Journal abstract*.

5234. Friedman, Martha S. (Columbia U.) *Family life education for expressed acceptance of self and others*. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3335.

5235. Hartung, Jürgen R. (L. Houston) *A review of procedures to increase verbal imitation skills and functional speech in autistic children*. *Journal of Speech & Hearing Disorders*, 1970(Aug), Vol. 35(3), 203-217.—Discusses the importance of establishing verbal behavior in nonspeaking, autistic children, use of some of the theoretical foundation underlying verbal conditioning, and reviews procedures and related theoretical implications. Verbal imitation behavior appears to precede the development of more complex verbal behavior. An imitative repertoire is a prerequisite for each of the stages of verbal conditioning. Imprecise imitation of verbal training assumes that the imitator already imitates the verbal responses of others consistently. (2 p. ref.)—*C. C. Benoit*.

5236. Lane, Ellen. (Case Western Reserve U.) *Biological factors affecting estimates of fertility rates of schizophrenics*. *Journal of Psychology*, 1971(May), Vol. 78(1), 49-63.—Analysis of commonly used sampling methods indicates that selection, attrition, and reproduction rates have been substantially underestimated in past studies. More accurate estimates would be obtained by considering the effects on schizophrenic fertility of previously uncontrolled variables, e.g., sex, economic level, race, institutionalization, time of assessment, divorce, ileptimacy, and chronicity. (26 ref.)—*Author abstract*.

5237. Mourer, Stephen D. (South Florida) *Some issues regarding semantic generalization in schizophrenia*. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 64(Pt. 1), 449-450.—Predictions are derived from a theory of disordered thought offered by Chapman, Chapman and Miller concerning the conditions under which schizophrenic Ss exhibit excessive generalization errors. The theory assumes that both the schizophrenic and normal

are biased toward responding to words in terms of the words strongest aspects of meaning, but that schizophrenics are more strongly biased toward this than are normals. 26 schizophrenic and 27 normal Ss were instructed to indicate by pressing buttons marked "yes" and "no" whether or not test words presented in serial fashion on a memory drum had appeared on a previous training list. "Yes" responses to test words not appearing on a previous training list were the measure of generalization errors. The predictions were supported in that schizophrenics made significantly more errors to words on the test list that shared strong meaning responses ($p < .01$), but normal Ss did not. In addition, the difference between generalization errors to words sharing strong and weak meaning responses was significantly greater for schizophrenics than for normals ($p < .05$).—*Author abstract.*

5238. Serra, A., Pontalti, C., & Pontalti-Venier, S. (Catholic U. of the Sacred Heart, Medical Faculty, Rome, Italy) **Sulla genetica della schizofrenia: I. Retrospective.** [On the genetics of schizophrenia: I. Retrospectives.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Sep), Vol. 31(5), 417-450.—On the basis of a review of the literature, monogenic theories of any kind, including simple Mendelian models, do not show sufficient grounds for support. A multifactorial genetic model, probably of the additive type, fits available data best. More recent studies are gradually bringing into light specific familial and social causes for many, as yet unexplained, clinical symptoms.—*L. L'Abate.*

5239. Stevens, Barbara C. (Inst. of Psychiatry, London, England) **Illegitimate fertility of psychotic women.** *Journal of Biosocial Science*, 1970(Jan), Vol. 2(1), 17-30.—Earlier studies on psychotic patients suggested that their illegitimate fertility was lower than expected on the basis of general population trends. Present findings were part of a study on marriage and fertility of women suffering from schizophrenia and affective disorders. 1300 women were selected from admissions to a London hospital during 1955-1963 and followed up until August 1966. The proportion of total live births which were illegitimate was 19.1% among the schizophrenics, 7.5% among the affectives, and 12.7% in the general population of London during 1961. The high illegitimate fertility of schizophrenics is probably related to their low probability of marriage; more births occurred before than after admission, especially among the older group of Ss suffering from affective disorders. Most of the births were the result of a serious relationship rather than casual promiscuity, and they were more frequent among Jamaican Ss and Ss with probable psychopathic personalities in both clinical groups. The genetic and social relevance of the study is discussed. (25 ref.)—*Journal abstract.*

5240. Taylor, Michael A. & Levine, Robert. (New York Medical Coll., N.Y.) **Puerperal schizophrenia: A physiological interaction between mother and fetus.** *Biological Psychiatry*, 1969(Jan), Vol. 1(1), 97-101.—Tested 2 hypotheses that (a) "prepartum schizophrenic psychoses should be associated with a lower incidence of male live births and a higher incidence of female live births"; and (b) that remissions of schizophrenia "occurring during pregnancy should be associated with a greater number of male live births, while exacerbations should be associated with a greater number of female live births." The charts of 25 acutely ill or schizophrenic clinic patients (mean age 22 yr.) were reviewed. Data

support both hypotheses. It is concluded that among pregnant schizophrenic women, "a male fetus suppresses the expression of acute psychotic symptoms, although a female fetus apparently has no such effect." "Such a view suggests a hormonal model based upon male fetal androgen and progesterone influence upon the maternal schizophrenic process...."—*P. McMillan.*

Schizophrenia Treatment

5241. Blumenthal, Irving J. (State U. New York Downstate Medical Center, Brooklyn) **Management of schizophrenia in the Veterans Administration.** *Psychosomatics*, 1971(Jan), Vol. 12(1), 61-68. Presents a historical survey of the treatment of the schizophrenic veteran in Veterans Administration hospitals. The development of psychopharmacological drugs has brought about reductions in the use of restraint measures and somatic therapies, e.g., ECT, insulin coma therapy, and lobotomy. The advent of the "open door" policy, chemotherapeutic cooperative studies, short-term hospitalization, intensive community care following discharge, and the "team" approach are noted. Because of the increased number of schizophrenic patients reentering the community, there is a need for outpatient services and community psychiatry. (17 ref.) *Journal summary.*

5242. Bonier, Richard J. & Koplosky, Annette (McLean Hosp., Belmont, Mass.) **The borderline adolescent in crisis intervention.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 437-438.—28 13-19 yr. adolescents were seen in crisis intervention for 4 treatment interviews following an intensive diagnostic process. 12 Ss were classified as borderline schizophrenics and 16 as nonborderline schizophrenics. They were matched for age, social class, IQ, and type of crisis treatment. 1/2 of each group was seen in family therapy and 1/2 in individually centered crisis intervention. Neither form of intervention appeared more effective though as long as a 2 1/2-yr follow-up indicated some improvement in the borderline group, and no improvement in nonborderline group. Groups differed statistically in precipitating factors. Type of intervention is described.—*Author abstract.*

5243. Graziano, Anthony M. (State U. New York Buffalo) **A group treatment approach to multiple problem behaviors of autistic children.** *Journal of Abnormal Children*, 1970(Sum), Vol. 36(10), 765-770. Describes a group behavior therapy approach involving social environment programming with a professional supervisor and a nonprofessional staff. 4 autistic children were observed individually and in a group to determine their gross behavioral deficits in various response classes. A range of response constituents was identified and techniques to stimulate and reinforce those responses were developed. The severely psychotic Ss with extreme deficit and surplus behavior were significantly improved in the 3 1/2-yr program of behavior modification.—*P. Hertzberg.*

5244. May, Philip R. (U. California, Neuropsychiatric Inst., Los Angeles) **Modifying health-care services for schizophrenic patients.** *Hospital & Community Psychiatry*, 1969(Dec), Vol. 20(12), 363-368. Reports a study which assigned 228 1st admission schizophrenic patients to 1 of 5 treatments: (a) individual psychotherapy; (b) an antipsychotic drug, trifluoperazine

psychosomatic research, and epidemiological and cross-cultural psychosomatic research. 3 psychosomatic problems of current interest are noted: (a) the side effect of oral contraceptive medication, (b) psychiatric implications of hemodialysis and renal transplantation, and (c) jejunoileal bypass in obesity. The future of psychosomatic research is discussed. (15 ref.)—A. Goldstein.

CASE HISTORY

5251. Belfer, Myron L. & d'Autremont, Chester C. (National Inst. of Mental Health, Bethesda, Md.) **Catatonia-like symptomatology: An interesting case.** *Archives of General Psychiatry*, 1971(Feb), Vol. 24(2), 119-120. Reports the case of a 16-yr-old boy admitted to a hospital in a condition resembling catatonia. Thorough diagnostic procedures revealed an arteriovenous malformation of the left frontal lobe which was resected. Postoperative follow-up indicated a return to full orientation and coherence. It is suggested that clinicians be aware of possible organic etiology of catatonia and catatonia-like symptomatology. Certain changes related to frontal lobe pathological abnormality are enumerated.—*Journal abstract.*

5252. Goldfield, Michael D. & Glick, Ira D. (Langley Porter Neuropsychiatric Inst. San Francisco, Calif.) **Self-mutilation of the female genitalia: A case report.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 843-845. Presents a case report of self-mutilation of the vagina. The patient was a 19-yr-old white unwed mother of a 2-yr-old child, and had been admitted to a gynecological service for investigation of vaginal bleeding which had occurred over a 2-yr period. In a discussion of the case, self-mutilation of the vagina is considered as part of a larger symptom complex, often consisting of a previous history of multiple hospitalizations, multiple surgeries, and sexual histories involving many partners with little emotional involvement. Such patients are usually egocentric, attention seeking, histrionic, and demanding, and may request multiple prescriptions for pain from many different physicians. Important clues in the physical examination are multiple abdominal scars, and evidence of self-induced dermatological excoriations. Self-mutilation should be strongly suspected in these kinds of patients who present with unexplained vaginal bleeding. *Journal summary.*

5253. Schachter, Mendel. (Marseille Committee of Emotionally Disturbed Children, France) **A propos d'une certaine prostitution dangereuse: La prostitution "acte gratuit" chez des grandes adolescentes: Contribution à la psychopathologie de la jeunesse féminine dite rebelle.** [A propos of dangerous prostitution: Prostitution as a "gratuitous act" in adolescents. Contribution to the psychopathology of rebellious young girls.] *Rivista di Psichiatria*, 1970(Mar), Vol. 5(2), 158-173. Presents 2 case histories of a 17-yr-old and a 24-yr-old females who developed habits of engaging in promiscuous sexual activity. An attempt is made to isolate the source of this activity. The average young adult female who engages in promiscuous sexual intercourse is: middle class, attached to a definite ethical and religious value system, college educated, and involved in latent family conflicts resulting from the establishment of faulty identification patterns. Prostitution as a "gratuitous act," is illustrated regarding 2 clinical and psychological observations, aiming to focus the attention on problems concerning the future of the

youth and peace of the society. (English summary) P. A. Stanton.

5254. Szegedi, Márton & Münich, Iván. **Szexuális motivációból elkövetett emberölés-sorozat pszichológiai elemzése.** [Psychological analysis of a murder series committed for sexual motives.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 272-284.—Presents a case study. Results based on an examination of the S's background and psychological tests (Rorschach 1A1 etc.), indicate that the S was not psychotic, he had an alienation tendency "which led to formation of secondary structures within his personality," he was psychosexually fixated on an autoerotic level making it impossible for him to develop heterosexual interests, and "the quantity and depth of information gained by the projective tests was superior to that obtained through observation" (English & Russian summaries) M. Moore.

5255. Villacián, J. M. & Ortiz Manchado, O. (I. Valladolid, Faculty of Medicine, Spain) **Acerca de un caso de síndrome de Klinefelter.** [Regarding a case of Klinefelter syndrome.] *Archivos de Neurobiología*, 1969(Jul), Vol. 32(3), 397-401.—Studied the case of a 51-yr-old male patient who was admitted 15 yr before for paraphrenic delirious-hallucinatory symptoms. The Klinefelter syndrome is characterized by gynecomastia (breast growth), an absence of spermatogenesis, and an increase of gonadotropines. S suffered from a dual personality: low intensity delirium suffered in silence and an almost normal personality. S presented no signs of oligophrenia which is a typical principle of the syndrome. There is an absence of sexual instinct and a weak capability to love. The most interesting fact is the karyotype XY/XXY/XXXY with abnormal cells being more numerous than normal cells. Only 1 other such case where mental retardation did not exist was reported by McSweeney, but in his case normal cells were more numerous. (English & French summaries)—4 M. Farfaglia.

MENTAL HEALTH & REHABILITATION

5256. ———. **Vocational development in a therapeutic community.** *Journal of Emotional Education*, 1970(Spring), Vol. 10(2), i-xxviii.—The Institute for Emotional Education is a therapeutic community committed to the advancement of "emotional education." Its therapeutic experiences include "social therapy" and "work therapy." Vocational development is directed primarily towards helping the client realize his full human potential. The vocational training includes the teaching of both basic skills and human relations. An important agent of vocational development in the therapeutic community is the "job forum." It secures information on client qualifications, researches available jobs, and matches clients to jobs. Emotional support is also rendered by the "job forum." It prepares documentation (resumes, etc.), provides role-playing opportunities, makes use of a "buddy system," and evaluates client interviews.—I. E. Shifren.

5257. Bishop, Ronald C. & Hill, James W. (Southern Illinois U.) **Effects of scheduled versus discretionary rests on the performance of handicapped workers.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 503-504.—10 handicapped soda-pop case repair workers in a sheltered workshop worked under 6 different rest/schedule schedules. The schedules ranged from the usual 15 min

midmorning and midafternoon to a schedule which permitted the worker to leave the job as often, and for as long as he wished. Dependent variables were duration and frequency of unscheduled rest pauses as well as quantity and quality of production. Significant changes in all 4 dependent variables were observed under the different conditions but they were unrelated to absolute quantity of time away from work. Under the schedule of complete freedom, workers maintained their original quantity of production while increasing quality above 4 of the other 5 conditions. Several theoretical positions are offered as possible explanations of the results.

5259. Felsenburg, Rosa. (Indiana-Purdue U., Indianapolis) Mental health services should be planned: The danger of "build now, think later." *International Journal of Offender Therapy*, 1970, Vol. 14(1), 31-36.—Considers that although helping children to adjust to their families is seen as the main aim by modern treatment ideology, many are still sent to residential facilities far away, sometimes even adjacent to mental hospitals. The detrimental consequences of poor planning and of unthinking stereotypes are highlighted (French, German, & Spanish summaries)—*Journal summary*

5260. Foster, Ashley. The use of psychological testing in rehabilitation planning for Alaskan native people. *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 146-152.—70 native Alaskans were individually administered either the WAIS (N = 42) or the Revised Beta test (N = 28) to determine rehabilitation guidance possibilities. Results indicate that while scores on subtests of the Revised Beta test did not differ significantly, poorest scores were in the area of visualization of similarities and dissimilarities and in the ability to envision a whole from the parts on a 2-dimensional plane. The WAIS Performance IQ scores were significantly higher than Verbal IQ scores, with highest scores in the Object Assembly subtest and lowest scores in the Arithmetic subtest. Results support the impression that the Alaska Native has a greater facility in the handling of concrete problems. It is concluded that while an IQ test alone cannot measure the abilities of native Alaskans, a good test can be useful in evaluating rehabilitation potential by providing a distribution of abilities and an indication of the degree to which such abilities differ from a normative population.—R. Wils.

5261. Gellman, Victor A. & Evans, Anne S. (Boston State Hosp., Mass.) Volunteer case aides rehabilitate chronic patients. *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 90-93.—Describes the training and activities of volunteers, trained and supervised by professional social workers, assigned to mental hospital inpatient. Volunteer characteristics, supervision and future work for the program are outlined. "Of great significance in the success of the volunteers is their belief that their patients have something worthwhile to contribute; that belief is transmitted to the patients."

5262. Hedberg, Magnus. (Royal Inst. of Technology, Stockholm, Sweden) Psykiologi och politik [Psychiatry and politics.] *Nordisk Psykiologi*, 1969, Vol. 21(1), 1-10.—Describes the criticism of the Swedish mental health campaign from young Marxists and left-wing doctors. The model is a simple class-divided society

where psychologists, sociologists and physicians are used by the state to control the real economy of the workers. It is feared that the existing psychiatric system should be taken over by political activity.—J. M. S.

5263. Janderholm Ek, Ann C. U. (Stockholm, Sweden) Mentalhälsokampanj. För vem? [Mental health campaign: For whom.] *Nordisk Psykiologi*, 1969, Vol. 21(5), 359-367.—In 1968, the Swedish organizations launched the project "Mental health in our working life." The Swedish Psychological Association was invited, but the representative was without any influence on the material. The author severely criticizes the implicit definition of mental health as adaptation to under a paternal regime. Conflicts seem to result in immature workers with no reference to the social situation. In the name of service over form, the population is proclaimed as incapable of anything but passive adaptation. A new psychology in service of the workers is called for.—J. M. S.

5264. M. Calhilo, A., Hector & Calderon S., Guillermo. El problema y el programa de salud mental en la ciudad de México. [The problem and mental health program in Mexico City.] *Revista Mexicana de Psicología*, 1970(Sep), Vol. 14(1), 1-14.

Examines the conditions that contribute to poor mental health in Mexico: (a) overpopulation, overcrowded living quarters, lack of privacy and freedom, and dangerous means of transportation, with special emphasis on overcrowding of psychiatric hospitals, and other. Data for mental illness are given. These include psychiatric hospital admissions (1960-68) and (30 out of 1000) and (132 out of 1000) respectively, mental defectives (11 out of 1000) and (132 out of 1000) respectively. A mental health program for the city of Mexico City is outlined, stressing the need for the development of the best mental health practice for the individual or group process in psychological disorders, extensive adequate therapeutic neuropsychiatry, and rehabilitation of mental patients. D. H. S. Hunter

5265. Melzer, H. & Ludwig, David. (Washington U.) Positive mental health of workers as related to memory optimism, work competency and personal life values. *Journal of Applied Social Psychology*, 1970, Vol. 1(1), 1-10.—Assesses the content of life and work memories and personal values of 141 workers to obtain indices of positive mental health. The categories used for assessing mental health were (a) self-regard, (b) maturity, (c) personal organization, and (d) relation to environment. These factors, as well as the total mental health index, were correlated with memory, optimism, personal life values, and competency, and personal values. Positive correlation was found for the relation of mental health and memory, optimism, and competency. Work life values were positively related to memory, optimism, and competency, and personal values were positively related to memory, optimism, and competency. The total mental health index was positively related to memory, optimism, and competency.

Social Casework

5282. Bailey, Margaret B. (Community Council of Greater New York, N.Y.) **Attitudes toward alcoholism before and after a training program for social caseworkers.** *Quarterly Journal of Studies on Alcohol*, 1970(Sep), Vol. 31(3-A), 669-683.—A 30-hour alcoholism training program for 71 social caseworkers resulted in some changes in their theoretical concepts of alcoholism but no change, or even slight movement away from the desired direction, in attitudes related to casework practice, treatment relationships, and motivation. (15 ref.)—*Journal abstract.*

5283. Pinderhughes, Charles A. (Tufts U., Medical School) **Non-pathological paranoia in social workers.** *Smith College Studies in Social Work*, 1970(Nov), Vol. 41(1), 1-9.—Emotionally healthy persons can align their false belief systems with those of their relatives, friends, schoolmates, and culture mates. By employing camouflaging labels they can avoid awareness of the paranoia. All such group members are sociable healthy persons who have aligned their paranoia to that of other persons to whom they have affiliative bonds. Their group is right and outsiders are wrong. Their paranoia is nonpathological because their capacity for social relationships is intact enough for their paranoia to be group-related.—*M. W. Linn.*

PHYSICAL HANDICAP

5284. Angliss, Valmai E. (Royal Children's Hosp., Parkville, Victoria, Australia) **Handicapped adolescents: Services and disservices.** *Australian Occupational Therapy Journal*, 1970(Jan), Vol. 17(1), 32-36.—Briefly considers some of the developmental tasks of the adolescent, the turmoil of the period, and the reactions of adults to various aspects. The handicapped adolescent is described as having an even more difficult, if not impossible task of development, especially if his handicap is severe and develops early in life. The relationship of the handicapped adolescent with his parents is characterized by guilt and restrictions. In the hospital setting, there is a tendency for the personnel to force the adolescent to suppress his aggressions and growing sexual awareness in order to keep him safely dependent. The case histories of a burned boy, a suicidal girl, and a girl with multiple congenital defects of the extremities are related. The failure of the hospitals to meet their needs is emphasized. A new center for the treatment of handicapped adolescents is described and programs are outlined which may alleviate some of the problems and deficiencies noted.—*S. Knapp.*

5285. Cameron, Paul; Van Hoeck, D., Weiss, N., & Kostin, M. (U. Louisville) **Happiness or life-satisfaction of the malformed.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 641-642.—How does the happiness of the malformed compare to that of normals in our society? A questionnaire indexing happiness, believed-difficulty-of-life, suicide contemplations and attempts, and frustration was administered to 144 handicapped and 151 normal persons in in- and outpatient clinics of 2 hospitals and university students. No difference was found between the 2 groups on reported happiness or degree of frustration. Some evidence suggested normals are more apt to contemplate and/or attempt suicide. The

handicapped judged their lives to be more difficult.—*Author abstract.*

5286. Johnson, Gil & Tuttle, Dean. (California State Dept. of Vocational Rehabilitation, Oakland) **Education and habilitation of multiply handicapped blind youth.** *New Outlook for the Blind*, 1971(Feb), Vol. 65(2), 56-62.—A joint project between the California School for the Blind, Berkeley, and the California State Department of Vocational Rehabilitation was instituted to help multiply handicapped blind students to adjusting better in their sighted communities and to further vocational and educational goals. 3 groups were identified, a high school, transitional work-experience, and work evaluation group. Various community agencies such as sheltered workshops were involved to which students residing at the School for the Blind traveled back and forth and individual and group counseling were made available. After 2½ yr. of experience it was felt worthwhile to continue the project. Among conclusions drawn was that working with multiple handicapped blind students required much time, a variety of services, and an individualized program. More adequate services were thought to be necessary.—*M. J. Stanford.*

5287. Kissin, Gerald. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Model for communicating the dynamics of the psychosocial adjustment of the handicapped.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 643-644.—Assisting the handicapped to a more effect psychosocial adaptation requires the enlistment of the efforts and the cooperation of many individuals in many disciplines. Examination of the success or failure of these efforts has shown that the quality of communication has been the prime determinant. A conceptual model visually depicted was evolved providing a base line upon which more effective communication can be developed. This is done by presenting a model of a simplistic developmental comparisons of the "life-space" of the "normal" and "handicapped" individual. By example and extension the model has been enlarged to encompass many of the functional elements of adjustment and "therapeutic intervention" which can be understood and utilized regardless of the original orientation of the individual(s) involved.—*Author abstract.*

5288. Neel, J. V., et al. (U. Michigan, Medical School) **The effects of parental consanguinity and inbreeding in Hirado, Japan: III. Vision and hearing.** *Human Heredity*, 1970, Vol. 20(2), 129-155.—Investigates the effects of parental consanguinity, age, and sex on defects of the eye and ear, accommodation, mean visual acuity, and mean db. of hearing loss at 4 frequencies in 1355 13-16 yr. old school children and their parents on Hirado Island, Japan. In the children, the effect of paternal and maternal inbreeding on these same indicators was also investigated. Age and sex effects had high levels of statistical significance, but, unlike the results on Hirado with respect to a variety of other indicators, socioeconomic effects are negligible. None of the regressions on the consanguinity or inbreeding is individually significant, nor is there any consistent pattern to the totality of the regressions. However, the sampling errors do not conflict with the significant positive findings regarding consanguinity effects in a previous study in Hiroshima and Nagasaki.—*Journal abstract.*

5289. Nel, B. F., Gouws, S. J., Sonnekus, M. C., & van der Stoep, F. **Essays on the handicapped child.**

treatment of wide-angle chronic glaucoma. *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Jun), Vol. 47(6), 473-480.—Reviews the rationale for use of adrenergic drugs in the treatment of glaucoma, and their application in research to manage wide-angle chronic glaucoma with CNS stimulants. Use and possible ocular and systemic complications resulting from treatment with MAO inhibitors and other major psychoanaleptics are considered. (19 ref.)—*Journal abstract*.

5298. Korb, Donald R. **Preparing the visually handicapped person for motor vehicle operation.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Aug), Vol. 47(8), 619-628.—Considers the possibilities of motor vehicle operation of persons wearing telescopic lenses. The biotic telescopic system is discussed with regard to spatial orientation, hypothetical prerequisites for motor vehicle operation, and clinical and subjective problems. Reasons for rejecting 35 out of 67 persons examined for telescopic lenses are elaborated. The successful driving experience of 26 Ss from this sample is discussed. These Ss wore telescopic lenses in which the magnification did not appear to be a factor in adaptation. They attained an acuity of 20/40 or better and had unblemished safety records. (28 ref.)—P. Hertzberg.

5299. Martin, Clessen J. & Herndon, Mary A. (Texas A & M U., Human Learning Research Lab.) **Facilitation of associative learning among blind children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 629-630.—Examined the associative strategies reported by blind children, and attempted to determine whether syntactical strategy aids facilitate the storage of verbal associations in memory for these Ss. The experimental (E) group received syntactical strategies during the learning task; the control (C) group was not provided with any E-supplied strategies. Performance of the E group was significantly superior to the C group. Blind Ss' verbal reports concerning how they learned the associations could be classified according to a previous classification scheme developed from sighted Ss' verbal reports.—*Author abstract*.

5300. Mayadas, Nazneen S. (Washington U.) **Selective factors associated with role behaviors of the blind.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3648-3649.

5301. Mehr, Helen M., Mehr, Edwin B., & Ault, Carroll. (Vision Rehabilitation Center of Santa Clara County, San Jose, Calif.) **Psychological aspects of low vision rehabilitation.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Aug), Vol. 47(8), 605-612.—Discusses the formation of a group of partially sighted 15-16 yr. old Ss and professional people of various disciplines to learn about the problems of being partially sighted. Group sizes varied from 8-15 individuals who met twice/mo for a total of 12 times. Observation of Ss regarding their handicap revealed (a) denial reactions, (b) over-independent reactions, and (c) defensive reactions. The discussion groups helped assuage fears, doubts, misperceptions, and embarrassment through the airing of mutual problems. Implications of findings, gained through a questionnaire sent to group members, were related to the partially sighted child, the adolescent, the young adult, the adult, and an elderly couple, as well as to the optometrist and ophthalmologist.—P. Hertzberg.

5302. Pálhegyi, Ferenc. **A fogalmak belső struk-**

túrjának kialakulása a vakok gondolkodásában. [Development of the central structure of concepts in the thought processes of the blind.] *Pszechologiai Tanulmányok*, 1968, No. 11, 545-564.—The psychol. "lifespace" of blind differs from that of seeing persons. External facts that have stimulus value for them are not exactly those to which the seeing respond. The implication of this for developmental psychology is that the blind "assimilate" the external world in a perceptual framework that has become, through their special adjustment, different from the normal, i.e., they adjust to an external world that has been "blindly" organized. Accordingly, it is assumed, that in developing their ideas different aspects of a concept will become central and of primary importance for the blind. For testing this assumption, object-sorting tasks were given to seeing and blind Ss. 1 of the tasks consisted of sorting 8 slips of paper into 2 groups. Of the 8 slips 4 were shaped differently, and 1/2 of the slips that had the same shape were thicker, the other 1/2 thinner. While the normal Ss sorted the slips on the basis of form, the blind performed the task on the basis of thickness. The experiments show that traits of objects negligible for the seeing are often essential for the blind. Data have led to conclusions that might be utilized in improving teaching methods for the blind. (Russian summary) (59 ref.)—*English summary*.

5303. Patton, William E. (New Hampshire Assn for the Blind, Concord) **Research on criteria for measuring mobility readiness of adventitiously blind adults.** *New Outlook for the Blind*, 1970(Mar), Vol. 64(3), 73-80.—Describes a 3-yr research oriented project conducted by the New Hampshire Association for the Blind. A teamwork approach to mobility service including coordinated casework counselling, was provided to 91 different legally blind persons on a community basis. There were 2 main goals: (a) to identify specific component factors of client readiness and (b) to construct "an instrument for measuring total readiness of adventitiously blind adults." The final research consisted of 14 criteria grouped into 3 general categories: physiological, psychosocial, and emotional. "A readiness instrument composed of 8 criteria was found to have a positive correlation with performance significant to less than the .1 level. It is concluded that "important specific factors related to readiness for mobility service" have been identified in this research. (22 ref.)—B. A. Burkard.

5304. Rosenbloom, Alfred A. (Illinois Coll. of Optometry) **Prognostic factors in low vision rehabilitation.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1970(Aug), Vol. 47(8), 600-605.—Determined the extent to which a patient continues to use a low vision aid. Follow-up low vision data are reported on 276 Ss randomly selected from the 1st 1000 cases reexamined in a low vision program within 6-12 mo. of their original examination. Types of ocular pathology and visual aid in relation to visual outcome were considered. It was found that over 75% of the Ss were successful in their ability to carry out meaningful visual tasks primarily at a near point. To insure continued successful use of the aid, it was suggested that Ss receive "the necessary adaptive training for mastery of the precise fixation demands involving head, hand and eye." It was found that almost all Ss required continued low vision care with regular follow-up intervals. Psychiatric evaluations and counseling were also found helpful.—P. Hertzberg.

5305. Sonnekus, M. C. **Die problematiek van de**

slegslende kind: 'N verkennende pedagogies-psigologiese ondersoek. [Problems of partially sighted children: Results of a pedagogical-psychological investigation.] *Opvoedkundige Studies*, No. 55, 77 p. Presents (a) a phenomenological study of the problems of the partially sighted child, and (b) the results of a pedagogical-psychological investigation of 18 partially sighted children. The standard approach which defines the child in terms of visual ability and the problem in terms of educational structure and apparatus is considered inadequate. Rather, the partially seeing child's problem is basically one of bodily experience and not only the lack of a part of his visual sense organ. The world of the partially sighted child is spatially distorted. Results of an investigation of partially sighted children revealed a manifold somatic burden, e.g., toxoplasmoses, retarded skeletal growth, high metabolism, and congenital cardiac defect. The home environments were characterized by manifold constitutional, organic, and pedagogical vacuums. Various psychopathological disturbances in the children were noted. A synthesis of the data is presented as a hypothetical world view of the partially sighted child. The pedagogical-didactic tasks with regard to these children are outlined emphasizing the importance of the home environment. (7 p. ref.)—*English summary*.

Deafness & Hearing Disorder

5307. Altshuler, Kenneth Z., Vollenweider, John, & Rainer, John D. (Columbia U., Coll. of Physicians & Surgeons) **Cross cultural study of personality in the deaf.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 631-632.—Describes an ongoing study which includes selected psychological tests given to hearing adolescents and comparable Ss with early total deafness. The study is a cross-cultural effort to define whether early language deprivation and limited language skills are inherently associated with impulsivity. It also includes a survey and clinical comparison of deaf psychiatric patients in New York State and throughout Yugoslavia. Psychological results thus far in the American section are reported. Scores on the Porteus Maze, Id-Ego-Superego and a new Draw-a-line test indicate greater impulsivity in the deaf, but the relative absence of a relationship between an individual's scores on the various measures suggests that impulsivity is multifactorial and comprises a number of different qualities.—*Author abstract*.

5308. Bowe, Frank G. (5708 16th Ave., Hyattsville, Md.) **Educational, psychological, and occupational aspects of the nonwhite deaf population.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 633-634.—Information from widely scattered fragmented sources is synthesized to present an overview of knowledge relating to nonwhite deaf persons—Negro, Puerto Rican, and Indian. This survey reveals undereducation and underemployment markedly in excess of that found for white deaf people. Perhaps the most significant finding of this survey concerns the paucity of information available on this segment of the deaf population. The need for further research and services is both crucial and immediate.—*Author abstract*.

5309. Chovan, William L. & McGettigan, James F. (Western Carolina U.) **The effects of vocal mediating responses on visual motor tasks with deaf and hearing children.** *Exceptional Children*, 1971(Feb), Vol. 37(6), 435-446.—Investigated the effects of vocal labeling on short-term memory with 2 MA levels of 60 deaf and 30 hearing children in order to determine the nature of the interaction among vocal labels, age levels, and a design arrangement task. It was found that 6-yr-old deaf and hearing children performed the same while 9-yr-old hearing children showed better recall than their deaf peers, with and without vocal labels. For the deaf, vocal labeling tended to have an interfering effect at the older levels, in part because of the competing stimuli in vocal auditory and visual-motor responses. (25 ref.)—*Journal abstract*.

5310. Fitzgerald, Mary D., Sifton, Ann B., & Freeman, McConnell. (Vanderbilt U.) **Audiometric, developmental, and learning characteristics of a group of rubella deaf children.** *Journal of Speech & Hearing Disorders*, 1970(Aug), Vol. 35(3), 218-228. Studied audiometric, developmental, and intellectual characteristics in 19 3-yr-old rubella children. These Ss showed a profound hearing loss (mean best binatural average = 91 db.) with a predominantly flat audiometric curve. The earlier in gestation the mother contracted rubella the more severe the hearing loss. These Ss were responsive to early remedial intervention and wearable amplification. They were below normal in stature, body weight, and head circumference. All functioned mentally at or above age level compared to other deaf children when tested on the Nebraska Test of Learning Disabilities. (C. C. Berger)

5311. Flynn, John T. & Levine, Edna S. (U. Connecticut) **Analysis of contributing characteristics to effective interpretation for the deaf.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 635-636.—Attempted to empirically assess and identify the contributions of relevant personal attributes that relate significantly to effective interpretive skills for the deaf. This study will culminate in a prediction scheme that will enable training programs for potential interpreters to efficiently select candidates for such programs. A corollary purpose of the study is to identify traits and attributes that may prove common requirements for all service workers with the deaf and follow through aptitude and attribute studies in other disciplines, notably rehabilitation counseling.—*Author abstract*.

5312. Jackson, C. Wesley; Ellis, Rosemary; Hughey, George A., & Schlotfeldt, Rozella M. (Case Western U., Frances Payne Bolton School of Nursing) **Auditory deprivation: Stapedectomy patients who reported social change due to hearing impairment versus those who did not.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 637-638.—21 stapedectomy patients were clearly separated into 2 subgroups which did not differ on average hearing. "Social change" patients reported social deprivation associated with hearing impairment. They also were more hostile toward their ear conditions and described themselves as relatively more unhappy, stressful, sleepy, dizzy, friendly and neurotic than the "no social change" subgroup. The findings illustrate the differential effects of similar auditory impairment on patients' reported social stimulation. The mood and personality differences give additional significance to the

different social patterns and indicate the need to further investigate differential patterns of social stimulation associated with adult hearing impairment.—*Author abstract.*

5313. **Vernon, McCay.** (Western Maryland Coll.) **Potential, achievement, and rehabilitation in the deaf population.** *Rehabilitation Literature*, 1970(Sep), Vol. 31(9), 258-267.—Reviews research findings which indicate that deaf persons have essentially the same intelligence and manual dexterity that the hearing have. Although their work habits are good and they are stable in job tenure, their achievement in education, technical and professional employment, and psychosocial areas is unnecessarily low. Evidence is offered that this low achievement is primarily due to (a) inappropriate and inadequate education, vocational and technical training; and (b) inadequacies of counselling and job placement services. It is suggested that research is needed (a) to understand the gross failure of urban schools to serve the deaf; and (b) to remedy the inadequate preparation and use of the deaf at professional levels, especially in education, at the Bureau of Education of the Handicapped, and in rehabilitation. It is concluded that a continuation of present failures to develop the potential of deaf persons will result in mass unemployment. (56 ref.)—*Journal summary.*

SPEECH DISORDER

5314. **Bloodstein, Oliver.** (Brooklyn Coll., City U. New York) **Stuttering and normal nonfluency: A continuity hypothesis.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 30-39.—Reviewed research findings on specific behaviors associated with stuttering: part-word repetition, word repetition, sound prolongation, and forcing. The occurrence of these behaviors in children regarded as stutterers and non-stutterers was compared. It is concluded that (a) each of these behaviors is more common in the young stutterers, (b) each behavior occurs in discernible amounts in both groups, and (c) distribution in the speech sequence and conditions under which frequency varies has not been established. It is concluded that evidence is compatible with the view that these behaviors as found in the speech of both groups represent a continuum of the same thing. (17 ref.)—*S. Knapp.*

5315. **Carl, Sigrun.** (5 Anselm Feuerbach Platz, Freiburg/Breisgau, W. Germany) **Atemrhythmisierende Entspannungstherapie bei Sprechgestörten.** [Rhythmical respiration relaxation therapy of speech defect.] *Praxis der Psychotherapie*, 1969(Dec), Vol. 14(6), 256-260.—Presents a case of a 24-yr-old male student with a history of stammering since age 5. Conventional methods of speech therapy were ineffective. The therapeutic method developed by Marianne Fuchs was initiated on a weekly basis for 1½ yr. followed by less regular sessions which continued for another 6 mo. The method is based on rhythmical respirations which increase body awareness. The developing gains in body control and means of expression eliminated neurotic speech blockage. Relaxation therapy not only eliminated stammering, but effected the patient's emancipation from 5 women upon whom he was highly dependent. It improved self-esteem in his marriage and professional training.—*B. Stanton.*

5316. **Fawcus, Margaret.** (Kingdon-Ward School of Speech Therapy, London, England) **Intensive treat-**

ment and group therapy programme for the child and adult stammerer. *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 59-65.—Describes intensive group therapy programs for stammerers. Adult groups contain from 8-12 members, while smaller groups organized by ages are recommended for children. Each patient is interviewed and the severity, frequency, and type of stammer are rated. A questionnaire is completed for the patient's assessment of his speech problem, anticipated difficulty in 50 speech situations, previous treatment, and personal and family background. Treatment focuses on the modification of abnormal speech behavior by slow syllable-timed speech and block modification to establish a basic fluency level. Assignments on the elimination of speech avoidance, objective evaluation of audience reaction, and the scientific study of his own speech contribute to change in the patient's attitudes. Group therapy is considered to provide interpersonal relationships, realistic stress, and the opportunity for positive reinforcement. Results of the programs are considered promising.—*S. Knapp.*

5317. **Fransella, Fay.** (St. George's Hosp. Medical School, London, England) **Stuttering: Not a symptom but a way of life.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 22-29.—Describes a treatment program used on 17 men and 3 women, 17-49 yr. old, based on G. Kelly's personal construct theory. In this theory, stuttering is regarded as an essential part of the personality rather than a symptom. The aim of the treatment is to encourage the stutterer in the role of a fluent speaker and in experiments with fluency. The patient is asked to remember occasions when he spoke fluently or not as badly as he had expected and to describe the circumstances and events. The implications grid technique of D. N. Hinkle is the primary tool for therapy. This technique helps in the redirection of the stutterer's conception of himself in relation to speech. The patient is asked to describe photographs of people as the "sort of person people see me as being when I am stuttering" or not stuttering, and to consider and explain why he thinks certain characteristics describe him or he would like to describe him. Analyses of these grids, speed of speech, total disfluencies, and ratings of severity are made. Results of 2 yr. treatments of stutterers indicates the validity of this treatment program.—*S. Knapp.*

5318. **McCool, J.** (Ayrshire Child Guidance Center, Scotland) **Psychopathogenic non-fluency.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 16-21.—Reviews the results of an investigation to provide a basis for prognosis in stammering. The importance of causative factors of cognitive functioning and personality were assessed. Although cognitive functioning seemed to play a small part in stammering, the precise nature of this effect was not clear. The nature and adjustment of the personality as measured by a questionnaire seemed to play an important, but secondary role, "acting as a trigger mechanism or making the stammer resistant to therapy." It is concluded that these factors operate upon a basic neurological predisposition to stammer.—*S. Knapp.*

5319. **Neaves, Alison I.** (Ayrshire Child Guidance Service, Scotland) **To establish a basis for prognosis in stammering.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 46-58.—Compared 84 successfully and 81 unsuccessfully treated 8-17 yr. old stutterers. Tests of motor impairment and intelligence

and data gathered on birth and family histories indicate that (a) motor impairment, (b) a history of poor speech development, (c) stammering present at the beginning of speech, and (d) a family history of stammering, were significantly more in evidence in the unsuccessfully treated group. Ss indicating only 1 of the handicaps listed had an 80% chance of success in treatment, while Ss with 4 had only a 5% chance. The use of factors found to have secondary significance (intelligence and personality adjustment) or limited significance (lack of cerebral dominance, age, and social class) in determining prognosis is discussed. Evidence is considered to indicate that poor neuromuscular coordination is a causative factor in stuttering and that this is the result of heredity rather than brain damage. Implications for psychological and physiological theories and the treatment of stammering are discussed.—S. Knapp.

5320. Van Riper, C. (Western Michigan U.) **The use of DAF in stuttering therapy.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 40-45.—Reviews the research on delayed auditory feedback (DAF) and its utility in stuttering therapy. DAF is described as helping the stutterer to realize that other people can be made to stutter and that their responses to it are similar to their own. Further, DAF can teach the stutterer that his disfluency is modifiable and can be reduced, if not eliminated, in severity. Variations in delay intervals and volume for different Ss is discussed. Coping mechanisms are noted and the necessity of discouraging these established. It is suggested that stutterers pay too much attention to auditory and not enough to proprioceptive feedback and that DAF encourages the stutterer to remedy this situation. The use of DAF in conjunction with videotaping is discussed. (31 ref.)—S. Knapp.

5321. Wohl, Maud T. (Glasgow Speech Clinic, Scotland) **The treatment of non-fluent utterance: A behavioural approach.** *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 66-76.—Presents a treatment program for nonfluent speech based on the view that such speech "is a dysfunction which interferes with the normal process of language-embedding and with feedback experience and reinforcement." Detailed classification, assessment, and treatment plans are presented for festinate speech and stammering. Treatment of the 1st is concerned with the strict monitoring of speed and regularity. Stammering is additionally treated for specific types of blocking and ataxic behavior. "All for specific types of blocking and ataxic behavior. All training is mounted on the universals of language embedding. Education in using the electronic metronome to control speech... precedes the speaker's using the instrument in situations of graded degrees of difficulty. Where indicated, the residual psychological overlay of fear and apprehension are dealt with by a combination of Wolpeian reciprocal management and aversion-relief therapy."—S. Knapp.

NEUROLOGICAL DISORDER

5322. Lorranger, Armand W., et al. (Cornell U., Medical School) **Cognitive impairment in Parkinson's syndrome.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 463-464.—The WAIS was administered to 63 non-institutionalized parkinsonians. The majority or at the very least a large minority showed cognitive impairment large enough to be of both practical and theoretical

significance. There appeared to be a gradient ranging from a mild loss of a ability to retrieve and understand familiar verbal material, through an intermediate one in immediate memory and attention span, to a severe 1 in perceptual analysis and problem-solving. Neither all nor most of the impairment could be explained by the additive effects of depression, peripheral motor disability, and treatment with anticholinergic drugs.—*Author abstract.*

5323. Maiorchik, V. E. (Burdenko Inst of Neurosurgery, Moscow, USSR) **Zavisimost' stvolovyykh reaktsii ot funktsional'nogo sostoyaniya kory bol'shikh polusharij golovnogo mozga cheloveka.** [Brainstem reactions as a function of the functional state of the human cerebral cortex.] In S. P. Narikashvili (Ed.), "Korkovaya regulatsiya deyatelnosti podkorkovykh obrazovaniy golovnogo mozga." (See PA, Vol. 46: Issue 2) 81-93.—15 normal Ss and 50 patients with focal affections of the cortical structures participated in a study of the corticofugal regulation of the functions of the rhombencephalic divisions of the brain, utilizing synchronous recordings of a complex of electrophysiological and autonomic indices. Brainstem reactions, such as nystagmus and vascular tonus, were altered following signs of an increase in cortical excitation. A decrease in corticofugal control of brainstem reactions in cases of temporofrontal tumors led to a disturbed interaction between different reactions of the autonomic nervous system. An increase in respiratory periodicity in the rheoencephalogram and plethysmogram in normal Ss was manifested bilaterally when falling asleep in patients with brain tumors this effect was manifested excessively and more distinctly on the side contralateral to the site of the tumor. (English summary) (24 ref.)—D. London.

5324. Németh, Nóra. (Hungarian Academy of Sciences, Inst of Psychology Budapest) **A testséma-vilozás integrációs zavara agydaganatos gyermekbetegeknél.** [Lack of integration due to changes in the body-scheme in children suffering from brain tumor.] *Psychologiai Tanulmányok*, 1968, No. 11, 459-475.—Among the psychopathological characteristics of infantile brain tumors the absence of the awareness of illness is outstanding along with severe neural symptoms. Focal brain lesions manifesting themselves in the lack of integration of the complex functional systems, cannot be revealed with the help of the traditional diagnostic tools devised for the detection of the disturbances of consciousness. This may partly be responsible for the discrepancies in data concerning such disturbances in infantile brain tumors. It is interpreted as a sign of disturbed consciousness if, simultaneously with a disturbance in the sensorimotor functioning, there occurs some lack of body-scheme integration without the child noticing it. Body-scheme change cannot be made explicit in children by means of verbal responses, but when graphically projected it appears on the same side as the clinical symptom. The human figure drawings of such children are their somatic self portraits. They may be evaluated as the graphic projections of the infantile organic psychosyndrome—disturbed consciousness—and appear to be helpful in revealing the complex functional integrational disturbances of thought processes associated with body-scheme changes and anosognosia. (Russian summary) (64 ref.)—English summary.

5325. Pinelli, Paolo. (Catholic U. of the Sacred Heart, Rome, Italy) **Considerazioni sulle ipercinesie da L.**

dopa: Significato del deficit biochimico e del deficit anatomico. [Considerations on hyperkinetic behavior from L-dopa: Significance of biochemical and anatomic deficits.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Sep), Vol. 31(5), 405-416.—EMG follow-ups of parkinsonism treated with L-dopa suggest that: (a) a kinetic hypertonic syndrome derives from a functional disturbance of operating neuronal cell assemblies; (b) hereditary and acquired assemblies are located in hierarchically different levels of the CNS; (c) a fall in the dopamine level enhances activity of the central pool and as a consequence rigidity together with akinesia results; and (d) cellular impoverishment in the inhibitory system hinders modulation of the central pool, even if substitutive therapy with dopamine is affected.—*L. L'Abate*.

5326. **Rosenstock, Harvey A. Alzheimer's presenile dementia: A review of 11 clinically diagnosed cases.** *Diseases of the Nervous System*, 1970(Dec), Vol. 31(12), 826-829.—Reviews the early course of 11 patients with clinically diagnosed Alzheimer's disease. Principle findings indicate that (a) Alzheimer's presenile dementia is distinguishable clinically from other idiopathic dementias of the presenium. (b) There is a predictable course of early amnesia, disorientation, confusion, apraxia, and impaired perceptual organization. (c) Depression and other psychiatric symptoms are not uncommon in the early stages of the illness. (d) EEG changes occur early and include diffuse slowing and loss of the dominant alpha rhythm. The pneumoencephalogram may reveal generalized cortical atrophy and/or ventricular dilatation. (e) The early occurrence of confabulation, focal neurologic deficits, incontinence, muscular atrophy, and convulsions would suggest a disorder other than Alzheimer's disease.—*Journal summary*.

Brain Damage

5327. **Bell, D. Bruce; Lewis, Franklin D., Diller, Leonard, & Bell, Beverly W.** (Social Security Administration, Washington, D.C.) **The puzzling imperistence of the Motor Imperistence Test.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 623-624.—The Motor Imperistence Test was administered to 17 Ss who had residual paralysis on the left side of the body following cerebrovascular accidents. The reliability of the rankings of the total scores obtained by these Ss over a 60-day period with the same Es and over a shorter period with different Es was somewhat compromised by the lack of consistency in the performance of individuals and across items. The major problem with this test was a lack of homogeneity which was improved by omitting certain items. Other methodological and theoretical implications of the test are also discussed.—*Author abstract*.

5328. **Gainotti, Guido.** (U. Perugia, Clinic of Nervous & Mental Diseases, Italy) **Deterioramento intellettivo e distintegrazione psico-motrice nelle demenze.** [Intellectual deterioration and psychomotor disintegration in mental disorders.] *Acta Neurologica*, 1970(Sep), Vol. 25(5), 607-627.—Studied 32 randomly selected hospitalized patients with symptoms of mental disorders of various kinds and due to diffuse brain lesions for relationship between loss of intellectual efficiency and motor disintegration. Verbal and nonverbal tests sensitive to deterioration (Wechsler-Bellevue's Arithmetic and Block Design subtests and Rey's "15 words" and "Complex Figure" tests) were administered for evalu-

ation of loss of intellectual efficiency. Signs of motor disintegration were explored by standardized examinations of various motor activities. On the basis of results of intellectual efficiency tests, patients were divided into 3 groups corresponding to initial, progressive, and complete stages of deterioration. Data showed a clear-cut relationship between intellectual deterioration and psychomotor disintegration. A rigid order of appearance of various signs could not be indicated but approximations are suggested as to time and degree of occurrence. (English summary) (18 ref.)—*M. J. Stanford*

5329. **Gainotti, Guido.** (U. Perugia, Clinic of Nervous & Mental Disorders, Italy) **Il comportamento emozionale dei cerebrolesi destri e sinistri in situazione di test neuropsicologico.** [Emotional behavior in right- and left-sided brain-damaged patients in neuropsychological testing situations.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1970(Sep), Vol. 31(5), 457-480.—Left-sided brain-damaged patients tended to show a clear prevalence of catastrophic reactions, anxiety, depression, or anger and abandonment of the task. Right-sided brain-damaged patients reacted by indifference, tendency to joke, anosognosia, belittlement, and denial of handicap. Different patterns of denial of illness stem from the functional organization of each side of the brain.—*L. L'Abate*.

5330. **L'Abate, Luciano & Gale, Elliot N.** (Georgia State Coll.) **Neurological status and psychological functioning.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 999-1007.—To match psychological test results and reports with neurological status, 2 studies involving different patient samples were conducted. Intellectual functioning, visual reproduction, speed, and ability to abstract were compared for 2 groups of neurological (N = 16) and control (N = 12) Ss from a city hospital. In this sample, a "blind" global matching of psychological test results and neurological status was correct 65% of the time. With similar information for Ss from a private psychiatric hospital (26 brain-damaged patients, 20 equivocal brain-damaged patients, and 25 non-brain-damaged controls), the same matching was 66% correct. Significant relationships between neurological status and psychological test results are discussed. (15 ref.)—*Journal abstract*.

5331. **Lantosyné-Dabas, Erzsébet & Éderváriné-Kovács, Ilona.** (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A nevelési és környezeti tényezők szerepe a gyermekkori koponyatraumák okozta személyiségváltozásban.** [Role of educational and environmental factors in personality changes due to cranial traumas.] *Pszichologiai Tanulmányok*, 1968, No. 11, 443-457.—Examined the environment and education preceding cranial trauma in 50 children. On the basis of data obtained, educational environments were divided into Group A, in which educational influence was found to be negative, and into Group B, in which it was positive. In the pretrauma period complaints were present in 54% of the cases in Group A, and only in 8% of the cases in Group B; after the trauma this percentage rose to 73 in Group A and 42 in Group B. In Group A complaints following the trauma represented mostly intensification of behavioral difficulties existing already in the pretrauma period; in Group B neurovegetative and more severe organic lesions were complained about. Although intelligence level of the 2 groups was found to be about the same, their school achievements differed to a great extent: 54% of Group A and only 13% of Group

B were underachieving at school. This difference was supported by the qualitative differences observed in the course of psychological tests including various tasks. Group A Ss were rather moody, impatient, and demanded support, while the work of Group B Ss was characterized by discipline, patience, and a compensatory mood. Findings suggest that the effect of the cranial trauma is in many instances only secondary, and may be attributed to injuries incurred in the premorbid educational period. (Russian summary) (19 ref.)—*English summary*.

5332. Lempp, Reinhart. (U. Tübingen) *Frühkindliche Hirnschädigung und spätere neurotische Entwicklung*. [Cerebral lesion of early childhood and later neurotic development.] *Praxis der Psychotherapie*, 1969(Dec), Vol. 14(6), 274-281.—Describes the "exogenous psychosyndrome" occurring in early childhood in 500 Ss who experienced minimal brain damage. Mild cerebral palsy produced developmental lag in abilities to differentiate between figure and background and acoustical perception. Behavioral symptoms of agitation, flattening of affect, hypersensitivity, and antisocial conduct were characteristic. Investigation of the family environment indicated that while the child-parent relationship might initially have remained intact, it was likely to become dissociated through parental use of excessive negative reinforcement. Neurosis was the most frequent outcome.—B. Stanton.

5333. Ormai, Vera; Kalmár, Magda; Grozdits, Zsuzsa H., & Fabricius, Ildikó. (Eötvös Lóránd U., Budapest, Hungary) *Adatok az agysérült gyermekek pszichológiai vizsgálatának metodikájához*. [Data on methods used in the psychological examination of children with cerebral lesions.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 387-421.—Reports results reached by brain-injured children in the Bender pattern copying test (rated according to H. Santucci and N. Galifret), a variation of the Kohs Mosaic Test, and the Draw-a-Man Test. A good solution of the 3 tests infers intact visual perception and sensorimotor coordination, disorders observed frequently after organic brain injuries. The data of 5-11 yr. old normal children (25 in each age group) are quoted. Correlation between tasks—assumed on the basis of similar function values—was verified in every age group (significance varied between $p < .02$ – $p < .001$). Traits in the development of normal Ss were compared with the results of 25 8-11 yr. old epileptic but not mentally backward primary school children. The epileptics were found to have obtained significantly lower results, especially in the synthesis of spatial relations. In Ss born prematurely, retarded neuromotor development was found. In the Ss complicated at birth with asphyxia, visual perception as well as motor development were impaired. Results prove that the methods may be useful in the psychological testing of children with cerebral lesions. They not only provide an opportunity for quantitative and qualitative analysis, but also for observing the child's activity and thus detecting the factors bringing about failure. (Russian summary) (3 p. ref.)—*English summary*.

5334. Reed, James C. & Reitan, Ralph M. (Tufts U., Medical School) *Verbal and performance differences among brain-injured children with lateralized motor deficits*. *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 747-752. Children diagnosed as infantile hemiplegias were classified into groups by side of motor deficit. 35 Ss had right hemiplegia and 25 had left

hemiplegia. Each S was administered the WISC and the reading section of the Wide Range Achievement Test. No relation was found between side of deficit and Verbal Performance difference scores. In each group WISC Performance IQ was lower than WISC Verbal IQ. There was no significant difference in reading achievement. Relationships between intelligence test pattern and side of deficit reported for brain-injured adults do not appear to hold for children.—*Journal abstract*.

5335. Russell, Elbert W. (Veterans Administration Hosp., Cincinnati, O.) *A reexamination of Halstead's biological intelligence factors*. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 461-462.—The 4 factors in W. C. Halstead's concept of biological intelligence were derived from a factor analysis by Thurstone of Halstead's tests for brain damage. The major tests in his analysis were matched with results from 66 chronic brain-damaged Ss and a factor analysis was performed. Only 1 of the 4 resulting factors was similar to any of Halstead's factors. Instead, the factors represented performance, verbal, pure motor speed, and verbal attention variables.—*Author abstract*.

Epilepsy

5336. Ferson, Jean. (Temple U., Medical School) *The "monster complex" in children who have seizures*. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 625-626.—The title refers to a syndrome observed by the author in the course of her routine diagnostic work with handicapped children. 11 cases are described, 7 girls and 4 boys 3-14 yr. of age. They are called "monsters" because they were nearly unmanageable and showed little or no conscience development. A psychological explanation is offered in which the epileptic seizures are seen as disrupting the normal parent-child "contract"; i.e., parents tacitly agree to control and protect the child and the child agrees to be controlled. When the seizure occurs, doubt is cast on the ability of each party to fulfill his or her side of the agreement. A period of testing and uncertainty begins which can culminate in "the monster complex." Group counseling for parents is recommended as a means of avoiding its development.—*Author abstract*.

5337. Ives, Lawrence A. (U. Manchester, England) *Learning difficulties in children with epilepsy*. *British Journal of Disorders of Communication*, 1970(Apr), Vol. 5(1), 77-84.—Reviews research and findings on epileptic children in the areas of (a) intelligence, (b) perceptual-motor difficulties, (c) psychological testing, (d) intellectual faculties, (e) personality and behavior, (f) hyperactivity in brain-damaged epileptic children, and (g) stammering. The research and techniques are evaluated and suggestions are made for future investigations with emphasis on longitudinal studies of medical, educational, psychological, social, and economic variables. MENTAL RETARDATION

5338. Anderman, S., Barclay, A., Kahana, B., & Yater, A. (St. Louis U.) *Intelligence and serum phenylalanine in levels in phenylketonuric children*. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 613-

614.—Examined the effect of located phenylketonuria (PKU) on the human child. The case histories of 16 boys and 9 girls who had been identified as PKU, and started on the dietary treatment within the 1st 2 mo. of life provided data for a number of variables. The effects of serum phenylalanine upon cognitive development, behavior, and physical development were investigated. Furthermore, an analysis of the contribution of non-treatment factors such as sociodemographic and sex variables was also completed. Results of a correlational analysis indicate that the 2 most significant predictors of the cognitive criterion were current serum phenylalanine levels and socioeconomic level of the family. Furthermore, sex differences in significantly lower IQ and significantly higher current levels of serum phenylalanine with boys, as well as significantly poorer parental dietary control with boys were also noted.—*Author abstract.*

5339. Barton, Elizabeth S. (Meanwood Park Hosp., Leeds, England) **Inappropriate speech in a severely retarded child: A case study in language conditioning and generalization.** *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 299-307.—The modification of inappropriate speech, a class of behaviors rather than a limited number of specific examples, is little known in the severely retarded. In this study, operant techniques were used to modify the strikingly bizarre and inappropriate speech of an 11-yr-old severely retarded boy. S's appropriate verbal responses to questions about magazine pictures were reinforced with candy. When he responded inappropriately, the magazine was withdrawn, and social interaction was discontinued for a 10-sec time-out period. Negative responses were ignored, the next picture displayed, and the next question asked immediately. In 10 sessions, appropriate responses increased from 26-86% of all responses. A reversal of reinforcement was then introduced, in which inappropriate responses were reinforced, appropriate responses resulted in time out, and negative responses were treated as before. This reduced the percentage of appropriate responses to 24%. Subsequent sessions of reinforcement for appropriate responses increased appropriate responses to 96% of all responses. At significant stages in the experiment, a measure of possible generalization was attempted. Although some generalization was recorded, it was minimal: some explanations are discussed.—*Journal abstract.*

5340. Bódor, Jenő. **Az értelmi fogyatékos gyermekek pszichológiai fejlődésének vizsgálata a Szovjet kutatók munkáiban.** [Soviet studies concerned with the development of mentally defective children.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 477-486.—Reports the following basic principles applied by Soviet researchers to the psychology of mental retardation: (a) leading part played in development by training and instructing, (b) complex structure of anomalous development, (c) determinism regarding factors of anomalous development, and (d) nearness of zones of development. The analysis of Soviet research in this field proved that success has been due to the dialectic materialistic interpretation of development and to an adequate consideration for the above basic principles, setting an example for future investigations. (Russian summary) (18 ref.)—*English summary.*

5341. Bradley, Betty H. (Columbus State Inst., O.) **The use of the playroom in education of mentally retarded children.** *Rehabilitation Literature*, 1970(Apr), Vol. 31(4), 103-106.—Describes playroom techniques

applied to specific educational problems on the basis of 10 yr. of work with mentally retarded children at the Columbus State Institute. Major benefits claimed are the areas of improved communication with staff members, specific remediation on educational behavioral difficulties, and a decrease in fragmentation of services to institutionalized children.—S. L. Warren.

5342. Bramza, Anthony F., Witt, Peter A., Linford, Anthony G., & Jeanrenaud, Claudine. (U. Illinois Children's Research Center) **Responses of mongoloid children to colored block presentation.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 1008. Examined the responses of 5 male and 6 female, 66-95 mo. old mongoloid children presented with the same colored blocks used in a previous study by A. F. Gramza and P. A. Witt (see PA, Vol. 46:Issue 3). Comparative data was provided on the effect of color on block choices and the nature of block play in mongoloid Ss. P. Hertzberg.

5343. Brolin, Donn & Wright, George N. (Stout State U.) **Implementing rehabilitation recommendations for the mentally retarded.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 586-592. Attempted to determine the extent to which 5 types of recommendations from an evaluation center for the retarded were implemented and variables related to their implementation. Data on 229 former outpatients of a diagnostic center, mostly noninstitutionalized, ranging in CA from 15-51 yr. and in IQ from 40-89, were obtained from a follow-up questionnaire and evaluation center records. Caseworkers reported on the extent to which recommendations were followed, and related the influence of 17 variables in implementing different types of recommendations (i.e., social, medical, psychological, vocational, and educational). Statistical procedures used to analyze the data at $p < .05$ were chi-square, Pearson product-moment correlation, and the stepwise multiple regression analysis. Findings indicate that the influence of different variables on the implementation of recommendations varies according to the type of recommendation and sex of the client. Importance of the family was found to be particularly related to the client's rehabilitation.—*Journal abstract.*

5344. Buday, József. (City School-Health Center Budapest, Hungary) **Összehasonlító fáradékonysági vizsgálatok Down-beteg gyermekeknél ózontartalmú levegő hatására.** [Comparative examinations of fatigue in children suffering from Down's syndrome, when treated with air containing ozone.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(2), 263-271.—Treatment of classroom and dormitory air with ozone resulted in decreased fatigue of 13-14 yr. old children suffering from Down's syndrome. (English & Russian summaries) M. Mende.

5345. Flanigan, Patrick J., Peters, Carlotta J., & Conry, Julianne L. (U. Wisconsin) **Item analysis of the Children's Manifest Anxiety Scale with the retarded.** *Journal of Educational Research*, 1969(Jul), Vol. 62(4), 472-477.—Examined the usefulness of the CMA scale with a retarded population. Item analysis of scores earned by 16 male randomly assigned retarded and 19 normal Ss indicates that the stimulus items function differentially between groups regarding their ability to discriminate high and low anxiety. (20 ref.) *Journal abstract.*

5346. Friedrich, Douglas; Fuller, Gerald B., & Hawkins, William F. (Central Michigan U.) **Relationship between perception (input) and execution (output).** *Perceptual & Motor Skills*, 1969(Dec), Vol.

29(3), 923-934.—15 brain-damaged and 9 non-brain-damaged retarded Ss were given the following visual-motor tasks: (a) the WISC Block Design subtest, (b) the WISC Block Design multiple-choice procedure presented by H. G. Birch, et al., and (c) the Minnesota Percepto-Diagnostic test circle-diamond figures, incorporating pencil and block procedures. A combination of the Block Design subtest and the circle-diamond figures was successful in indicating Ss with execution (motor) or integrative dysfunctions. The multiple-choice procedure proved invalid as a technique for differentiating Ss with executive or integrative dysfunctions from Ss with visual perceptual difficulties. Results argue against the commonly held notion that perception is a unitary process. Rather, the findings suggest that failures on visual-motor tasks by mentally retarded Ss result primarily from faulty executive or integrative components. (21 ref.)—*Journal abstract*

5347. Fuller, Renée & Shuman, Joyce. (Rosewood State Hosp., Owings Mills, Md.) Treated phenylketonuria: Intelligence and blood phenylalanine levels. *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 539-545.—Analysis of 113 phenylketonurics (age range = a few days to 5 1/2 yr.) on treatment with a low phenylalanine diet showed: (a) a decrease in performance on tests of intelligence in Ss younger than 18 mo. when blood phenylalanine levels were below 5 mg/100 ml, raising the question of whether phenylalanine needs of phenylketonuric infants are greater than normal infants and older children, (b) dietary regimens producing phenylalanine levels above 5 mg/100 ml were not followed by a decrease in IQ; and (c) discontinuation of dietary treatment was more deleterious to the IQ of those Ss whose phenylalanine intake had been more limited (blood phenylalanine level less than 9 mg/100 ml) in the year immediately prior to discontinuation than in those Ss kept on more liberal intake (phenylalanine greater than 9 mg/100 ml). (35 ref.)—*Journal abstract*

5348. Graham, James T. & Graham, Louella W. (University of) Language behavior of the mentally retarded: Syntactic characteristics. *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 623-629.—Language samples from 9 mentally retarded Ss with CAs ranging from 10-18 yr. and MAs ranging from 3-6-10 yr. were analyzed syntactically. Results indicate that certain indices of linguistic sophistication and Ss' MAs were correlated. It was tentatively hypothesized that nonmongoloid retardates develop rules of their language at a different rate but in much the same way as intellectually-average children.—*Journal abstract*

5349. Greene, Elaine G. (U. Alabama) A comparative study of perceptions of parents toward their mentally retarded children. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7A), 3392.

5350. Irle, Gerhard. Die Gesellschaft und der Schwachsinnige. [Society and the feebleminded.] *Praxis der Psychotherapie*, 1969(Dec), Vol. 14(6), 245-255. Reviews literary descriptions of the role of the mental defective in society utilizing comparisons of character descriptions from Faulkner, Dostoevsky, and Pearl S. Buck. The role of the mental defective has not changed appreciably. There are few opportunities for and little interest in the integration of the mental defective into society. It is pointed out that individuals having minor degrees of mental retardation encounter greater difficulties than those who are severely handi-

capped. The individual having a mild degree of mental retardation frequently does not have the benefit of special schools nor is he granted acceptance of his disability by society. As a consequence, he faces increased pressures to perform, frequently accompanied by parental and peer mockery. (14 ref.)—*Journal abstract*

5351. Kohnenber, Robert J. (Washington) The punishment of persistent vomiting. A case study. *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 241-245. In an attempt to control severe vomiting in a severely mentally retarded 21-yr-old female, shock was delivered after each stomach tension, a preeminent response that consisted of an overt abdominal movement. Contingent shock resulted in an initial temporary increase followed by a decrease in rate of stomach tensions. There was a decrease in emitted vomitus which resulted in a weight gain of the patient.—*Journal abstract*

5352. McKay, Dorothy. An examination of the differences between the paintings and figure drawings of a group of institutionalized mentally retarded children and a group of "family-reared" mentally retarded children. *Australian Occupational Therapy Journal*, 1970(Jan), Vol. 17(1), 13-24. Selected 9 institutionalized and 9 family-reared mentally retarded children with MAs of 4-6 yr. and CAs of 7-19 yr. Ss were given 8 crayons of differing colors and asked to draw themselves and then another person on a large piece of paper. Ss were then given another piece of paper and 8 liquid poster colors with which to paint a picture of their choosing. Productions were analyzed by area covered, height of figures, paper used, colors used, numbers of human figures, and the Goodenough-Harris Drawing Test. Institutionalized Ss used significantly more paper, while family-reared Ss indicated significantly better body irregularity and more human figures in their spontaneous paintings. Significant and non-significant results were all in the expected direction indicating that the institutionalized Ss had experienced sensory deprivation, had less creative control, and less opinions of themselves, had greater amounts of emotional disturbance, and had little interest in other human beings. It is concluded that human figure drawings and paintings are valid methods of assessing institutionalized perceptual and maternal deprivation. (26 ref.)—*Author*

5353. Nihira, Kazuo. (U. California Neuropsychiatric Inst., Los Angeles) Environmental expectations and adaptive behavior. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 66(Pt. 2), 619-620. Descriptions of retardates coping problems were obtained by means of the common resident technique in 8 institutional settings, residential institutions, private centers, and special education centers. Results indicate that a shift of environment from residential to community was accompanied by a decrease in reported incidents involving self-help skills and an increase in those involving community interactions. Results were interpreted in terms of 1) differences in the retardates' actual behavior patterns and 2) differences in environmental demands and expectations between settings. The study yielded descriptions of behavioral demands largely neglected by the standard instruments designed to measure degrees of retardation.—*Author abstract*

5354. Owens, David, Dawson, James C. & Levin, Sheldon. (Continuing Medical Health Services, San Diego, Calif.) Alzheimer's disease in Down's syn-

drome. *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 606-612.—Although neuro-pathologists describe Alzheimer's changes in the brains of all victims of Down's syndrome over 35 yr. of age, only 3 cases of clinical dementia in such individuals are described in the literature. In order to establish clinical correlates of Alzheimer's disease, psychiatric and neurologic findings obtained from a middle-aged group were compared to those of Down's syndrome patients in their early 20s. The older group exhibited significantly greater incidence of abnormality in (a) object identification, (b) snout reflex, (c) Babinski sign, and (d) palmomental sign. Both groups displayed mild hypertonia rather than hypotonia, and face-hand test was abnormal in 75% of Ss tested. While dementia is uncommon, subtle neurological changes reflect neuropathological findings present in aging sufferers of Down's syndrome. (17 ref.)—*Journal abstract.*

5355. Paul, Howard A. & Miller, Joel R. (Pennsauken Schools, N.J.) **Reduction of extreme deviant behaviors in a severely**, 1971(Feb), Vol. 67(4), 193-197.—A 12.5-yr-old girl with a MA of 2.11 yr. who displayed many negative behaviors, e.g., hand biting, chin hitting, disrobing, smearing feces, breaking objects, spitting, etc., was given a treatment program using behavior modification techniques. A combination of reinforcing positive behaviors and using a time out procedure was effective in reducing the deviant behaviors and in shaping more adaptive behaviors. 20 therapy sessions conducted over a 2-mo period, were sufficient to produce noticeable changes in behavior. Carry over was reported by personnel in cottage and school areas.—*Journal abstract.*

5356. Payne, James S. (U. Virginia) **Prevalence survey of severely mentally retarded in Wyandotte County, Kansas.** *Training School Bulletin*, 1971(Feb), Vol. 67(4), 220-227.—Conducted a prevalence survey in Wyandotte County, Kansas to determine the extent of severe mental retardation. Severely mentally retarded individuals were defined as persons whose IQs were 50 and below. The prevalence and incidence rates of this study were compared with similar studies and results indicate a somewhat higher rate of incidence of severely mentally retarded in Wyandotte County. (16 ref.)—*Journal abstract.*

5357. Rundle, A. T. & Atkin, Julia. (St. Lawrence's Hosp., Caterham, England) **Serum alkaline phosphatase isoenzymes in Down's syndrome.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 613-616.—Starch gel electrophoresis was used to investigate the serum alkaline phosphatases in 75 cases of Down's syndrome. Of these, 51 cases were found to be of the genetic variety Pp 1, i.e., with a single band of activity; 17 cases were found to be of the Pp 2 form, with an additional band of activity of intestinal origin; 1 case was found with a 3rd band which is tentatively suggested to be the rare normal variant C; and 6 cases were shown to have a slow-running band of activity in the β -lipoprotein region which may also be normal variants. These findings are discussed with particular reference to gene location on the 21st chromosome. (27 ref.)—*Journal abstract.*

5358. Turnure, James E. (U. Minnesota, Inst. of Child Development) **Distractibility in the mentally retarded: Negative evidence for an orienting inadequacy.** *Exceptional Children*, 1970(Nov), Vol. 37(3), 181-186.—Describes 3 studies in which the orienting behavior of

normal and mentally retarded children was investigated under a variety of conditions. An initial study found that, in many cases, normal Ss showed nontask orientations to a greater extent than did retarded Ss. An examination of those circumstances wherein the retarded had been found to glance more indicates that such circumstances, often observed in the classroom, are inappropriate for adjudging retarded children to be distractible. Further research involving only retarded Ss shows that the inclusion of an adult in the learning situation greatly increased retarded Ss' nontask orientations. However, it was also shown that if cues were provided by the adult they would be utilized by the Ss; the retarded Ss glancing apparently represented information seeking and not merely vacuous orientations to a salient social stimulus. A new conception of children's attending behaviors is suggested to account for the findings.—*Journal abstract.*

5359. Valletutti, Peter. (Coppin State Coll.) **Language of the mildly mentally retarded: Cognitive deficit or cultural difference?** *Exceptional Children*, 1971(Feb), Vol. 37(6), 455-459.—Discusses the problem of stereotypic judgments which relate socioeconomic status to speech and language patterns. An evaluation of language is proposed which alternates between the opposing conservative and liberal perspectives on speech defects. "It supports a view which assigns educational priority to the cognitive function of language and assigns a minor role to social acceptability." (35 ref.)—P. Hertzberg.

Learning & Motor Ability

5360. Anders, Terry R. (Harvard Medical School, Boston, Mass.) **Short-term memory for serially presented supraspan information in nonretarded and mentally retarded individuals.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 571-578.—Attempted to test Ellis' hypothesis that mental retardates exhibit a short-term memory deficit as a result of their failure to employ rehearsal and other mnemonic devices generally used by intellectually-average individuals. Nonretarded (mean age = 19.3 yr.) and mentally retarded (mean age = 21.6 yr.) Ss were compared on a task which required partial recall of serially presented supraspan lists of letters following filled and unfilled delays of 0, 5, 10, and 20 sec. As predicted, the results showed that filling the retention interval with rehearsal-preventing activity has a far more detrimental effect upon the short-term memory of intellectually-average individuals than on the short-term memory of retardates. These results are consistent with Ellis' account of the short-term memory deficit of mental retardates.—*Journal abstract.*

5361. Bricker, William A. & Bricker, Diane D. (George Peabody Coll. for Teachers, John F. Kennedy Center) **Receptive vocabulary as a factor in the discrimination performance of low-functioning children.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 599-605. 3 groups of low-functioning children—1 receiving name training, 1 receiving no name discrimination training, and the 3rd receiving no training—were compared on a series of discrimination problems to determine the effects of denotative naming. A pretest, intervention, posttest design was used with random assignment of 30 institutionalized retardates to the 3 conditions. In Treatment 1, the color-form stimulus name served as a cue for choice; in Treatment 2,

problem presentation occurred without naming; in Treatment 3, no intervening training was given. Although the training groups did not differ significantly on training and posttesting, both groups showed reliable improvement across training blocks and performed significantly better on the posttest than did the control Ss. Generalization testing also revealed a statistically reliable difference in favor of the trained groups.—*Journal abstract.*

5362. Guess, Doug; Smith, James O., & Ensminger, Eugene. (Kansas Neurological Inst., Topeka) **The role of nonprofessional persons in teaching language skills to mentally retarded children.** *Exceptional Children*, 1971(Feb), Vol. 37(6), 447-453.—Reviews a 2-yr research project in which 2 former psychiatric aides were trained to serve as language developmentists for small groups of institutionalized severely retarded children. 40 Ss participating in the program were compared with a matched control group on variables of IQ, language, age, and social quotient. Ss attending language classes met daily for approximately 1 hr. They were taught from the Peabody Language Development Kits and a series of lessons developed during the project. Results show significantly greater language scores made by the language training group. IQ score increases were equivocal, but again favored those Ss attending language classes.—*Journal abstract.*

5363. Hall, Judy E. (U. Alabama, Center for Developmental & Learning Disorders, Birmingham) **Effect of response bias of mental retardates upon oddity learning.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 579-585.—64 mental retardates were assessed for a bias to respond to form, color, or size. Each S was then tested on oddity learning with either form or color odd. There were 4 groups: FF, FC, and CC, and CF (the 1st letter indicating dimensional bias; the 2nd, odd dimension). $\frac{1}{2}$ of each group were high MA (8-10 yr., approximately) and $\frac{1}{2}$ were low MA (6-8 yr., approximately). After the 64 oddity trials, each S was reassessed for bias. Ss tested on oddity with their bias dimension odd (FF and CC) performed significantly better ($p < .0009$) than Ss tested with their nonbias dimension odd (FC and CF). When the individual biases of each S were controlled, oddity learning did not increase with MA. Biases were found to be remarkably strong and resistant to change. Results were interpreted as consistent with Zeaman and House's analysis of oddity learning. (20 ref.)—*Journal abstract.*

5364. Johnson, John T., & Olley, J. Gregory. (Memphis State U.) **Behavioral comparisons of mongoloid and nonmongoloid retarded persons: A review.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 546-559.—In an effort to provide information concerning the utility of the American Association on Mental Deficiency's medical classification system for psychology, a review is made of the literature that has compared mongoloid and non-mongoloid retarded Ss on behavioral tasks. The studies reviewed are grouped into the areas of (a) mental abilities, (b) sensory processes, (c) learning and conditioning, and (d) RT and activation. While there appeared to be more similarities than differences between mongoloid and nonmongoloid retarded Ss, several problems are discussed which prohibit firm conclusions. Suggestions are made concerning the elaboration of a viable behavioral classification system for mental retardation. (27 ref.)—*Journal abstract.*

5365. Martin, Clessen J., & Herndon, Mary A. (Texas A & M U., Human Learning Research Lab.) **Influence of memory strategies upon the learning of new words among educable retarded children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 617-618.—Attempted to determine whether E-supplied memory strategies could facilitate word recognition learning among educable retarded children. 3 groups were formed. The syntactical group received memory strategies during the word recognition task. The word formation group was given cue word training. The repetition group was instructed to repeat the words during the word recognition task. Relearning trials were administered 48 hr. after the word recognition task. While there were no significant differences in mean correct responses during acquisition, there were significant differences during relearning in favor of the syntactical group.—*Author abstract.*

5366. Meindl, Joseph L., Barclay, Allan G., Lamp, Robert E., & Yater, Allan C. (Indiana U., South Bend) **Mental growth in noninstitutionalized mongoloid children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 621-622.—Compared a mental growth curve for non-institutionalized mongoloid children with those curves presented for institutionalized mongoloid patients. While arguments have been advanced for the intellectual and social superiority of home-rearing as opposed to institutional rearing for mongoloid retardates, studies concerning mental growth curves for mongoloid children have been limited largely to institutionalized populations. Ss were drawn from the outpatient register of a child development clinic and a residential school for exceptional children. Marked differences in mental growth after age 9 yr were noted between the curves presented for institutionalized and noninstitutionalized Ss.—*Author abstract.*

5367. Redd, William H. (Massachusetts General Hosp., Boston) **Effects of reinforcement contingencies on attention span and task related stimulus control in retarded children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 671-672.—During training with an adult, 3 retarded boys were presented 3 tasks, each associated with a different training regime (extinction, contingent, or noncontingent reinforcement). The contingent task acquired discriminative properties, whereas other tasks did not. Control was maintained in familiar and unfamiliar settings and with novel adults. When the contingent task was introduced following the presentation of extinction and noncontingent tasks, Ss manipulated the contingent task, when the other 2 tasks were presented after the contingent task, Ss ignored them and continued working on the contingent task. Results were replicated when assignments of reinforcement contingencies to tasks were removed.—*Author abstract.*

5368. Sajwaj, Thomas & Hedges, Donald. (U. Mississippi, Medical Center) **Functions of parental attention in an oppositional, retarded boy.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 697-698.—2 experiments analyzed the interaction of punishment and positive reinforcement. Contingent parental attention could not maintain cleanup behavior in a retarded oppositional boy. When a blast from a bicycle horn was used to eliminate disruptions, cleanup increased greatly. How-

ever, praise was now necessary to maintain the high level of cleaning. Furthermore, the praise had to come from the parent using the horn. These results suggest that the horn prompted the child to look more to a parent, thus attending to the parent's praise. Exp. III demonstrated a transient punishment effect of praise. This suggests that a response-consequence linkage may have discriminative functions.—*Author abstract.*

5369. Twardosz, Sandra & Sajwaj, Thomas. (U. Kansas) **Development of complex sentence structure in a retarded girl using a multiple baseline technique.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 663-664.—Multiple base-line techniques were used to demonstrate that prompts and differential positive reinforcement (praise and tokens) increased complex language in a retarded girl. These procedures were extremely effective when used by her preschool teacher. However, these same procedures, when used by the child's mother with comparable accuracy were considerably less effective. Reversals showed that the teacher's praise alone could maintain the complex speech as effectively as praise and tokens together. The differential effectiveness of the mother and teacher may be ascribed to subtle differences in praising or to possible differences in the child's reinforcement history with these individuals.—*Author abstract.*

Training & Vocational Rehabilitation

5370. Brown, Lou; Johnson, Sylvester, & Fenrick, Nancy. (U. Wisconsin) **Increasing individual and assembly line production rates of retarded students.** *Training School Bulletin*, 1971(Feb), Vol. 67(4), 206-213.—Work arrangements (individual and assembly line) and reinforcement (social only and social plus tangible) were manipulated to increase the production rates of 6 trainable level students, 15-20 yr. old, in an envelope stuffing task. Individual work settings consistently resulted in higher production rates than assembly line settings regardless of the reinforcement contingencies in effect. Production rates also consistently improved when tangible reinforcement in the form of components of a "banana split" was successively made contingent on attaining a student or group specified goal. These environmental manipulations were successful in part because the teachers specified their instructional objectives in a way that required direct measurement of their Ss' behavior.—*Journal abstract.*

5371. Cowden, Kenneth. (Dewitt State Hosp., Auburn, Calif.) **The mentally retarded can contribute.** *Hospital & Community Psychiatry*, 1969(Dec), Vol. 20(12), 395.—Describes the use of 19 mentally retarded patients (average IQ = 41) as harvesters of tomatoes when local farmers faced losses due to the unavailability of workers. Patients harvested up to 75% as much as nonpatients, but were better at selecting usable tomatoes. Patients improved in color perception, coordination, and size judgments. Patients were prompt and demonstrated good work habits. Earning money led to feelings of accomplishment and enhanced self-esteem.—*S. Knapp.*

5372. Etienne, Jerald & Morlock, David A. (Northern Illinois U.) **A pre-vocational program for institutionalized mental retardates.** *Training School Bulletin*, 1971(Feb), Vol. 67(4), 228-234.—Describes a prevocational program designed to facilitate the institutionalized

mental retardate's return to the community. The program was designed in sequential phases to insure the maximum amount of success at each level of difficulty, with eventual total release from the institution as the final goal. Each step is discussed in terms of proceeding from dependence to independence.—*Journal abstract.*

5373. Gray, Bonnie L. & Weiss, David J. **Pilot study of the measurement of job satisfaction.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 611-612.

5374. Hendel, Darwin D. (U. Minnesota) **Test format and administration variables as related to the performance of mentally retarded adults on multifactor tests of vocational abilities.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 615-616.—It was hypothesized that modifications in test format and administration variables would improve the performance of mentally retarded adults on multifactor ability tests such as the General Aptitude Test Battery. 2 studies were designed to investigate: (a) individual vs. group administration and speeded vs. non-speeded conditions, and (b) standard vs. simplified instructions and standard vs. simplified practice. Although a significant main effect resulted for speeded vs. non-speeded conditions in all groups in Study 1, higher means were obtained for the speeded conditions. Results indicate that more radical procedural modifications in testing procedures may be required for mentally retarded clients.—*Author abstract.*

5375. Schumaker, Jean & Sherman, James A. (U. Kansas) **Training generative verb usage by imitation and reinforcement procedures.** *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 273-287. 3 retarded children (1 18-yr-old boy, and 1 16-yr-old and 1 14-yr-old girl) were trained, using imitation and reinforcement procedures, to produce past and present tense forms of verbs in response to verbal requests. 2 types of experimental sessions were arranged: training and probe. During training sessions, S was trained to produce 1 verb in both the past and the present tense. Then, in a probe session, the generalization of this training was tested by presenting to the S a series of untrained verbs interspersed with previously trained verbs. Responses to untrained verbs were never reinforced. Training sessions alternated with probe sessions throughout a multiple base-line design involving 4 classes of verb inflections as the base lines. The results showed that, as past and present tense forms of verbs within an inflectional class were trained, Ss correctly produced past and present tense forms of untrained verbs within this class. When verbs from 2 or more classes were trained, Ss correctly produced the verb tenses from each of these classes. Thus, the imitation and reinforcement procedures were effective in teaching generative use of verb inflections (15 ref.).—*Journal abstract.*

5376. Skaarbreivik, Karl J. (Tromsø off. Laererskole, Norway) **A follow-up study of educable mentally retarded in Norway.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 560-565.—Information concerning the present status of 174 educable mentally retarded individuals, 124 males and 50 females, who had been discharged from Norwegian vocational training schools for educable retardates in 1959 and 1960, was obtained in 1967. Data with regard to economy, occupation, social life, criminality, and official support were collected from several official agencies. The information obtained indicated that approximately 1/3 of

the research population was self-supporting with a fairly good standard of living, and that only about 1/4 needed continuous official support. While most of the male Ss were employed in industry or construction, a substantial number of the females were housewives. The relationship between some personal variables and adjustment to society was analyzed. This analysis emphasized the importance of other handicaps as an important factor in addition to low intellectual abilities.—*Journal abstract.*

5377. Wargo, Donald G. & Meek, Virgelia C. (Children's Asthma Research Inst. & Hosp., Denver, Colo.) **Concept identification performance as a function of experimenter warmth in educable mental retardates and nonretarded rehabilitation clients.** *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 593-598.—24 educable mentally retarded (EMR) rehabilitation center students and 24 nonretarded rehabilitation students were randomly assigned to 1 of 2 Es who provided 1 of 3 types of informative feedback ("warm," "cold," or "mechanical") in a serially presented visual concept identification task involving 2 relevant and 1 irrelevant nonredundant binary dimensions. The data were analyzed by repeated-measures analysis over the course of the problem. Results indicate no overall differential response to E warmth for the 2 groups, but there was some indication that the "warm" condition offered by 1 of the Es may have constituted a distraction for the retarded Ss on early trials. The overall difference between retardates and nonretardates in terms of mean errors was reduced considerably by dropping out postsolution data, suggesting that presolution performance over the 1st 1/2 of the problem did not significantly differ for the 2 groups. Implications for the understanding of retardate cognitive functioning are discussed.—*Journal abstract.*

PHYSICAL ILLNESS

5378. ———. Aldosterone, angiotensin, and hypertension. *British Medical Journal*, 1970(Mar), Vol. 1(5699), 769.—In 1955 J. W. Conn described primary aldosteronism, in which excessive secretion of aldosterone is associated with hypertension, and this has led to a great deal of clinical investigation and speculation. Recent studies of aldosterone excretion or excretion rates have clarified the relationships. Results of these studies are described. The part played by aldosterone in the development or continuation of hypertension is uncertain, but, like angiotensin, it increases the intracellular concentration of sodium. Primary aldosteronism is a rare cause of hypertension, accounting for well below 1% of all hypertensive patients. Varieties of aldosteronism are discussed. Differentiation of these syndromes from essential hypertension is important, since they afford the opportunity for rational treatment by aldosterone antagonists or surgery, whereas management of essential hypertension remains empirical in the absence of knowledge of its cause. (27 ref.) S. R. Diamond.

5379. Doll, Richard E., Rubin, Robert T., & Gunderson, E. K. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Life stress and illness patterns in the US Navy: II. Demographic variables and illness onset in an attack carrier's crew.** *Archives of Environmental Health*, 1969(Nov), Vol. 19, 748-752.—Studied approximately 1/3 of the enlisted crew of an attack carrier (N=738) during a 6-mo

deployment to Vietnam. Questionnaires about personal background and military status were given at the beginning of the cruise, and the illnesses developed by these men during the cruise were tabulated. Discussed is the relationship of 16 demographic variables to illness onset: job specialty, pay grade, age, race, religion, birth region, marital status, number of dependents, education, socioeconomic status, active duty status (regular vs. reserve), IQ level, parents' status (living or deceased), birth order, father's occupation, and father's education. On the basis of analyses of variance, the following demographic variables were found to have a significant overall relationship to illness incidence: job specialty, age, pay grade, race, birthplace, and number of dependents. The remaining 10 variables were statistically unrelated to illness incidence. Relatively high illness rates occurred in younger, nonrated seamen, especially those in the fireman/fireman apprentice category who worked on the ship's engines. Relatively high illness rates also occurred in Negro and American Indian sailors.—*Journal abstract.*

5380. Gelst, Harold. (Everett A. Gladman Memorial Foundation, Oakland, Calif.) **Emotional aspects of dermatitis.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 627-628. 100 patients in 5 separate diagnostic categories, each including 20 dermatology patients, were studied by the MMPI, Rorschach, and Draw-a-Person tests. The diagnostic categories were acne, vulgaris, atopic dermatitis, hand eczema, psoriasis, and cellulitis. Test results were analyzed qualitatively and quantitatively. The mean scores for each patient for each scale of the MMPI were computed. For the Rorschach a composite psychograph was made by getting the mean movement, diffusion, vista, texture, achromatic, and bright color variables of the psychograph. The most severe psychopathology was in the psoriasis group. Both unexpressed rage and psychosexual deviation were the primary psychopathological characteristics found, together with schizophrenic signs.—*Author abstract.*

5381. Hódosi, Rezső. (Medical I, Budapest, Children's Clinic, Hungary) **Diabeteses gyermekek személyiségfejlődési problémái és nyaraltatásuk során szerzett tapasztalatok.** (Problems of personality development in children suffering from diabetes and experiences gained during their stay in a vacation camp.) *Psychologiai Tanulmányok*, 1968, No. 11, 521-528. In the 1st part of the study, psychopathological factors affecting the personality of the children at the onset of diabetes mellitus are analyzed. The particular phases of the psychopathological process and their characteristics are recounted. Impact of the illness on the child and the family structure is examined, noting the relation and interaction of factors involved. The role of anxiety associated with diabetes and that of ensuing frustrations is stressed. It is pointed out that personality distortions brought about by the illness differ markedly from those occurring in the premorbid personality. Certain response types that develop following particular phases of the illness are described. The 2nd part of the study deals with the psychological problems diabetic children had in the vacation camp. In spite of initial difficulties in the field of adjustment, being sent to the vacation camp constituted an important social experience for them. A longer stay in a holiday camp is recommended since the personality disturbances can be treated more effectively there. (Russian summary)—*English summary.*

5382. Jenkins, C. David. (U. North Carolina, School of Public Health, Chapel Hill) **Psychologic and social precursors of coronary disease: II.** *New England Journal of Medicine*, 1971(Feb), Vol. 284(6), 307-317.—Presents a comprehensive review of 160 papers concerning psychological and social factors involved in coronary disease. Studies from various countries agree that life dissatisfactions and stress are correlates of ischemic heart disease. Blohmke and others have reported that men in 5 categories of coronary disease differed from healthy controls by 1 or more of the following variables: tedious work, job difficulties, or feeling ill at ease at work. S. Wolf, J. Bruhn, and H. Kits van Heijningen have indicated, in separate studies, that job dissatisfaction and frustrations are predisposing factors to myocardial infarctions. S. M. Sales and J. House reported an observed association of mortality and job dissatisfaction which was independent of social class. "The clinical judgment of stress by physicians or patients' self-ratings has also been associated with coronary disease, apart from reference to the external events or conditions triggering it. A particular problem exists in retrospective studies in that it is difficult, if not impossible, to distinguish the stress reaction consequent to severe disease from that preceding it." Other researchers have identified and accepted the existence of a coronary prone behavior pattern characterized by extreme competitiveness, impatience, perfectionism, hyperalertness, and pressing needs for achievement. Recurrent and fatal myocardial infarcts have been associated with this behavior pattern. (162 ref.)—*B. A. Stanton.*

5383. Köttgen, Ulrich. (U. Mainz, Kinderklinik, W. Germany) **Das kranke Kind und die Familie.** [The sick child and the family.] *Praxis der Psychotherapie*, 1969(Dec), Vol. 14(6), 261-266.—Demonstrates how diseases of early life threaten and upset the equilibrium of family life. Under pressure, mothers often lose sound judgment which results in family unrest. Forms of defensive mother behavior (e.g., overprotection) are common. The responsibility distribution within the entire family structure is altered. After recuperation, the need for special care and treatment of the child remains as a further burden to the family. In the case of incurable or handicapped children, the climax of the family crisis occurs when the parents learn that there is no hope for complete recuperation. In this instance, there is a large, painful spectrum of alternative decisions to be made, and medical and educational counseling are indispensable.—*B. Stanton.*

5384. Krüskemper, Gertrud & Krüskemper, Hans L. (Hannover Medical Coll., W. Germany) **Neurotische Tendenzen und Extraversion bei Hyperthyreose.** [Neurotic tendencies and extroversion in hyperthyroidism.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1970(Apr), Vol. 16(2), 178-189.—14 patients with decompensated diffuse hyperthyroidism were given a number of psychological tests which also included the MPI and Maudsley Medical Questionnaire (MMQ). These tests were administered (a) before a medicinal-thyrostatic therapy (test), and (b) after a euthyroid metabolism of at least 3 mo. (retest). With 1 exception the MMQ showed a decrease in neurotic tendencies with the mean group value of 19.07 (test) sinking to a normal value of 12.35 (retest). The Lie scale remained constant with 11.21 as compared to 11.64. The Neurosis scale of the MPI after treatment sank significantly

from 26.21 in the test to 18.36 in the retest. The mean value of the extroversion-introversion dimension shifted from 20.93 in the direction of the extroversion pole to a value of 24.5. An assessment made by 10 physicians and thyroid experts of the patients' answers to the individual items proved more reliable for the MMQ than for the MPI.—*B. Schay.*

5385. Levendel, László; Mezei, Árpád; Nemes, Livia, & Litvai, Mihályne. **Adatok a tüdőgümőkór okozta cor pulmonale chronicumban szenvedő betegek személyiségéhez.** [Data concerning the personality of patients suffering from cor pulmonale chronicum caused by tuberculosis.] *Pszichológiai Tanulmányok*, 1968, No. 11, 507-519.—Examined personality patterns of Ss suffering from cor pulmonale chronicum caused by severe tuberculosis of the lungs with the Rorschach test in order to establish adequate methods for their institutional care. Rorschach scores assumed to characterize cor pulmonale were checked on 50 Ss whose cor pulmonale diagnosis was unequivocally established, on 50 tuberculous Ss who were free of cor pulmonale, and 32 healthy Ss. The difference between the 3 groups proved to be statistically significant. The sign-list characterizing records of the experimental group includes the signs of extreme insecurity previously found in tuberculous Ss, defect responses generally occurring in chronic illnesses, and signs of malignity made up of responses expressing severe disturbance or dissolution of the body image. The records reveal that the Ss are infantile, dependent, and passively withdrawn which is in keeping with their restricted motility. Scores indicative of dysphoria, depression, anxiety, and repressed aggression complete the personality picture. (Russian summary) (17 ref.)—*English summary.*

5386. Lustig, Felicia M. (New York U.) **A study of the effect of a pulmonary rehabilitation program on anxiety, medical orientation, social introversion, attitude toward work, and engagement in vocational activities in patients with chronic obstructive pulmonary emphysema (COPD).** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3344-3345.

5387. McDaniel, James W. (U. Colorado, Medical School, Denver) **Physical disability and human behavior.** New York, N.Y.: Pergamon, 1970. xiii, 231 p. \$7.95.

5388. Rubin, Robert T., Gunderson, E. K., & Arthur, Ransom J. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Life stress and illness patterns in the US Navy: III. Prior life change and illness onset in an attack carrier's crew.** *Archives of Environmental Health*, 1969(Nov), Vol. 19, 753-757.—Studied approximately 1/3 of the enlisted crew of an attack carrier (N = 687) during a 6-mo deployment to Vietnam. The Schedule of Recent Experience (SRE), designed to document significant recent life change, was administered at the beginning of the cruise, and the illnesses developed by these men during the cruise were tabulated. The relationship of prior life change to illness onset is discussed. Initially, an item weighting system which was constructed from civilian populations failed to be used in scoring, but this scoring system was discarded to discriminate future illness. A new weighting system was then derived by stepwise multiple regression analysis, which was done separately for unrated seamen and petty officers. Several different items emerged as unique predictors for these 2 groups of men. The life change scores based on the regression-derived weighting system

clearly and significantly discriminated future illness, indicating that new SRE scoring methods can be useful in illness prediction in small samples. (17 ref.)—*Journal abstract.*

5389. Rubin, Robert T., Gunderson, E. K., & Doll, Richard E. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Life stress and illness patterns in the US Navy: I. Environmental variables and illness onset in an attack carrier's crew.** *Archives of Environmental Health*, 1969(Nov), Vol. 19, 740-747.—Studied approximately $\frac{1}{3}$ of the enlisted crew of an attack carrier (N = 738) during a 6-mo deployment to Vietnam. Cruise activities, work conditions, and the illnesses developed by these men during the cruise were tabulated. The relationship of the environmental variables of ship's activity and work (division) assignment to illness onset is discussed. The majority of illnesses occurred in a relatively small portion of the population; 29% of the men developed 75% of the illnesses. This distribution was similar to those found in other studies of military and working populations. The high incidences of dermatological, respiratory, and gastrointestinal illnesses were similar to those reported for other military enlisted populations. The rates for both overall illness and for most individual illness categories showed a consistent elevation during combat periods compared to inport periods; an exception was the period of Sea of Japan operations surrounding the Pueblo crisis. Occupation appeared to be an important factor influencing illness incidence; illness rates were higher in those groups of men who performed physically demanding or hazardous tasks and who worked in hostile environments. (17 ref.)—*Journal abstract.*

5390. Schneider, Pierre B. **Le médecin: Thérapeute ou psychothérapeute?** [The physician: Therapist or psychotherapist?] *Revue de Médecine Psychosomatique et Psychologie Médicale*, 1970(Fal), Vol. 12(3), 241-253.—Poses the question of whether the therapeutic action of the physician is able, in certain circumstances, to inspire a psychotherapeutic model. It is suggested that the physician may regard the illness itself, rather than the patient, as the object of study. This type of approach is seen to be necessary in clinical diagnostics; however, treatment should entail consideration of the total patient, including his personality. The physician is in a position of direct access to information concerning the affective life of the patient.—B. A. Stanton.

5391. Schubert, Josef. (U. Saskatchewan, Regina, Canada) **Rorschach protocols of asthmatic boys.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 16-22.—4 Rorschach protocols illustrate the divergence of reactions found in asthmatic children. None of the diagnostic groups, subdivided on the basis of severity of asthma and parental attitude, was found to be psychologically homogenous. In physiologically severe asthma, neurotic anxiety is related to a good prognosis and emotional constriction is related to a poor diagnosis. With physiologically mild asthma, anxiety is related to a poor prognosis.—*Journal abstract.*

5392. Vernon, McCay. (Western Maryland Coll.) **Usher's syndrome: Deafness and progressive blindness: Clinical cases, prevention, theory and literature survey.** *Journal of Chronic Diseases*, 1969(Aug), Vol. 22(10), 133-151.—Presents a multidisciplinary survey and synthesis of the literature on Usher's syndrome: congenital deafness and retinitis pigmentosa

with CNS degeneration. Although rare in the general population, the disease is significantly prevalent among the deaf. By complete auditory, visual, and vestibular diagnostic procedures heterozygote carriers of Usher's may be identified and victims may be diagnosed earlier. Prevention is strongly urged in view of the trauma and chronicity of the affliction. High risk diagnostic screening coupled with genetic counseling is considered both feasible and practical. Research into biochemical, genetic, metabolic, psychiatric, and other behavioral aspects of Usher's is described as having great generality. Usher's represents a centering of gross CNS pathology with major psychological correlates such as aphasia, memory pathology, psychosis, and mental retardation. An understanding of the pathogenesis of Usher's may give insight into causes of forms of these other conditions. Data on 8 cases are presented. (92 ref.)—*Journal summary.*

COMMUNITY SERVICES

5393. Armsby, Richard E. (Hawaii State Hosp., Honolulu) **The adolescent crises team: An experiment in community crises intervention.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 735-736.—106 adolescents (mostly drug abusers and runaways) referred for inpatient treatment were treated in their homes for 2-8 sessions with their families and other significant people. The adolescent crisis teams were composed of trained nonprofessionals and natural helpers in the community. Full use was made of existing community resources. During 6 mo. of operation, 22% of the adolescents were referred for inpatient treatment, 40% were referred for outpatient follow-up, and 38% needed no further treatment. Costing only $\frac{1}{10}$ as much, adolescent crisis teams have proven an effective alternative to hospitalization.—*Author abstract.*

5394. Scher, Maryonda. (Veterans Administration Hosp., Seattle, Wash.) **The place of the mental hospital in community mental health.** *Hospital & Community Psychiatry*, 1970(Mar), Vol. 21(3), 85-87.—Reports that the education of the public to their responsibilities for the care of the mentally ill within the community has resulted in an unwanted negative conception of the mental hospital. It is maintained that the need for mental hospitals, locked doors, and medical management still exists and its importance for rehabilitation of the patient must not be underestimated. S Knapp.

5395. Zacker, Joseph & Bard, Morton. (City Coll., City U. New York) **Community institutions resist change: Neurotic or adaptive?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 729-730. Mental health professionals, like other people, tend to adopt conceptual styles appropriate for the situations they deal with most often. It may be disadvantageous, however, to transfer such conceptual styles to such unfamiliar situations as, for example, working with community institutions. The traditional psychotherapeutic view of resistance as a maladaptive effort to avoid anxiety based on fears of the unknown is discussed as 1 such conceptual style. An incident wherein police recruits resisted innovative training methods is discussed to illustrate how a conceptual style might have precluded empathic appre-

ciation of an institution's needs and structure.—*Author abstract.*

GERIATRICS

5396. Burnside, Irene M. (U. California, Medical School, San Francisco) **Group work with the aged: Selected literature.** *Gerontologist*, 1970(Fal), Vol. 10(3, Pt. 1), 241-246.—A review of the literature suggests "that leaders adopted group principles and group dynamics to a variety of groups and settings. Group methods and approaches ranged from book-discussion groups to psychoanalytic therapy groups." Diverse mental health personnel provided leadership. "Important traits in the group leader were: flexibility, warmth, perseverance, patience, and ability to listen." Studies on the effectiveness of group work with the aged are lacking. Questions are raised concerning the characteristics of an "older persons" group, particularly in relation to age and disability breakdowns. The effect of coleadership and progress goals also need exploration. (32 ref.)—*J. Linnick.*

5397. Gaillard, J. M. (U. Geneva, Psychiatric Clinic, Switzerland) **La désintégration du schéma corporel dans les états démentiels du grand âge.** [The disintegration of the body schema in elderly patients with states of dementia.] *Journal de Psychologie Normale et Pathologique*, 1970(Oct), No. 4, 443-472.—It was found that the representation of the body is affected by 2 types of mechanisms: (a) the structure of space representation which is metric up to the level of concrete operations and becomes typological at the preoperational level, and (b) the relative importance of parts of the body for the S. The known body is very dependent upon the symbolic function. At the infrasympbolic level a knowledge of the body no longer exists. Cases of vascular dementia present a problem particularly interesting with regard to the possibility of the representation of the body, without touching aspects of the body schema, in relation to its operation or symbolic function. However, in the Pick syndrome, the body schema is retained despite advanced dementia. (18 ref.)—*L. A. Ostlund.*

5398. Goldberg, Harold L., Latif, Janet, & Abrams, Seena. (West-Ros-Park Mental Health Center, Boston, Mass.) **Psychiatric consultation: A strategic service to nursing home staffs.** *Gerontologist*, 1970(Fal), Vol. 10(3, Pt. 1), 221-224.—Describes geriatric patients with acute behavioral disorders and the practical objectives for managing such patients. The methods and successful results of a specific program established between a psychiatric consultation team and local nursing home staffs for the main purpose of preventing unnecessary hospitalizations are reviewed and discussed.—*Journal abstract.*

EDUCATIONAL PSYCHOLOGY

5399. Bjerstedt, Å. & Nilsson, B. (Malmö School of Education, Sweden) **Department of Educational and Psychological Research, Malmö: Some notes on current activities.** *Educational & Psychological Interactions*, 1970(Dec), No. 35, 18 p.—Presents a survey which includes historical notes, information on organization and training programs, and brief descriptions of the major research and development projects in progress.—*Journal abstract.*

5400. Bonboir, Anna. (U. Louvain, Belgium) **L'observation au service de l'experimentation en psychologie scolaire.** [The role of observation in experimentation in scholarly psychology.] *Educational Sciences*, 1970(May), Vol. 4(1), 5-10.—Explores the relation between empiricism, systematics, and epistemology in educational research, with special reference to methodology. In particular the fact that "the independent variable X" (whichever is chosen) has to be determined in an evolving educational situation raises problems of cumulative effects difficult to assess by conventional research methods. (German summary, —*English abstract.*)

5401. Conway, Jerome K. (U. Toronto, Medical School, Ontario, Canada) **Forms of information representation and cognitive operations.** *Viewpoints*, 1970(Sep), Vol. 46(5), 155-163.—Anticipates that multiple vs. single channel studies will be relegated to the same category as most comparative media research—an unproductive experience of only passing, historical interest. As the role of research becomes more clearly associated with the broader goal of a theory of instruction, and as we begin to make discriminations of a higher order than "2 of something versus 1 of another," our efforts may yet become a focal part of the everyday assumptions of audiovisualists.—*Journal summary.*

5402. Descamps, Marc A. (Sorbonne, Paris, France) **La relation enseignant-enseigné au début des études de psychologie.** [The teacher-student relationship in introductory psychology courses.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(6-8), 453-457.—17 teachers of psychology and 82 1st-yr psychology students were questioned regarding their perceptions of themselves and their respective roles in the classroom. Teachers were asked what qualities they liked in students and what qualities they felt students liked in their teachers, and students were asked what qualities they liked in their teachers and what qualities they thought teachers liked in their students. Teachers were in substantial agreement as to what qualities they liked in their students (88%) but less so regarding what they felt students liked in their teachers (47%). Students were in 65% agreement as to the qualities they liked in their teachers, but only 46% agreement as to the qualities they thought teachers liked in their students. Comparative data are presented.—*R. E. Smith.*

5403. Dürö, Lajos. (U. Szeged, Hungary) **A pszichológiai-pedagógiai kísérlet metodológiai jelentősége a személyiség erkölcsi fejlődésének vizsgálatában.** [Methodological significance of psycho-pedagogical research in the moral development of personality.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 185-198.—Discusses psychopedagogical experiments for the assessment of personality traits, analyzing the methodological connections of its development. The experimental character of investigation as well as the general methodological significance, are noted. It is also noted that psychopedagogical experiments aimed at a synthetic study of personality play an important part in transforming the functional attitude and the pedagogical aspect which are inappropriate when considering the child. (Russian summary) (19 ref.)—*English summary.*

5404. Eisner, Elliot W. (Stanford U.) **Media, expression, and the arts.** *Viewpoints*, 1970(Sep), 46(5), 103-118.—Describes the relationship between media, expression, and the arts, and suggests what these relationships imply for educational practice and media

research. To do this requires brief excursions into the demands visual works make on those who wish to encounter them on the plane of meaning. 7 ideas are discussed: (a) expression is a consequence of intelligence; (b) the arts are one of man's major expressive modalities, hence depend on intelligence; (c) expression proceeds through the forms of art by virtue of the symbols, syntaxes, and media with which the artist works; (d) the expressiveness of the arts is known by the experience the forms of art evoke; (e) to experience art forms requires an ability to "read" the form, i.e., to decode what artists have encoded; (f) artistic development depends not only on the artist's ability to create new symbols and syntaxes but also on the nature of the media available; and (g) new forms of art evoke new forms of experience, inform us about the qualitative aspects of life, and reawaken our awareness to the old.—*Journal summary.*

5405. Fischer, Constance T. (Duquesne U.) **Levels of cheating under conditions of informative appeal to honesty, public affirmation of value, and threats of punishment.** *Journal of Educational Research*, 1970(Sep), Vol. 64(1), 12-16.—Examined conditions conducive to minimal classroom cheating. 135 4th-6th graders were given the opportunity to cheat on a 60-item general achievement test. Ss were assigned to 5 experimental conditions: (a) control, (b) informative appeal to honesty, (c) public affirmation of the value of not cheating, (d) value-relevant threat of punishment, and (e) non-value-relevant threat of punishment. A majority of Ss cheated under conditions a and b, but a significant decrease occurred in the last 3 conditions. No significant differences were found between the cheating under the last 3 conditions. In view of other studies and developmental theory, public affirmation of the value of not cheating is suggested as the preferable classroom technique for minimizing cheating.—*Journal abstract.*

5406. Fleming, Malcolm I. (Indiana U.) **Media research projects: Considerations from a perceptual point of view.** *Viewpoints*, 1970(Sep), Vol. 46(5), 119-136.—In this paper, messages are "seen as objects of the perceptual process, objects which both facilitate the process of information extraction and place limits upon the amount and kind of information extracted. Within this context, interest lies in such problems as the media correlates of perception and the perceptual correlates of learning . . . the collection of perceptual data in message studies, while not yielding sufficient information in most cases, can provide the basis for a more complete and more analytical account of the learner's behavior with reference to more of the details and subtleties of the stimulus." Some implications of perceptual research are reviewed and "attention has been directed toward some of the medium or message conditions for perception that might be investigated further." (17 ref.)—*I. Linnick.*

5407. Glick, Oren. (U. Puget Sound) **Interaction effects of sex of mother's child and child's reading performance on the mother's evaluation of the school.** *Journal of Educational Research*, 1970(Nov), Vol. 64(3), 124-126.—Selected from 2 schools 24 3rd graders performing at or above the reading criterion and 68 below that level. Ss' mothers were interviewed and evaluated the schools on an 11-point scale for the past, present, and future. The reading criterion factor did not significantly differentiate the groups. Sex of the child did approach significance, with a positive relationship between evaluations and performance for girls and a

negative relationship for boys. For mothers of Ss performing below criterion, sex was not significant. For Ss performing above criterion, mothers of girls rated the schools more favorably than mothers of boys, who supplied the lowest mean ratings. The attribution of responsibility for poor performance was examined in the mothers of 10 female and 4 male Ss. Ratings of the child's or the school's responsibility support the hypothesis that mothers of girls would consider the school most responsible, while mothers of boys would consider the child himself responsible.—*S. Knapp.*

5408. Hengen, Nona L. (Southern Oregon Coll.) **Perception of danger in action illustrations: Implications for nonverbal communication in education.** *Bulletin of the School of Education, Indiana U.*, 1970(Jul), Vol. 46(4), 1-68.—In a world oriented to pictorial illustration, standards for visual literacy need to be developed. In this article "specific picture elements that significantly change the pictorial connotations a reader derives from reading a structured stimulus picture" are analyzed. It is concluded that to become "better picture readers, is an ability that can be taught." Implications for audiovisual communications and for education are considered.—*I. Linnick.*

5409. Kratochvil, Daniel W., Carkhuff, Robert R., & Berenson, Bernard G. (American Inst. for Research, Palo Alto, Calif.) **Cumulative effects of parent and teacher offered levels of facilitative conditions upon indices of student physical, emotional, and intellectual functioning.** *Journal of Educational Research*, 1969(Dec), Vol. 63(4), 161-164.—Tested 80 5th grade students, 38 of their past and present teachers, and their parents (76 mothers and 69 fathers) to determine the relationships between parent and teacher-offered levels of facilitative conditions and indices of student physical, emotional, interpersonal, and intellectual functioning. Levels of facilitative conditions offered by parents and teachers were determined by their levels of communication and discrimination. Student levels of functioning were measured by 2 indices of physical functioning: (a) height-weight, and (b) physical fitness test scores; 2 indices of emotional functioning: (a) level of communication, and (b) level of discrimination; 2 indices of intellectual functioning: (a) GPA, and (b) achievement test scores; and 1 index of creativity-productivity, a 42-item questionnaire concerning student achievements. Results indicate that the cumulative effects of parent and teacher offered levels of facilitative conditions on student functioning were not significant. In 1 instance the immediate effects were significant.—*Journal abstract.*

5410. McDonald, Frederick J. (New York U.) **Relationships of media to observational learning.** *Viewpoints*, 1970(Sep), Vol. 46(5), 137-154.—Suggests that observational learning is an established psychological fact. People do learn by observing. The media problem is to use the media to facilitate observational learning. The facilitation can take the form of a more effective portrayal of the model's behavior. The author's preference in designing training programs is to combine what is known about feedback systems with what is known about modeling systems to create new kinds of instructional systems that alternate modeling and feedback phases. The guiding principle seems to apply, i.e., that the modeling is most effective in the early phases of learning and feedback systems are needed to maintain the learning.—*Journal summary.*

5411. Meredith, Patrick. (U. Leeds, Epistemic Com-

munication Research Unit, England) **Number, space and measurement: I. Educational Sciences**, 1970(May), Vol. 4(1), 37-55.—Presents the 1st part of an epistemic analysis of certain fundamental concepts in mathematics. The purpose is to reconcile the abstractness of mathematics with the concreteness of psychophysical events both in the discovery and proof of new theorems and in the communication and learning of established concepts. Since, whatever other materials may be involved, mathematics is most commonly an activity with ink and paper, governed by documentary conventions, the structural properties of the "medium" combine with those of the "message." The result is only partly rational. By analyzing the notation, it is shown that the relation between the distribution of symbols in a printed volume and their temporal transitions, involved in reading and turning pages, can point the way to an isomorphism between abstract structure and concrete expression. (French & German summaries)—*Journal abstract*.

5413. Smith, Vernon. (Indiana U.) **The teacher's prejudices and the children's dialects**. *Bulletin of the School of Education, Indiana U.*, 1969(Nov), Vol. 45(6), 127-144.—Explores communication with the culturally different in the classroom as 1 facet in the general problem in the education of children. "All dialects are standard or acceptable except the language of the poor." The culturally different child is expected to learn the standard spoken dialect (ignoring the dialect he has already learned), the language of instruction, and the written or literary dialect, and also has to adapt to the standards and values of his teacher. Suggestions are offered to the teacher to become more concerned with the children's feelings than with their overt behavior, to accept them, and to respect them as they are. (26 ref.)—*I. Linnick*.

5414. Van Zyl, P. (Randse Afrikaanse U., Johannesburg, South Africa) **Die struktuur van die pedagogiek en sy deeldisiplines**. [The structure of pedagogy and its part disciplines.] *Opvoedkundige Studies*, No. 57, 61 p.—Considers terminology difficulties between "education" and "pedagogy." The history of pedagogy is outlined, and the part disciplines of fundamental, anthropological, psychological didactic, comparative, and historic pedagogy are discussed. It is concluded that pedagogy is a humanitarian science. The other humanitarian sciences—philosophical anthropology, psychology, sociology, biology, physiology, history, and theology—are considered to be "marginal sciences" which can contribute to pedagogy, but not prescribe for it. A full text English translation is included. (48 ref.)—*S. Knapp*.

5415. Williams, D. I. & McComisky, J. G. (U. Hull, England) **Effect of change in stimulus setting on visual task performance: Implications for educational practice**. *Educational Sciences*, 1970(May), Vol. 4(1), 21-23.—Tested 28 15-16 yr. old boys in a task involving the checking of letter pairs. The material was in booklet form, a separate page being worked on in consecutive sessions. For the experimental group, pages were of different colors. For the controls, all pages were white. As predicted, the performance of the experimental

group was superior to that of the controls over the latter $\frac{1}{2}$ of the experimental period. (French & German summaries)—*Journal abstract*.

ATTITUDE & ADJUSTMENT

5416. Bailey, Robert E. (U. Florida) **Differences in the personal-social problems of Negro and Caucasian secondary school students**. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3326-3327.

5419. Chickering, Arthur W. (Goddard Coll.) **Civil Liberties and the experience of college**. *Journal of Higher Education*, 1970(Nov), Vol. 41(8), 599-606. —Examined the finding that students become more liberal during their college years. Students from 13 small colleges rated their agreement or disagreement with 3 questions on civil liberties as entering freshmen and at the end of their sophomore year. A net change toward liberalism was found, but the change was greater for men than for women. Moderate conservatives generally became more liberal, while the reverse was true for moderate liberals. All findings varied in magnitude from college to college. Institutional characteristics positively associated with increasing liberalism were (a) the proportion of liberal peers, (b) study motivated by interests or anticipated future activities, (c) student-faculty contact, and (d) demonstrations. Negatively associated characteristics were (a) the proportion of conservative peers, (b) emphasis on professional-vocational preparation and propriety, (c) emphasis on lecturing and memorization, and (d) study motivated by filling requirements and getting good grades. Implications for the planning of educational practices are discussed.—*S. Knapp*.

(St. Peter's Coll., Jersey City, N.J.) **Catholic attitudes and beliefs in transition: A decade study of a Jesuit college**. *Psychological Reports*, 1971(Feb), Vol. 28(1), 247-250.—Surveyed and compared the attitudes of 280 male and female Catholic undergraduates concerning 13 religion-oriented topics and 1 general "Life Style" area with results of a similar survey of 100 male Ss made 10 yr. earlier. Data suggest an over-all liberalization of ideas regarding all religion-oriented topics except "Labor Unions," where the reverse effect was noted. No change in life style opinions was observed.—*Journal abstract*.

5422. Dugmore, W. Owen & Grant, Claude W. (Central Washington State Coll.) **Experiment in cluster registration of college freshmen: Effects upon achievement, anxiety and perception of the college environment**. *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 216-218.—Studied the effects of cluster registration upon various aspects of student

experience at a state university. From among 81 1st quarter freshmen, undecided as to academic major, 7 groups of students were identified who had registered for the same general education courses and who could be kept together for the duration of the quarter in their respective groups (clusters) by assigning them to appropriate course sections. A control group of 71 was also used. Findings indicate that cluster registration (used in this investigation) did not improve the quality of the university experience of these Ss.—*Journal abstract.*

5423. Frantz, Thomas T. & Snider, Bill. (State U. New York, Buffalo) **Dimensions of student behavior.** *Journal of Educational Research*, 1969(Dec), Vol. 63(4), 181-184.—Attempted to determine the number and nature of dimensions which students perceive as underlying college student behavior. Previous research and theory indicate that approximately 5 dimensions (academic, social, vocational, nonconformity, and noncommitted) are appropriate for categorizing the behavior of college students. 99 students were given 2 130-item lists of behaviors exhibited by students and classified the behaviors in categories. Analysis of the categories using categorical analysis resulted in the identification of approximately 24 behavioral dimensions—clearly more than the 5 or 6 employed by most researchers. It was also found that men and women perceived behavior in somewhat similar dimensions.—*Journal abstract.*

(California State Coll., Los Angeles) **School phobia: Childhood neurosis or learned maladaptive behavior?** *Exceptional Children*, 1970(Nov), Vol. 37(3), 220-226.—Discusses school phobia, emphasizing Parent × Child interactions. Separation from the parent and home is seen as an essential process in normal growth. Disturbed separations are discussed as interruptions of maternal care. Theories of the etiology of school phobias include (a) separation anxiety; (b) mother-child symbiosis; (c) conflicts around aggression, regression, and dependency; and (d) the child's unrealistic self-image. Therapeutic strategies uniformly include the need to return the child to the classroom or to the school building as soon as possible. The use of psychoanalytic and desensitization approaches are discussed. (21 ref.) —P. McMillan.

Wisconsin, Milwaukee) **Achievement, sociability, and task importance in relation to academic cheating.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 302.—Examined behaviorally measured cheating in relation to self-report data on academic activity, social participation, and future plans among 27 ROTC upperclassmen. 1/3 of the Ss cheated on a difficult novel associations test. In relation to noncheaters, cheaters showed greater social participation and were more likely to intend to be career officers. Cheaters were not, however, significantly different from noncheaters on achievement variables.—*Author abstract.*

5430. Kirby, Frank D. & Toler, Hayward C. (Humboldt State Coll.) **Modification of preschool isolate behavior: A case study.** *Journal of Applied Behavior Analysis*, 1970(Win), Vol. 3(4), 309-314.—A 5-yr-old preschool boy with a low rate of interaction with his nursery school classmates was induced to pass out candy as a tactic to increase his rate of interaction with them. Interaction with classmates increased markedly during the periods he passed out choices of candy. These changes may have been due to increases in both his rate of initiating activities with his classmates and to increases in his classmates' rate of initiating activities with him. A total time of less than 1 hr. was required of the teacher during the experiment. *Journal abstract.*

5431. Klindová, Luboslava. (Research Inst. of Pedagogy, Bratislava, Czechoslovakia) **Niekol'ko poznámok k štruktúre a obsahu vzdelávania z hľadiska psychohygiény.** [Structure and content of learning from the point of view of mental hygiene.] *Jednotná Škola*, 1969(Apr), Vol. 21(4), 348-356. Discusses proposed reforms of general education schools. The principles of mental hygiene are related to the present state of learning and education. The organization of school life and some of the phenomena associated with required subjects are critically evaluated. The overburdening of pupils, the quality of the didactic system, and the standards of textbooks are considered. Attention is drawn to features in the conception of the general education schools which are at variance with the pupils' mental hygiene. Recommendations for changes are presented. 5432. Lindblom, Börje & Henrysson, Lennart. (School of Education, Malmö, Sweden) **Gymnasisternas attityder till studie- och yrkesorientering.** [Attitudes towards educational and vocational guidance among Swedish students at the "gymnasium" level.] *Pedagogisk-Psychologiska Problem*, 1970(Dec), No. 124, 24 p.—Evaluated the educational and vocational guidance programs in effect in Swedish gymnasia through questionnaire interviews with students in their last (3rd) gymnasium yr. Most students were dissatisfied with the present guidance programs, and felt that the programs should be reorganized. Most students found informational publications helpful, but few reported benefits from program-related radio and TV programs. Most

boys, but significantly fewer girls, found conversations with educational and vocational counselors helpful. Suggestions for the program's improvement are discussed. (15 ref.)—*D. W. Scott.*

5433. Livingston, Samuel A. **Simulation games and attitude change: Attitudes toward the poor.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Apr), No. 63, 14 p.—Investigated the effect of a simulation game on players' attitudes toward the poor by means of a pretest-posttest questionnaire study. The respondents were the senior class ($N = 202$) of an all-boys Catholic high school, who played the game for 4 periods in their social studies classes. Ss' attitudes were significantly more favorable to the poor after they played the game than before. The Ss' attitude change varied significantly from teacher to teacher, but was not significantly correlated with any of several other variables investigated. The game produced no change in factual information and a small but significant decline in interest in the subject matter.—*Journal abstract.*

5434. Loigman, Bernard. (Rutgers State U.) **Relationship between social adaptation and academic success of tenth grade students in two senior high schools.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3344.

5435. McPartland, James, et al. **Student participation in high school decisions: A study of 14 urban high schools.** *Center for Social Organization of Schools Report, Johns Hopkins U.*, 1971(Feb), No. 95, 191 p.—Presents the results of a questionnaire administered to 3450 11th and 12th grade students and 765 teachers from 14 high schools in the Baltimore-Washington area. The purpose of the study was to (a) define and categorize the existing and possible kinds of student participation in high school decisions, (b) describe attitudes concerning alternative decision-making procedures, and (c) analyze some likely effects of student involvement in decisions. The examination focused on distinctions between academic and nonacademic decisions, procedures and outcomes, and participation through holding authority vs. communication. Teachers and students both thought that students should have more voice in decision making, although teachers were generally less favorable especially in the academic area. Student attitudes about outcomes and procedures were analyzed by differences in the students (e.g., race, socioeconomic background, and sex). The effects of different kinds of student participation were analyzed. Effects of nonacademic participation were examined through extracurricular activities, student government, and the student court. Effects of academic participation were analyzed in a school which allowed a wide range of student academic choice. (7 p. ref.)—*Journal abstract.*

5436. Medinnus, Gene R. & Johnson, Theodore M. (San Jose State Coll.) **Parental perceptions of kindergarten children.** *Journal of Educational Research*, 1970(Apr), Vol. 63(8), 379-381.—Selected 21 well-adjusted and 21 poorly-adjusted kindergartners matched for CA, sex, IQ, and socioeconomic status. Semantic differential descriptions consisting of 50 bipolar adjectives were completed by Ss' parents and 2 kindergarten teachers. The hypothesis of a greater discrepancy in ratings between father and mother of poorly-adjusted children when compared to well-adjusted children was supported at the .05 level. Greater discrepancies were found between mother and teacher and father and teacher of the former group as compared with the latter.

The items showing significantly greater discrepancies of the poorly-adjusted as compared to the well-adjusted were identified. It is concluded that greater communication between parents and between parents and teachers is urgently needed in the case of the poorly-adjusted child.—*Journal abstract.*

5437. Noffsinger, Thomas. (Garfield Elementary School, Lake County Regional Program for Handicapped Children, Mentor, O.) **The effects of reward and level of aspiration on students with deviant behavior.** *Exceptional Children*, 1971(Jan), Vol. 37(8), 355-364.—Tested the efficacy of rewards and level of aspiration with children classified by Quay's Behavior Problem Checklist. 45 junior high age boys who were potential dropouts were classified according to deviant classroom behaviors. Ss were then tested in several different levels of aspiration and reward treatment combinations. Results show no differences between classifications of Ss and no hypothesized differences in the differential effectiveness of level of aspiration and reward for the types of students. Results also show that setting a high level of aspiration had a significant positive effect. (22 ref.)—*Journal abstract.*

5441. Price, J. R. & Magoon, A. J. (U. Delaware) **Predictors of college students' ratings of instructors.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 523-524.—A large sample of college students completed a 35-item course evaluation instrument. The instrument could be divided into 2 sections: (a) 11 course and student characteristics which presupposed no evaluative judgments; and (b) 24 rating items bearing on the course and instructor, all evaluative judgments. The results of a canonical analysis revealed 4 important correlations relationships. These suggested that students rate courses on the basis of instructor impact, workload, course structure, and whether the course is an elective or not. Important predictors were the expected grade in a course and availability of the instructor outside class. (a) members of this sample sought such help). *Author abstract.*

5442. Seidel, Harry E. (California State Coll., Pa.)

Attitudes, goals, achievements, and educational needs of adolescents from two Appalachian communities. *Journal of Educational Research*, 1970(May), Vol. 63(9), 424-429. Selected 81 pairs of students matched for sex and class attainment from the 10th, 11th, and 12th grades of a high school attended by residents of 2 neighboring but culturally and economically divergent communities. A semi-structured interview form was completed for each S. Analysis of information elicited on the topics of family life, employment, education, government, entertainment, peer groups, sex, and religion reveal significant differences between Ss from the 2 communities. Ss from the more prosperous town showed significantly higher educational and vocational ambitions, optimism, and satisfaction with their living conditions. It is suggested that school systems which embrace distinct populations might broaden their curriculum so that students can find a program best suited to their abilities.—*Journal abstract*

5445. Sohal, T. S. & Gupta, Mohan P. (Punjab Agricultural U., Ludhiana, India) **Students' motives behind strikes.** *Indian Educational Review*, 1970(Jul), Vol. 5(2), 97-106. Reports results of a survey of the motivational factors underlying students' involvement in strikes. A 25-item Likert-type questionnaire was devised and administered to a random sample of 90 undergraduates at an Indian college soon after they had gone on strike. The most important factors underlying strikes were strained relationships between teachers and students, misleading influence of senior students, inadequate entertainment and extracurricular activities, and influence of political parties. No significant relationship was found between age, academic grade, rural urban background, GPA of students, and their attitudes toward strikes. The study suggests that a greater amount of attention should be paid to the specific needs and aspirations of individual students.—*K. C. Panda.*

5446. Spradling, James W. (U. South Dakota) **An analysis of personality and environmental press in two church related colleges and a state university.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3356.

5447. Waterman, Alan S. & Waterman, Caroline K. (Rensselaer Polytechnic Inst.) **The relationship between ego identity status and satisfaction with college.** *Journal of Educational Research*, 1970(Dec), Vol. 64(4), 165-168. Conducted 2 studies at a technologically oriented university to investigate the relationship between E. Erikson's concept of ego identity and student attitudes toward college. Results of the 1st study with 32 undergraduates indicate that Ss going through an identity crisis over occupational choice had the least favorable evaluations of their education. Ss who had never experienced a crisis but were committed to a vocational goal were the most favorable. The 2nd study with 282 Ss demonstrated that Ss who went through a crisis over the choice of a major field while in college showed more negative attitudes than Ss who had not

experienced such a crisis. Findings suggest that the association of crisis with college is an important factor in student dissatisfaction.—*Journal abstract.*

5448. Weigel, Richard G. & McKinney, Fred. (Colorado State U.) **Self-oriented sentence completion responses and reported personal biographical data.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 201-202. Examined the relationship of responses on a self-oriented sentence completion blank and personal adjustment, as inferred from reported personal biographical data. The McKinney Sentence Completion Blank (MSCB) and a personal biographical data questionnaire were administered to 160 undergraduates. A self actualizing response pattern on the MSCB was found to reflect reported personal biographical data characteristic of unselected, emotionally healthy Ss while a defensive response pattern was positively related to biographical data characteristic of Ss with emotional problems. The immobilized affect response pattern did not appear to reflect immobilization in the traditional sense. Implications for counseling and for self-concept research are discussed.—*Journal abstract.*

5449. Weigel, Richard G., Weigel, Virginia M., & Hebert, John A. (Colorado State U.) **Non-volunteer subjects: Temporal effects.** *Psychological Reports*, 1971(Feb), Vol. 25(1), 191-192. Found differences in study habits and attitudes in samples of 318 general psychology students drawn at varying times during the academic term, although differences in manifest needs were not. It is suggested that the temporal differences in students' study habits and attitudes could well affect the generalizability of experimental findings.—*Journal abstract.*

5450. Weiss, Richard L., Sales, Stephen M., & Bode, Shelley. (U. Michigan) **Student authoritarianism and teacher authoritarianism as factors in the determination of student performance and attitudes.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 83-87. Recent investigations designed to elucidate the teacher behaviors which are facilitative of positive student attitudes and increased student performance have presented inconsistent results. It is hypothesized that the inconsistency between studies may be due to an interaction between teacher and student characteristics in the determination of the dependent variables involved. To test this hypothesis 10 teachers and 36 students in a West Coast high school were administered a revised version of the California I Scale. High- and low-I groups of both teachers and students were selected and students' grades and attitudes toward their teachers were observed. It was found that high-I students exposed to low-I teachers showed particularly low attitudes toward their teachers and particularly low grades. Data for other combinations of student and teacher characteristics were essentially equivalent. (17 ref.)—*Journal abstract.*

5451. Whittaker, David & Watts, William A. (U. California, Berkeley) **Personality characteristics associated with activism and disaffiliation in today's college-age youth.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 200-206. Contrasted a sample of 210 college students with the youthful members of 2 of 210 college students with the youthful members of 2 expressively alienated forms of nonconformity: 33 student activists committed to confrontation tactics to force social change and 151 disaffiliated college dropouts withdrawn from incompatible social conditions. Compared to other students, both nonconventional sub-

cultures appeared to have similar group profiles on the Omnibus Personality Inventory which reflected their greater intellectual disposition, nonauthoritarianism, and individual expressiveness. However, the Adjective Check List indicated that although both groups were significantly higher on need for autonomy and change and lower on order, they were differentiated by other need scales. Compared to dropouts, activists, like other students, were higher on dominance and achievement and lower on succorance and, unlike students, higher on aggression. Furthermore, activists were higher than students on exhibition and lower than dropouts on abasement whereas dropouts were higher on heterosexuality and lower on endurance than students. (21 ref.)—*Journal abstract.*

5452. Williams, Eva L. (North Texas State U.) **The relationship of selected factors to teacher and student preferences in simulated situations.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3359.

5453. Williams, Robert L. (U. Tennessee) **Personality, ability, and achievement correlates of scholastic attitudes.** *Journal of Educational Research*, 1970(May), Vol. 83(9), 401-403. Administered the California Study Methods Survey to 1818 high school students to assess attitudes toward school. 56 satisfied and 65 dissatisfied Ss were selected and compared with the California Short-Form Test of Mental Maturity, the reading and mathematics sections of the California Achievement Test, GPA, the Bell Adjustment Inventory, and the Tennessee Self-Concept Scale. The groups differed significantly on all dependent measures, with the satisfied group obtaining superior ability, achievement, and personality scores. When intellectual ability was controlled, the groups did not differ on achievement measures, but the dissatisfied group still scored significantly lower on personality measures and average GPAs. Results suggest that the personality dimension affects the student's work and relationship with his teachers to produce diminished evaluation of his academic progress. (16 ref.)—*Journal abstract.*

5454. Winthrop, Henry. (U. South Florida) **Abuses of sensitivity training on the American campus.** *Bulletin of the Menninger Clinic*, 1971(Jan), Vol. 35(1), 28-41. Delineates the various weaknesses in sensitivity training on the campus. The distinctions made "among the 3 separate concepts of anti-rationality, irrationality, and non-rationality are extremely germane to the professional degradation that sometimes occurs in the basic encounter group and to the abuses in procedure and the improprieties of outlook that occasionally crop up in such groups." Although the focus of attention is on sensitivity training groups on the American campus, it is thought that the remarks may be "applicable in substantial measure to many such groups of extramural origin."—*J. Z. Elias.*

5455. Young, Mary L. (U. Minnesota) **Personal-social adjustment, physical fitness, attitude toward physical education of high school girls by socioeconomic level.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 593-599. Tested 114 11th grade girls representing 3 socioeconomic groups to determine whether there were any significant differences between socioeconomic groups with reference to personal-social adjustment, attitude toward physical education, and physical fitness. These variables were measured by the California Test of Personality—Secondary Form AA, the Wear Attitude Inventory—Form A, and the American Association for

Health, Physical Education, and Recreation Youth Fitness Test. Socioeconomic level was determined using McCall's Scale. Relationships between these variables for the entire group and for each socioeconomic group were investigated. Results show a significant difference between socioeconomic groups in the matter of personal-social adjustment, with the high socioeconomic group showing better adjustment scores than the middle group and the middle better than the low group. There were also significant positive relationships between the following variables: physical fitness and attitude toward physical education, physical fitness and personal adjustment, and attitude toward physical education and personal-social adjustment. These relationships, at times, differ according to socioeconomic level.—*Journal abstract.*

5457. Backman, Margaret E. (Douglas Coll., Rutgers State U.) **Patterns of mental abilities of adolescent males and females from different ethnic and socioeconomic backgrounds.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 511-512.—Examined patterns of mental abilities, composed of group means of 6 factors. The sample, consisting of 2925 12 graders from the nationwide study Project TALENT, included Jewish-whites, non-Jewish-whites, Negroes, and Orientals from 2 socioeconomic status (SES) levels. The statistical model was an analysis of variance. Ss exhibited patterns of mental abilities characteristic of their sex; these patterns were somewhat modified by ethnic background. Sex accounted for 69% of the total variance and ethnicity for 13%. Differences related to SES accounted for only 2% of the total variance and were considered unimportant.—*Author abstract.*

5461. Carver, Ronald P. & Darby, Charles A. (Amer-

ican Inst. for Research, Silver Spring, Md.) **Development and evaluation of a test of information storage during reading.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 33-44.—Previous research has suggested potential advantages for a new type of item for measuring comprehension in reading and listening. The test items are called "chunked" and consist of groups of meaningfully related words in which certain groups have been changed in meaning from the original passage. A chunked type of test, designed to indicate information stored during reading, was developed and analyzed in 2 studies. From these studies, it is concluded that the Chunked Reading Test is a valid test of information storage during reading in terms of its utility in measuring the differences in information stored between readers and nonreaders of passages, and that it offers many advantages over the traditional standardized reading tests.—*Journal abstract*.

5462. Darum, Annie. (National Hosp., Copenhagen, Denmark) Marianne Frostig: **Developmental Test of Visual Perception.** *Skolepsykologi*, 1969, Vol. 6(3), 194-198.—Experience shows that the test is a valuable instrument and could be used in the evaluation of school readiness. (18 ref.)—P. Mylov.

5463. Farr, Roger. (Indiana U., Inst. for Child Study, Reading Clinic) **The evaluation of reading behavior.** *Bulletin of the School of Education, Indiana U.*, 1969(Nov), Vol. 45(6), 99-111.—Despite the limitations of standardized reading tests in determining students' functional reading levels and reading skills development, the results can "be used to place youngsters in general ability level reading groups and could also be used as a screening device for students who are in need of a more extensive diagnostic evaluation."—J. Linnick.

5464. Farr, Roger & Roelke, Patricia. (Indiana U., Inst. for Child Study) **Measuring subskills of reading: Interrelations between standardized reading tests, teachers' ratings, and reading specialists' ratings.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 27-32.—Examined the convergent and discriminant validity of 3 methods for assessing 3 subskills of reading: word analysis, vocabulary, and comprehension. These 3 subskills were measured by teachers' ratings, specialists' ratings, and standardized tests. Correlations of all 3 skills, each measured by the 3 different methods, were studied by the multitrait-multimethod procedure. Although there was some support for convergent validity, the study revealed a total lack of discriminant validity for any of the 3 subskills of reading.—*Journal abstract*.

(Royal Danish Coll. of Teacher Education, Copenhagen) **Uppsalaprøven til debat.** [School-readiness testing: The Uppsala-test.] *Skolepsykologi*, 1970, Vol. 7(2), 82-105.—Criticizes investigations in school-readiness testing. Further investigations and validations are proposed before this testing is given up. (20 ref.)—P. Mylov.

5467. Hansen, Richard. (City Coll., City U. New York) **The influence of variables other than knowledge on probabilistic tests.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 9-14.—In probabil-

istic test and scoring systems the examinee is required to respond to each of the options of a multiple-choice test with a probability which represents the confidence he has in that option. It seems reasonable to assume that for such tests to yield valid information about the examinees, the knowledge they have should be the primary influence on the probabilities they assign. An attempt was made to seek the relationship between the degree to which examinees display certainty in their responses and certain personality variables. Proponents of probabilistic testing would expect such correlations to be low. In this study it was found that individuals do respond to multiple-choice questions with a characteristic certainty that cannot be accounted for on the basis of their knowledge. This certainty was related to scores of both the F Scale and the Kogan and Wallach risk-taking measure.—*Journal abstract*.

5468. Hedl, John J., O'Neil, Harold F., & Hansen, Duncan N. (Florida State U.) **The affective nature of computer-based testing procedure.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 535-536.—Studied certain affective aspects of a man-machine interaction within the context of a computer-based interactive intelligence test. Each S (N = 48 undergraduates) was tested with the WAIS, Slosson Intelligence Test, and a computer-based Slosson Intelligence Test. It was hypothesized that computer test administration would lead to lower state anxiety and higher attitude reactions in comparison with the examiner-administered tests. However, the computer testing procedures led to higher levels of state anxiety. This elevation may partly have been a function of the particular computer administration methodology.—*Author abstract*.

5469. Hendrickson, Gerry F. **The effect of differential option weighting on multiple-choice objective tests.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1971(Jan), No. 93, 47 p.—Studied whether option weighting improved the internal consistency and intercorrelation of subtests. The differential option-weighting scheme employed was based on one devised by L. Guttman. 10,000 Scholastic Aptitude Tests were 1st scored with Guttman-type weights and then with conventional correction-for-guessing weights. The internal-consistency of the tests increased markedly when Guttman-type weights were used. The correlation of the 2 verbal subtests increased somewhat when Guttman weights were used, but the correlation of the 2 mathematics subtests as well as the intercorrelation of all verbal and mathematics subtests decreased. Differences in the factor structure of the Guttman-weighted and the conventionally weighted subtests are used to explain the result. (30 ref.)—*Journal abstract*.

5470. Hill, Adrian R. (U. Strathclyde, Glasgow, Scotland) **Student selection and the M'Comisky A-C (Performance) Test.** *Educational Sciences*, 1970(May), Vol. 4(1), 31-36. Compared the accuracy performance scores obtained on the M'Comisky A-C (Performance) Test for concept attainment by 54 student-entrants on an architecture course, and the results of 3 architecture tests at the end of their 1st academic yr. It is concluded that the A-C Test is unsatisfactory as a means of student selection on the basis of architectural ability. Data showed a systematic order of concept usage. It is suggested that a weighting factor be applied in the

performance scores of less frequently used concepts. (French & German summaries) (19 ref.)—*Journal abstracts*.

5471. Hill, Adrian R. & Lau, Jackie J. (U. Strathclyde, Glasgow, Scotland) **Situational effects in using the M'Comisky A-C (Performance) Test.** *Educational Sciences*, 1970(May), Vol. 4(1), 25-30.—Investigated the effects of 2 Es, 2 rooms, and 2 sets of blocks on the accuracy performance scores obtained in the M'Comisky A-C (Performance) Test for concept attainment. Analysis of the scores of 8 female and 46 male undergraduates reveals no significant E or rooms effect, but an interaction trend suggests the presence of an E status effect. A change in sets of blocks was statistically significant. Results are discussed in the light of previous studies on situational effects. (French & German summaries) (16 ref.)—*Journal abstracts*.

5472. Hrabal, Vladimír. **Zkušenosti s českým překladem testu struktury inteligence zvláště u starších žáků ZŠ a středoškolků.** [Experience with the application of Czech translation of Ist(Amthauer) to elder pupils of elementary nine-year schools and to students of secondary schools.] *Vychovny Poradce*, 1969, Vol. 6(4), 1-12.—Describes experiences with the application of the Czech translation of R. Amthauer's Intelligence Structure Test (IST) to 8th and 9th graders of elementary schools and to students of secondary schools. Methods used were: (a) comparison of results with those obtained by the use of the other similar intelligence tests, (b) interrelation and analysis of subtests as to their objectivity and proper design, and (c) correlation of results with conventional schoolmarks. The variables were: performance levels of students; other intelligence tests, e.g., WAIS, Raven Matrices Test (RM); and subtests of the IST. Experience showed that IST generally favors high performance students and particularly, natural sciences students and mathematicians. 137 pupils from Prague schools took the IST and the average IQ for excellent, average, and below average students were 136, 124, and 81, respectively. Corresponding figures using the RM Test were 118, 114, and 97. There was a close correlation between the resulting total school marks and IST total score. Experience indicated that relation of IST to school marks is considerably closer than in RM but not so close as in WAIS. The experience obtained with the application of IST was satisfactory.—*I. Halev*.

5473. Jacobs, Stanley S. (U. Pittsburgh) **Correlates of unwarranted confidence in responses to objective test items.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 15-20.—Investigated the effects of several variables on the expression of unwarranted confidence in the accuracy of responses to objective test items. A final examination was administered to 72 Ss under confidence-weighting instructions with 2 levels of penalty for incorrect responses. A 2-way analysis of variance revealed no significant main effects or interaction attributable to level of penalty or sex. Although increased penalty level had no effect on confidence expression, the test's reliability decreased from .85 to .39, and the correlation between conventional and weighted scores dropped from .88 to .095. Confidence weighting seems to be a questionable measurement technique, since it is contaminated by individual differences in personality. This technique may, however, serve a useful diagnostic function in assessment. (22 ref.)—*Journal abstracts*.

5474. Kellogg, Richard L. (U. Rochester) **Test anxiety and the interrupted task paradigm.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3342.

5475. Kleinke, David J. (State U. New York, Albany) **A linear-prediction approach to developing test norms based on item-sampling.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3342-3343.

5476. Linn, Robert L. & Werts, Charles E. (Educational Testing Service, Princeton, N.J.) **Considerations for studies of test bias.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 1-4.—Discusses 2 problems in the investigation of predictive bias in tests: (a) the effect of unreliability of the predictors, and (b) the effect of excluding a predictor from the regression equation on which there are preexisting group differences. Hypothetical results illustrating the effects of unreliability and of a missing predictor are presented. It is suggested that computation of within-group reliability coefficients at least would enable a better evaluation of the nature and magnitude of the effect of unreliability on the within-group regression equations. It is also pointed out that all variables that are used as predictors for the selection decision should be considered when predictive bias is investigated.—*Journal abstracts*.

5477. Meernhout, M. F. (U. Congo, Lab. of Psychology & Labor Study, Kinshasa, Republic of Congo) **Valeur du test D.48 appliqué en sixième Primaire au Congo-Kinshasa.** [Value of the D.48 test applied in the 6th primary class in Congo-Kinshasa.] *Bulletin de Psychologie Scolaire et d'Orientation*, 1970(Sep), Vol. 19(3), 130-134.—Administered the Dominoes Test (D.48), an intelligence test in its standard form, to 366 11-17 yr. old Congolese boys during a school year. Prolonging testing time by 10 min. (35 instead of 25 min.) did not result in significantly improved performance. Results were slightly lower than those obtained previously by R. G. Doutrepoint on 794 Belgian 5-14 yr. old boys and girls, but agree with those of J. P. Lejeune on 286 Belgian boys and girls of the 6th primary class as to better results in the older age groups. A metric adaptation of the D.48 is seen necessary before its true value and practicability can be realized outside its validation milieu. (English summary)—*T. N. Webster*.

5478. Menne, John W. & Tolsma, Robert J. (Iowa State U.) **A discrimination index for items in instruments using group responses.** *Journal of Educational Measurement*, 1971(Spr), Vol. 8(1), 5-7.—Stresses the need for discriminative items in evaluative instruments using group responses. It is argued that the percentage of the total sum squares due to "between groups" is an appropriate index of item discrimination. The within-group variance should, however, be low in relationship to the between-group variance. A distinction is made between the measurement of group responses and the measurement of individuals. In the latter case the total score based on 30 or more modestly discriminating items is considered essential; in the measurement by group responses, items scores are regarded as more important and the scale scores are generally based on only 5-15 items.—*S. B. Mitra*.

5479. Meuris, G. (Catholic U., Louvain, Belgium) **La mesure de l'aptitude verbale chez les écoliers de 12 à 18 ans: Un test de compréhension verbale.** [Measuring verbal ability in students 12 to 18 years of age: A test of verbal comprehension.] *Information Psychologique*, 1970(Jan), Vol. 10(37-38), 49-60.—After

a brief historical introduction, describes the construction, item analysis, and validation of a multiple-choice vocabulary test. Results are reported of a factor analytic study of 8 ability tests: verbal, number, spatial reasoning, letter series, verbal reasoning, numerical reasoning, and spatial reasoning.—S. G. Vandenberg.

5480. Moore, George C. & Falls, Harold B. (U. Arkansas) **Functional classification for physical education in the upper elementary grades by peer assessment.** *Research Quarterly*, 1970(Dec), Vol. 41(4), 519-522. Investigates a paper and pencil peer rating of physical performance (Physical Performance Scale) for reliability and validity using 538 5th and 6th grade boys and girls as Ss. Test-retest reliability was high. Correlation coefficients were .812 for 5th graders and .879 for 6th graders. To determine validity, Pearson r's, analysis of variance, and biserial correlation were used. The criterion used for validating the scale was average T scores on selected American Association for Health, Physical Education, and Recreation Youth Fitness Test items. The scale demonstrated good validity for discriminating between high and low levels of physical performance as determined by the Youth Fitness Test scores. In addition, when the Ss were grouped according to average physical performance T scores, the mean peer rating scores were significantly different among the groups.—*Journal abstract*.

5481. Nighswander, James K. (Southern Illinois U.) **A validity study of self-report and physiological measures of test anxiety.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3346-3347.

5482. Phillips, Beeman N. (U. Texas) **School stress as a factor in children's responses to tests and testing.** *Journal of Educational Measurement*, 1971(Spring), Vol. 8(1), 21-26. Response styles are conceptualized as stress reactions, and the stressful school experiences of acquiescent, negativistic, self-enhancing, and self-derogating children were studied. School interpersonal stress was lower among acquiescent than negativistic Ss, while school academic stress was higher among self-enhancing than self-derogating Ss. 1 of the major implications of the conceptual approach and empirical results is that tests might be generally improved by identifying the kinds of stressful experiences Ss have had, and relating these to the kinds of responses Ss make to tests and testing. In addition, while the importance of the reaction of Ss to the measuring process is generally accepted, much more needs to be done on the kinds of responses individuals make to the content, in comparison to the conditions, of testing. Finally, these observations are particularly pertinent to tests and testing in schools, especially when the teacher is involved in the process and makes tests and testing stressful. This will tend to increase the effects of response style tendencies and decrease the validity of tests. *Journal abstract*.

5483. Pugh, Richard C. **Tests for creative thinking-potential for school testing programs.** *Bulletin of the School of Education, Indiana U.*, 1968(Nov), Vol. 44(6), 1-30.—The Torrance Tests of Creative Thinking (TTCT) 1-30.—The Torrance Tests of Creative Thinking (TTCT) contain verbal and figural activities which can be administered to any school-age children. It is recommended that the verbal test be administered on an individual basis below the 4th grade. Torrance's assumption is that "in order for creativity to be viewed scientifically, it must be defined in a way that permits

objective observation and measurement and in terms that are compatible with common usage." The rationale for the scores—entitled fluency, flexibility, originality, and elaboration—is briefly described. Analysis of research points up the "usefulness of the TTCT in a school testing program," but further exploration is necessary. "The relationship with existing commonly-used measures of achievement and intelligence seems to be following a pattern of low, positive correlation.—I. Linnick.

5484. Rosina, Jozef. (Komenský U. Pedagogical Faculty, Trnava, Czechoslovakia) **Hodnotenie a klasifikácia žiakov ako motivačné činitele.** [Evaluation of the pupils' progress and marking as factors of motivation.] *Jednotná Škola*, 1969(Nov), Vol. 21(9), 814-827.—Discusses the motive function of evaluation and marking. A survey of the factor analysis of school proficiency is reported which concludes that in the case of normal pupils basic mental aptitudes play an insignificant role in proficiency. The decisive factor is described as a "halo effect" representing a set of intellectual and extraintellectual factors. The pupil's activity and his attitude to learning are seen as conditioned by social and individual motivation. Among the significant motives for learning are the satisfaction of the need to know, self-expression, need for companionship, safety, desire for beauty, and freedom. Evaluation and marking in schools are closely linked with the satisfaction of these needs. Favorable praise is considered to have a generally positive motivating effect, whereas negative evaluation may have a favorable effect in small quantities, but large quantities lead to permanent frustration of self-expression. The question of fair evaluation and marking are discussed. (Russian summary)—*English summary*.

5485. Tillman, M. H. & Veal, I. Ramon. (U. Georgia) **Systematic errors in rating the quality of themes varying in mode of discourse and grade level.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 131-136.—Developed theme models for assessing quality of writing within 4 modes of discourse: argumentative, descriptive, expository, and narrative. Compositions were obtained in each of the modes at Grades 2, 4, and 6. Using the model themes, 3 raters rated all themes. Analysis of variance was performed to locate sources of systematic rater error within the context of these rating procedures. At Grade 6, a rater leniency error was found, perhaps reflecting that raters tended to equalize time actually spent in rating themes without proper regard to the time needed to rate themes. It is suggested that rater attitude toward models and the subsequent ratings be emphasized. It is noted that the use of different mode models did not affect the variation among raters.—*Journal abstract*.

SPECIAL EDUCATION

5486. Axelrod, Saul. (U. Connecticut) **Token reinforcement programs in special classes.** *Exceptional Children*, 1971(Jan), Vol. 37(5), 371-379. Reviews token reinforcement programs in the special education classroom and indicates that positive results were almost invariably obtained, even with different types of target behaviors and various kinds of populations, including handicapped teenagers, urban underachievers, dropouts, the learning and reading disabled, and the emotionally disturbed. It is suggested that ways be devised of

withdrawing tokens without interruption of progress and that greater use be made of reinforcers already existing in the classroom.—*Journal abstract.*

5488. Gaskins, A. Irene. (U. Pennsylvania) **Characteristics that differentiate dyslexics from non-dyslexic poor readers.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3336.

5489. Glavin, John P., Quay, Herbert C., & Werry, John S. (Temple U.) **Behavioral and academic gains of conduct problem children in different classroom settings.** *Exceptional Children*, 1971(Feb), Vol. 37(6), 441-446.—Presents a 2-yr research study which was completed with conduct problem children who presented severe difficulties in the public school system and were placed in experimental special classrooms. In the 1st yr. (1967) the program emphasized the elimination of grossly deviant behaviors and the acquisition of attending behaviors as precursors for academic gain. Program emphasis was changed the 2nd yr. (1968) to stress rewards for academic performance. Attractive reinforcers were attached to appropriate academic tasks in the context of a highly structured classroom program. A comparison of the academic and behavioral results of the 2 yr. is presented and discussed.—*Journal abstract.*

5490. Grossman, Arnold H. (New York U.) **Problem tendencies in children and types of behavior problems manifested by children deemed acceptable as campers in organized resident summer camps as reported by camp directors.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3360.

5491. Kotzé, J. M. (U. Pretoria, South Africa) **Die opvoeding van die breinbeskadigde kind as orthopedagogiese opgaawe.** [The upbringing of the brain-injured child as orthopedagogical task.] *South African Journal of Pedagogy*, 1969(Jul), Vol. 3(1), 49-62.—Distinguishes between the orthopedagogic task as an application of collected data taken from other sciences and as a genuine pedagogic concern. It is stressed that orthopedagogy must always be grounded in theoretical pedagogy, promoting guidance of the child toward responsible self-determination. In regard to the brain-injured child, the pedagogue is urged to understand the child's world, accept that he constitutes different relationships toward reality, and help him accept his limitations. (English summary) (56 ref.)—P. Hertzberg.

5492. Nel, B. F. (U. Pretoria, South Africa) **Die orthopedagogiek as wetenskapsgebied van die pedagogiek.** [Orthopedagogy as a field of the science of pedagogy.] *South African Journal of Pedagogy*, 1969(Jul), Vol. 3(1), 1-21.—Reviews the history of orthopedagogy, noting that classes and schools for deviate children were not established until the end of the 18th century. Orthopedagogy is regarded as an inseparable part-science of pedagogy in which the handicapped child necessitates a different pedagogical approach. The importance of the pedagogue-teacher in regard to influencing a handicapped child's person-image and acceptance of his handicap is stressed with regard to a fundamentally pedagogical aim. Phenomenological analysis of the child in his situation is considered essential to orthopedagogy. In this approach, communication, en-

counter, dialogue, and observation are considered essential methods. (English summary) (31 ref.)—P. Hertzberg.

5495. Szabó, Pál. (Library of the State Inst. of Hygiene, Budapest, Hungary) **Komplex vizsgálati módszer és rehabilitációs eljárás iskolaéretlen gyermekeknél.** [A complex method for the examination of scholastically immature children and their rehabilitation.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 208-221.—Reports experiments designed to find effective procedures for the rehabilitation of scholastically immature children while keeping them in school. Experimental classes of 15 children each were organized for Ss selected by a complex examination. Teacher, physician, psychologist, and logopedist cooperated during the course of rehabilitation which enabled the majority of the Ss to cope with the class curriculum without impairing their health. "Doubly handicapped" Ss, i.e. Ss born prematurely, with prenatal injury, or afflicted by other adverse circumstances were an exception. Such Ss did not profit by the special teaching program. For them the organization of a preparatory class was considered advisable. The experiment has been planned to take 3 yr. Experiences of the 1st yr. are reported. (Russian summary)—*English summary.*

5496. Truex, Milton H. (Case Western Reserve U.) **A study of gains from pre and early elementary compensatory training.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3357-3358.

5497. Vliegthart, W. E. **Het veld der orthopedagogiek.** [The terrain of orthopedagogy.] *South African Journal of Pedagogy*, 1969(Jul), Vol. 3(1), 22-29.—Orthopedagogy is viewed as "the study of the orthopedagogical in respect of the child who, as a result of his own psychic and organic structure, provides serious hindrances to his normal upbringing." It is stressed that the boundary between orthopedagogy and pedagogy is vaguely defined and diversified according to types of defects, i.e., blindness, deafness, etc. Advice for orthopedagogues and teachers in special education is included. (English summary)—P. Hertzberg.

5498. von Hilsheimer, George. (Summerland, Buck Brook Farm, Roscoe, N.Y.) **The teacher as a human engineer.** *Academic Therapy*, 1970-1971(Win), Vol. 6(2), 135-149.—Emphasizes that behaviorism is more than simple reward-punishment conditioning and gadgetry. 22 techniques are described for teaching skills and behavior. The indications and contraindications for each are noted. The techniques are: (a) counting, (b) dissonance, (c) negative instruction, (d) negative practice, (e) disarming, (f) assertion training, (g) motor-verbal interaction, (h) escape conditioning, (i) health and body awareness with the aid of adequate medical inventories, (j) psychokinetics, (k) relaxation, (l) sleep regulation, (m) feedback, (n) exorcism, (o) operant conditioning, (p) precision training, (q) moral therapy, (r) cognitive therapy, (s) terror relief, (t) traumatic conditioning, (u) radicalized environment, and (v) existential democracy. (41 ref.)—S. Knapp.

Gifted

Remedial Education

5499. Griffiths, Anita N. (Griffiths Guidance, Lakeland, Fla.) **Self-concept in remedial work with dyslexic children.** *Academic Therapy*, 1970 (Win), Vol. 6(2), 125-133. Presents conclusions derived from remedial work with 32 and 28 6-15 yr. old dyslexic boys and girls. Pre- and posttesting with the Marianne Frostig Developmental Test of Visual Perception, the Gilmore Oral Reading Test, the WISC, and a personality checklist indicated an improvement in all areas. Behavior at home and at school also indicated improvement. Attitudes of teachers, counselors, therapists, parents, and children are discussed in relation to their effect on the child's self-concept. It is concluded that while the behavior modifiers are useful and effective, the manipulation of the child incurs resentment, and indicates and teaches a lack of trust. The danger of self-fulfilling prophecies with regard to these children is noted. The helping attention which focuses on trust, positive attitudes, and empathy is recommended. Since the tests of these children indicate many differences, remedial sessions should be individually administered, avoiding as much as possible all situations and materials which have come to be associated with failure. A general outline of techniques and procedures is presented.—S. Knapp.

5500. Lane, Patrick R. (Maimonides Medical Center, Community Mental Health Center, Brooklyn, N.Y.) **Educational therapy for adolescent nonreaders.** *Academic Therapy*, 1970-1971 (Win), Vol. 6(2), 155-159.—Describes a remedial reading program and its use with 11 nonreading 7th-8th grade boys. The program utilized "a gradual progression of phonic skills with strong reinforcements of learning, major use of linguistic word patterns, and a minimizing of contradiction in sounds of letters." After 4 mo. of instruction, the average group improvement was 12 mo. with some Ss showing as much as 2 yr. and 5 mo. 2 Ss who did not significantly improve were tested and revealed severe learning disabilities. 7 other Ss showed perceptual problems. Behavioral improvement and improvement of self-image were marked. Development of a reader using slang and pictures of teenagers is noted.—S. Knapp.

5501. Raymer, Donna R. (Northwestern U.) **A study of compensatory education for "high risk" college students.** *Dissertation Abstracts International*, 1971 (Jan), Vol. 31(7A), 3377.

5502. Silberberg, Norman & Feldt, Leonard S. (Kenny Rehabilitation Inst., Minneapolis, Minn.) **Intellectual and perceptual correlates of reading disabilities.** *Skolepsykologi*, 1970, Vol. 7(2), 67-81. Investigated the psychometric configurations on the WISC and Bender-Gestalt Test for 6 groups of primary grade pupils with reading problems. Pattern analysis provided virtually no clues as to the nature or extent of reading disability, either for the group as a whole or within a single grade (16 ref.).—*Journal abstract*.

5503. Sonnekus, M. C. (U. Pretoria, South Africa) **Die vraagstuk van "remedierende" onderwys as ortopedagogiese aangeleentheid.** [The problem of "remedial" teaching as orthopedagogical concern.] *South African Journal of Pedagogy*, 1969 (Jul), Vol. 3(1), 30-48. Asserts that the current approach to remedial teaching is directed to the diagnosis and treatment of symptoms. This practice of error-analysis is criticized for eliminating causes of errors as well as the errors

themselves. A child with learning difficulties is considered to be an orthopedagogical concern, and as such, the final objective is to realize his educationality to its full potential. An orthopedagogical orthopedagogical diagnosis to determine the level of what has been pedagogically achieved in relation to what can still be achieved is suggested. A child's learning image is considered to be his experience image. (English summary) (37 ref.)—P. Hertzberg.

Sensory & Physical Handicaps

5504. Chovan, William L. (Western Carolina U.) **Vocal labels and characteristics of recall in an object arrangement task with deaf and hearing children.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971 (Vol. 66 Pt. 2), 547-548. Investigated the effects of vocal labels on memory using an object task. The 60 deaf and 30 hearing Ss were divided into 2 MA levels: primary (below 7) and intermediate (above 7 = MA). Within each level, Ss were assigned to treatment. When the groups were viewed in terms of levels, there were significant differences between intermediate and primary deaf and hearing groups. At both the primary and intermediate levels, there were no significant differences between Ss with vocal labels and without vocal labels. Results suggest that the availability of additional modes of mediation accounted for differences between the primary and intermediate levels.—*Author abstract*.

5505. Gore, George V. **The effects modes of oral presentation have on certain cognitive skills.** *New Outlook for the Blind*, 1970 (Mar), Vol. 64(3), 86-88.—Discusses the difficulties of the visually handicapped student in a local public school due to the fact that his mode of reading requires so much more time. An investigation is described in which students listened to recorded material which had been compressed or accelerated to a 5% increase over the original time. "The compressed mode and the normal mode of presentation were significantly superior to the accelerated mode for both comprehension and recall." Results of a statistical analysis of the data are shown. "Plain sense comprehension comprised 35% of the text material used; interpretation comprised 40% and evaluation and application 25%." There were "significant differences in comprehension and recall scores among the modes of oral recorded presentation" and these differences depended on the learning skill being examined. Compressed and normal modes showed superiority to the accelerated mode when the interpretation skill area was measured. It is suggested that if the student could vary the speed of compression, the results of measuring comprehension and recall might become more meaningful.—B. A. Burkard.

5506. Hanninen, Kenneth A. (Wayne State U.) **The effect of texture on tactual perception of length.** *Exceptional Children*, 1970 (May), Vol. 36(9), 657-672.

Tested 29 blind and 28 sighted elementary and junior high school students in 2 local public schools and 2 residential schools for blind for the effect of coarse and fine texture on their ability to judge the lengths of abrasive paper presented individually. It was predicted that Ss would underestimate the coarse textures and overestimate the fine textures when stimuli were presented successively for tactual exploration. Results do not support the predicted bias in judgment of length.

however, analysis of the errors to criterion in training support the idea that texture consistently facilitated or interfered with making judgments of length. Implications for tactile displays in classrooms for blind are suggested.—*Journal abstract.*

5507. Kluge, Karl J. (98 Schneiderstr., Dortmund, W. Germany) **Das Essener Modell: Eine Form der auserschulischen Sonderpädagogik.** [The Essen model: A form of extracurricular special education.] *Heilpädagogische Werkblätter*, 1970(Nov), Vol. 39(6), 293-301.—Based on sociogram and interview results which showed that handicapped children feel socially isolated during school activities, groups of such children were formed under the auspices of the Catholic Scout Movement in Essen, W. Germany. Special education children participated actively in normal groups after the leaders had received intensified training in handling these children.—*R. F. Wagner.*

5508. Lowenbraun, Sheila & Affleck, James Q. (U. Washington, Coll. of Education) **The ability of deaf children to use syntactic cues in immediate recall of speechread material.** *Exceptional Children*, 1970(Sum), Vol. 36(10), 735-741.—Investigated the ability of 41 profoundly deaf children (CA 6-13.11) to use grammatical cues in the oral reproduction of speech-read material. Shifting patterns of significant results on the indicator variables of number of omissions, additions, substitutions, and word order reversals; correct reproduction; and length of production proved in part the hypothesis that grammatical structure influences the ability to reproduce speech-read material.

5509. Moores, Donald F. (U. Minnesota) **An investigation of the psycholinguistic functioning of deaf adolescents.** *Exceptional Children*, 1970(May), Vol. 36(9), 645-652.—Investigated the ability of cloze procedures to assess morphologico-syntactic and semantic differences between deaf and hearing groups matched on reading achievement scores. 37 students, average age 16.10, mean grade reading score 4.77 on the Stanford Achievement Test, and attending a residential school for the deaf served as Ss. The control group, 37 4th and 5th grade hearing children, had a mean reading score of 4.84 and an average age of 9-10. Passages of 250 words were developed from 4th, 6th, and 8th grade textbooks. The performance of the hearing Ss was superior on all measures for each passage, supporting the thesis that standardized tests spuriously raise estimates of reading ability of the deaf and that the relative inferiority of the deaf can be traced to both grammatical and semantic inadequacies. The sensitivity of cloze procedures was established and future applications of the technique discussed.—*Journal abstract.*

5510. Stone, Martin C. (Rosedale Cerebral Palsy Developmental Training Center, White Plains, N.Y.) **Behavior shaping in a classroom for children with cerebral palsy.** *Exceptional Children*, 1970(May), Vol. 36(9), 674-677.—Describes a behavior shaping technique based on reinforcing or rewarding the desired response and not rewarding the inappropriate one. 7 7-9 yr. old boys with low IQs and a diagnosis of cerebral palsy with possible diffuse organic brain damage were placed in a special class where appropriate classroom behavior and learning were rewarded for a 1-yr period. The outcome, based upon observation, showed overall improvement in behavior patterns. However, the Ss needed continually tangible rewards to motivate their learning.—*P. Hertzberg.*

5511. Vernon, McCay. (Western Maryland Coll.) **The role of deaf teachers in the education of deaf children.** *Deaf American*, 1970(Jul), Vol. 22(1), 1-20.—Reports that the deaf teacher, like the deaf child, has in some respects been shortchanged by the "education of the deaf." It is happening and has happened at every level from the Bureau of Education of the Handicapped to the local school that requires normal hearing for teachers of deaf children. The role of Gallaudet College in this area has been mixed. Major improvements have for the most part come from member groups of the National Association of the Deaf in their attempts to open schools to the use of deaf teachers. In the final analysis other improvements must depend in large part upon the knowledge and effective political action of the deaf community. As an integral part of this community and the hope of the future, Gallaudet must be at the forefront of such action. Programs for political action are suggested. (20 ref.)—*Journal summary.*

Mental Retardation & Learning Disorder

5512. Adelman, Howard S. (U. California, Riverside) **Learning problems: I. An interactional view of causality.** *Academic Therapy*, 1970-1971(Win), Vol. 6(2), 117-123.—Presents definitions of learning disabled (LD), emotionally disturbed (ED), and educational handicapped (EH) children. Conceptualizations of the child and of the classroom situation are discussed. It is hypothesized (a) that within the populations labeled LD, ED, and EH are "at least 3 major subgroups of youngsters with learning or behavioral problems or both, ranging from those youngsters whose problem seems to stem primarily from the deficiencies of the learning environment to those who actually have major disorders that interfere with school learning or performance, or both; and (b) that there is a significant relationship between teachers' ability to personalize instruction and the type and relative proportion of the problem-youngsters who are likely to be found in these teachers' classrooms."—*S. Knapp.*

5513. Auxter, David. (Slippery Rock State Coll.) **Reaction time of children with learning disabilities.** *Academic Therapy*, 1970-1971(Win), Vol. 6(2), 151-154.—Compared the visual and auditory RT and speed-of-limb movement of 17 normal and 18 learning disabled 68-76 mo. old children. No significant differences were found between the groups in visual and auditory RT. The normal Ss performed significantly better than the learning disabled group at the 0.5 level of confidence. Analysis of the speed-of-limb task indicates that the disabled Ss had difficulty in shifting "vision" from 1 area to another for a hand-eye match or limited ability to structure the space field that encompassed the perceptual-motor task."—*S. Knapp.*

5514. Bach, Heinz. (U. Mainz, W. Germany) **Die Psychomotorische Erziehung unter besonderer Berücksichtigung geistigbehinderter Kinder.** [Psychomotor education under special consideration of mentally retarded children.] *Heilpädagogische Werkblätter*, 1970(Nov), Vol. 39(6), 272-273. Psychomotor education in mentally retarded children has 3 major goals: (a) exploration of the child's world (environment) through experiencing form, space, direction, etc. (b) assistance for life endurance, experienced through coordination, rhythm, and variety of movement, and (c)

reduction of maladjusted behavior, e.g. overcoming inhibitions, anxieties, or neurotic disturbances. Since in the retarded child the motor forms of conceptual thinking are dominant, their education in the sense of spiritual (cognitive) awakening becomes identical with psychomotor education.—R. F. Wagner.

5515. Chasey, William C. & Wrick, Wancea. (Texas) Effects of a physical developmental program on psychomotor ability of retarded children. *American Journal of Mental Deficiency*, 1971(Mar), Vol. 75(5), 566-570.—The Oseretsky Tests of Motor Proficiency were administered to 27 73-146 mo. old educable mentally retarded (EMR) children before and after participating in a 15-wk physical developmental program, and to 20 EMR children not enrolled in the developmental program. A comparison of pre- and postprogram performances on the Oseretsky tests indicated that (a) EMR children receiving a concentrated physical education program improved significantly in the gross motor skill components of the Oseretsky tests, and (b) these improvements resulted in the experimental EMR group surpassing the control group on the majority of items of the posttest. (19 ref.)—*Journal abstract.*

5516. Flynn, Tim M. & Flynn, Lynda A. (Florida State U.) The effect of a parttime special education program on adjustment of EMR students. *Exceptional Children*, 1970(May), Vol. 36(9), 680-681.—Attempts to determine if the personal and social adjustment of educable mentally retarded (EMR) Ss in a regular elementary class is improved by placement in a parttime special education program. Ss were 61 EMR students enrolled in special education, 61 EMR students waiting for placement in a special education program, and 61 normal students. Ss were tested on a School Adjustment Scale (SAS) which consisted of 30 classroom situations with a choice of 5 possible behaviors for each. Special class Ss did not score significantly higher than waiting list Ss on the SAS. Reasons for this unexpected result are discussed.—P. Hertzberg.

5517. Forer, Ruth K. (California, Los Angeles) Time understanding of normal achieving and educationally handicapped boys. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3371.

5518. Forness, Steven R. & Weil, Marvin C. (California Neuropsychiatric Inst., Los Angeles) Laterality in retarded readers with brain dysfunction. *Exceptional Children*, 1970(May), Vol. 36(9), 684-695.

26 boys from a perceptual motor training program were given the Gray Oral Reading Paragraphs, the Peabody Picture Vocabulary Test, and the Harris Tests of Lateral Dominance. 17 Ss had normal verbal intelligence but were retarded in reading. 13 of these had a diagnosis of minimal brain dysfunction. Ss with brain dysfunction were also found to have a high incidence of crossed dominance which appeared to be a function of left eyedness. More severely disabled Ss (reading retardation ≥ -3 yr.) had a definite tendency to be left eyed.—P. Hertzberg.

5519. Hathaway, Mildred L. (Case Western Reserve U.) A verbal learning study using the three-stage chaining paradigm. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3339.

5520. Helms, Harold B. An auditory approach to learning number facts. *Academic Therapy*, 1970 (1970Win), Vol. 6(2), 217-218.—Describes the use of a tape recorder in teaching a youngster with both reading

and number dysfunctions. The auditory approach seemed to relieve some of the anxieties associated with learning and provided an opportunity for successful learning without pressure.—A. Kopp.

5521. Keesey, Merle A. (Oregon) The effects of two types of pretraining of the paired associate learning performance of retarded and non-retarded children. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3374.

5522. Maycock, George A. (Texas Tech U.) Emotional, social, and academic adjustment of the mentally retarded as related to socio-economic level. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3375.

5523. Murdoch, John B. (Adelphi Home for Children, Rhinebeck, N.Y.) Effect of stress on perceptual-motor functioning of adolescents with learning difficulties. *Perceptual & Motor Skills*, 1970(Dec), Vol. 29(3), 883-886.—Analyzes the Bender Visual Motor Gestalt (B-G) scores of 69 adolescents enrolled in a residential treatment center for the effects of stress upon perceptual-motor functioning. All Ss had been tested twice with the B-G, once at preplacement (designated the stressful condition) and upon leaving, no following enrollment. Results indicate that Ss tend to make fewer errors on the 2nd administration. Only in those Ss diagnosed as brain-impaired, however, did this difference reach conventional levels of statistical significance.—*Journal abstract.*

5524. Morris, James C. (Utah State U.) Parent training in precise behavior management with mentally retarded children. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3376.

5525. Reger, Roger & Kuppman, Marion. (Board of Cooperative Education Services, Buffalo, N.Y.) The child oriented resource room program. *Exceptional Children*, 1971(Feb), Vol. 37(1), 40-46.—Describes a program in which 19 school districts in the Buffalo, New York area established resource rooms which included special education classes for children exhibiting as special needs. The program was designed to help children with learning disabilities. A child evaluation center to help children from regular classes was also established. The program was generally considered to be successful.—P. Hertzberg.

5526. Rucker, Chauncey A. & Vincenz, Filomena M. (I.) Confronting Maintaining social acceptance gains made by mentally retarded children. *Exceptional Children*, 1970(May), Vol. 36(9), 696-698.

Investigates the permanence of gains made by 95 educable mentally retarded (EMR) students in an extension of a study by M. Chennault (see PA, Vol. 42, 7746) in which the social acceptability of EMR students was increased by placing them with normal students in a class. Ss were given the Ohio Social Acceptance Scale (OSAS) as a pre-post, and post-posttest measure. Ss in the experimental condition put in a carnival fun their class, while control Ss served as controls. OSAS results show a significant difference in social acceptance between the 2 groups for the pre- and posttest comparison, but not for the pre- and post-posttest comparison (1 mo. later). This indicates that the acceptance of EMR Ss can be enhanced for a period when treatment ceases.—P. Hertzberg.

5527. Sabatino, David A. & Harden, David L. (Pennsylvania State U.) Information processing behaviors related to learning disabilities and educable

mental retardation. *Exceptional Children*, 1970(Sep), Vol. 37(1), 21-29. All the elementary school age children failing in a county school system were administered a battery of psychoeducational tests to determine their information processing behaviors. Of the 472 Ss who successfully completed audiometric and visual screening and had no school record or medical history of acute physical, chronic health, or social personal problems, 1 group (N = 185) had average and above verbal intelligence. These Ss were considered to have learning disabilities on the basis of their perceptual deficits. The remaining Ss with below average intelligence (educable mental retardation) seemed to work to predicted grade equivalent in some academic achievement areas. The principal components obtained from an orthogonal rotation of the behavioral variables indicate that these 2 S groups had many similar perceptual and language deficits, but decided behavioral differences. *Journal abstract*

5528. Salvador, Virginia M. (U. Oregon) **Role expectations for the teacher of secondary educable mentally retarded as held by counselors, administrators and teachers of the retarded.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3377-3378.

5529. Sallia, John & Shugerts, James. (U. Illinois) **Color related behavior of mentally retarded children with color blindness and normal color vision.** *Exceptional Children*, 1970(Sep), Vol. 37(1), 37-38.

Tested 2 groups of children (retarded color blind, and retarded with normal color vision) in 3 ways: (a) color matching tasks (5 single and 5 multiple colored) using a "match to sample" format, (b) the Dvorine Pseudo-Isochromatic Plates, and (c) the Word-Color Association Test. It was found that the 2 groups did not differ significantly on the number of correct word color associations or on the color matching task. Findings imply "that in a low educable classroom the beginning performance on word color association, simple color matching, and simple color naming are likely to be similar for color blind and normal color vision children."—P. Hertzberg.

5533. Kravetz, Richard J. & Forness, Steven R. (U. California, Graduate School of Education, Los Angeles) **The special classroom as a desensitization setting.** *Exceptional Children*, 1971(Jan), Vol. 37(5), 389-391. —Describes the use of a desensitization technique in which a boy, hospitalized for fear of speaking, received checkmarks for following classroom behavioral rules and

doing the work. The checkmarks were exchanged for candy or toys at the end of each week. The E formulated an individualized hierarchy of fearful situations for which adaptive responding was reinforced. The last step of the hierarchy was reached in 6 wk. Desensitization was considered successful for the S in this case, and is suggested in areas where generalization of learned responses is critical.—P. Hertzberg.

COUNSELING & GUIDANCE

5534. Anderson, Edward C. (U. California, Los Angeles) **Promoting career information-seeking through group counselor's cues and reinforcements.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3257.

5535. Anderson, Wayne & Kutzen, Neil. (U. Missouri) **Size and confidentiality policies of college counseling centers.** *Journal of College Student Personnel*, 1971(Mar), Vol. 12(2), 130-132. —Investigated the relationship between size, religious affiliation, and administrative organization with confidentiality of records by college counseling centers based on the results of a 26-item questionnaire completed and returned by 219 (67.5% of the sample) institutions. Compared to an earlier study, the findings indicate a greater tendency to keep records confidential, at least within the center itself (by some 78% of the respondents). The larger the institution, the greater the likelihood that confidentiality is maintained. The smaller institutions tended to make information more available to personnel outside of the center, regardless of the affiliation of the institution. No significant relationship was found to exist between the degree of confidentiality of the records and the status of the counseling center in the institution. R. H. Mueller.

5536. Backner, Burton L. (Queens Coll., City U. New York) **Counseling black students: Any place for whitey?** *Journal of Higher Education*, 1970(Nov), Vol. 41(8), 630-637. Investigated the ability of white counselors to work with black and Puerto Rican students. Questionnaires were completed by students in a special educational program for minority groups. 115 Ss in the program and 14 dropouts completed the 1st questionnaire; 174 Ss completed the 2nd questionnaire; and 30 Ss completed the final questionnaire. Findings indicate that the majority of the Ss considered the racial or ethnic background of their counselor as irrelevant. Those Ss who did think it was important indicated that this attitude was a product of the student's feeling about the counselor as a person rather than as a white. It is concluded that while such programs should have a majority of black and Puerto Rican counselors, white counselors can work with minority groups better than has been assumed. S. Knapp.

5537. Bailey, Roger L. (U. Kansas) **A canonical correlation analysis to the Basic Interest Scales and the Edwards Personal Preference Schedule: A test of Holland's theory.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3259.

5539. Barnett, Rosalind. (Harvard U.) **Personality correlates of vocational planning.** *Genetic Psychology Monographs*, 1971(May), Vol. 83(2), 309-356.—Hypo-

esized that: (a) senior-level college women, at different stages of psychological development, think and act differently toward their future careers; and (b) vocational planning is related systematically and predictably to other behaviors and attitudes. Vocational planning refers here to specific patterns of behavior in the vocational decision-making situation. 3 behavior patterns were defined by combinations of scale scores on 2 variables measuring psychological aspects of vocational planning: commitment and implementation. Directional hypotheses were developed relating the pattern groups to 4 clusters of psychological and sociological attributes: demographic, personal system, family structure, and current social structure. Data indicate that the groups were quite homogeneous with respect to a broad array of variables. Accurate postdictions were made as to a wide range of experiences, behaviors, and attitudes. Predictions regarding the stability or change of vocational plans over a 5-mo period were confirmed. (22 ref.)—*Author abstract.*

5540. Blaškovič, Oskár. (Research Inst. of Pedagogy, Bratislava, Czechoslovakia) *Koncepcia obsahu gymnázia a niektoré otázky školského psychologického poradenstva.* [Conception of grammar schools and some questions related to psychological advisory system.] *Jednotná Škola*, 1969(May), Vol. 21(5), 441-447.—Suggests that the new conception of grammar schools can create suitable conditions for the improvement of the preparation of students for further study and for selection of a profession. Problems connected with the structure and content of teaching and their role in the professional development and maturing of pupils, and in professional information and orientation in general, are discussed. The need for an expansion of the psychological services in the schools is emphasized. (Russian summary)—*English summary.*

5541. Booyesen, F. C. 'N ondersoek na 'n pedagogiesverantwoorde stelsel van loopbaanstudie deur leerlinge: 'N studie in beroepsoriëntering. [A pedagogically motivated system of career study by pupils.] *Opvoedkundige Studies*, No. 56, 108 p.—Proposes that introduction to the vocational world must be regarded as a formative accumulative process, which starts in the family situation. In the primary school this continues and the task of the orientator is to help the child with the correct choice of school, subjects, and fields which will be in keeping with the future choice of a career. Through continual self-evaluation and career studies the child will be able to develop a clearer perspective of his future. The use of exploratory media to assist the child in the development of this perspective is discussed. The integration of the self-image and a vocational image is considered the goal. Recommendations for changes in the present guidance system, selection and training of orientators, and new facilities are presented. (English summary) (10 p. ref.)—*S. Knapp.*

5542. Bredenkamp, J. F. 'N ondersoek na die betekenis van die Zulliger tafeln medium by die beroepskeuse van jeugdiges. [An investigation of the significance of the Zulliger medium in the vocational choice of juveniles.] *Opvoedkundige Studies*, No. 58, 131 p.—Defines the concept of projection and describes the Zulliger-Tafeln-Medium (Z-medium), a 3 plate Rorschach-type test. The symptom values of the Z-medium interpretations are considered for (a) answering time; (b) number of answers; and (c) the apperception, qualitative, content, and wider interpretive calculation

columns. Implications for vocational choice in the Z-medium interpretations are noted. It is concluded that the Z-medium may be useful in obtaining information about a subject where other media have failed. (English summary) (93 ref.)—*S. Knapp.*

5545. Chapman, James L. (West Liberty State Coll.) *Development and validation of a scale to measure empathy.* *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 281-282.—Developed and validated an instrument that tested an S's ability to identify the emotion or emotions expressed by another. Ss were 53 university students and 88 enrollees in National Defense Education Act Summer Institutes. The instrument was composed of selected scenes of videotape recordings of counseling interviews. Ss responded to each adjective on a continuum indicating how strongly they possessed the feeling described by the adjective at the end of each scene.—*Journal abstract.*

5546. Cohen, Daniel. (Pace Coll.) *Differentiating motivations underlying vocational choice.* *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 229-234.—Determined whether or not expressed motivations for curricular choice would discriminate between college seniors in business administration and in teacher education. A list was compiled of all motivations expressed by 504 randomly selected male undergraduates. After eliminating duplications, 289 items were selected, weighted, and combined into a questionnaire with a 5-point intensity scale. The t ratio and factor analysis were used to isolate the common underlying "teacherness" and "businessness" within groups. Major significant factors ($p < .001$) were then programmed into the discriminant analysis. The factor weights of 2 important factors (indicated by F ratios) were used as the coefficients for the final discriminant equation. Subsequent tests indicate that the items in the final instrument and the discriminatory formula separated the Ss into their appropriate occupational groups on the expressed motivational level. (19 ref.)—*Journal abstract.*

5547. Csirszka, Janos. *Uloha vlastnosti osobnosti při realizaci profesionálních přání.* [Role of personality features in the realization of vocational intentions.] *Výchovný Poradce*, 1969, Vol. 6(4), 35-37.—Presents methods used in determining such features based on the following considerations: (a) choice of vocation must be in the best interests of the individual and society; (b) personality development and best working results must be assured; and (c) personality features must give proper direction to natural abilities. Personal features helpful in realizing vocational ambitions were found to be (a) interest in work, (b) emotional approach to the vocation problem, (c) the development of proper approach to work, (d) high quality motivation and conscientiousness, (e) behavior control, and (f) ability to meet possible moral conflicts. It is concluded that the youth must be guided by his parents and pedagogs in such a way as to learn to enjoy work, and that a habit to work must be inculcated.—*I. Halev.*

5548. Csirszka, János. **Vizsgálati módszer a munka-és pályaeérdeklődés megismerésére.** [Interest taken in work and occupation.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 285-299.—The usual methods for the investigation of interest make the Ss choose preferred areas of interest. Saturation in trends of interest, i.e., a great variety of themes which interest an individual, must be distinguished from intensity of interest. This distinction is of practical importance when differentiating between trends, and not single themes of interest. For the latter purpose the M. Irle Berufs-Interessen-Test has been modified: (a) for items concerning specific occupations, items expressing general trends of interest were substituted; (b) trends of interest were selected by taking into account economic conditions in Hungary; and (c) 2 complementary tests were added to examine leadership and minimalist "sets." The data of level values of a preliminary investigation involving 500 14-15 yr. old elementary school boys and 500 17-18 yr. old secondary school girls are reported. (Russian summary) (19 ref.)—*English summary.*

5549. Dahlem, Glenn G. (Pattonville Public Schools, Mo.) **Actual, ideal, and expected role concepts of secondary counselors.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 205-208.—Investigated actual, ideal, and expected role concept perceptions of 74 secondary school counselors. A 50-item checklist by L. D. Schmidt was used as the research instrument. Expected role, i.e., what counselors believed public expectations of their activities to be, did not differentiate itself from ideal role. Significant ($p < .001$) differences were found on 10 of the 50 work activities contained in the checklist. Counselors indicated a desire to participate in more professional duties than they were then doing. Addition of more research activities was the paramount role alteration desired.—*Journal abstract.*

5552. Fletcher, Raymond. (Texas A & M U.) **Differences in selected psychological characteristics of participants and nonparticipants in activity.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 301-302.—Comparisons of EPPS responses by 672 activity participants and 278 nonparticipants yielded 1 difference (endurance) significant at $p_{.01}$ and 4 differences at $p_{.05}$. The magnitudes of these differences were so small as to be inconsequential for prediction.—*Journal abstract.*

5553. Garfield, S. Jeffrey; Cohen, Helen A., Roth, Robert M., & Berenbaum, Harris L. (Educational Resources, Inc., Chicago, Ill.) **Effects of group counseling on creativity.** *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 235-237.—Investigated the possible relationships between improvement in group counseling and changes in assessed creativity. It was hypothesized that creativity is positively related to mental health and that Ss who were judged improved, after 30 hr. of group counseling, would also show improvement on variables typically associated with creativity. 38 male undergraduates who participated in a group counseling experience over a 15-wk time span

were pre- and posttested on various measures of creativity, and pre- and posttested on Rogers' elements of creativity, i.e., (a) openness to experience; (b) locus of evaluation; and (c) ability to toy with ideas. At the end of the experimental time Ss were assigned to either an improved or unimproved category on the basis of therapists' ratings, outside judgments, and Q adjustment scores. Results indicate that improvement in group psychotherapy correlates significantly with gains in ratings on the more dynamic aspects (creative life style) of creativity. The correlations with the more cognitive measures of creativity were in the predicted direction but not significant.—*Journal abstract.*

5554. Gust, Tim. (U. Hawaii, Honolulu) **Extending counselor supervision.** *Counselor Education & Supervision*, 1970(Spring), Vol. 9(3), 157-161.—Proposes that supervision of the counselor trainee be extended into the trainee's 1st employment setting following completion of his master's degree program. This extension would be of benefit to the producer (counselor training program), the product (counselor trainee), and the consumer (local school or agency). The proposed model is suggested as also being relevant to the training of counselor supervisors.—*Journal abstract.*

5555. Harrington, Thomas F., Lynch, Mervin D., & O'Shea, Arthur J. (Northeastern U.) **Factor analysis of twenty-seven similarly named scales of the Strong Vocational Interest Blank and the Kuder Occupational Interest Survey, Form DD.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 229-233.—Compares the factor structures of the similarly named scales of the SVIB and Kuder Occupational Interest Survey (OIS), Form DD. 4 factors emerged from the analysis on the OIS and 5 factors were isolated on the SVIB. The OIS factors contain meaningful groupings of scales. This result and the high intercorrelations among the scales within the factors indicate that grouping occupational scales on the OIS is as appropriate as on the SVIB. Interpretations that attempt differentiation of a person's interests on the basis of individual scale scores within a factor are not advised. In a merged factor analysis of the 2 inventories, joint factors did not emerge.—*Journal abstract.*

5556. Hinze, William H. (Indiana U.) **The effects of group play activity upon the reading ability and anxiety of seven and eight year old boys with low reading achievement.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3269.

5557. Hollender, John W. (Emory U.) **Development of vocational decisions during adolescence.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 244-248.—Asked 5200 5th-12th grade students to state a vocational choice or indicate indecision in a cross-sectional study. Overall, significantly more female (69%) than male (59%) Ss reported a definite vocational choice. The percentage of male Ss who reported a definite vocational choice was greater in the elementary school (6th grade) and in the senior high school (10th-12th grades), than in the junior high school (7th-9th grades) for the Ss in the 2 lowest aptitude quartiles. Increasing intellectual ability, assessed by scholastic aptitude measures, was associated with increasing vocational decisiveness for both males and females. Results are discussed in the framework of a descriptive approach to vocational development theory. (16 ref.)—*Journal abstract.*

5558. Jackson, Mozelle & Thompson, Charles L.

(Northern Illinois U.) **Effective counselor: Characteristics and attitudes.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 249-254.—Studied 45 male and 28 female National Defense Education Act trained school counselors, differentiated according to sex and counselor effectiveness, for differences on (a) cognitive flexibility; (b) tolerance of ambiguity; and (c) attitudes toward self, most people, most clients, and counseling. All Ss were similar in cognitive flexibility and tolerance of ambiguity, but the most effective Ss were more positive in their counseling-related attitudes than the least effective Ss. Both effective and least effective female Ss were more positive than male Ss toward counseling-related attitudes. Attitudes toward most people, most clients, and counseling differentiated the 2 counselor effectiveness groups and male and female Ss. (25 ref.)—*Journal abstract*.

5559. Jansen, David G., Robb, George P., & Bonk, Edward C. (North Texas State U., Counseling Center) **Characteristics of high-rated and low-rated master's degree candidates in counseling and guidance.** *Counselor Education & Supervision*, 1970(Spring), Vol. 9(3), 162-170.—Investigates the relationship between intellectual and nonintellectual variables and counseling competence by comparing 17 female student counselors rated as falling within the top 25% in overall competence at the end of an evaluation seminar with their 17 female counterparts rated in the bottom 25%. Competence was operationally defined as a composite of knowledge of counseling theories and techniques, knowledge of and ability to use test data in counseling, and counseling skill. Significant differences between the high- and low-rated student counselors were observed on the dimension of CA, 5 of 6 intellectual variables, and 5 of 11 non-intellectual variables. Ss were tested on the Ohio State University Psychological Test, Cooperative English Tests, Guilford-Zimmerman Temperament Survey, and the Minnesota Teacher Attitude Inventory.—*Journal abstract*.

5560. Jotikasthira, Ampar & Sander, D. (U. Colorado) **Development of student personnel services in Thai education.** *Journal of the Student Personnel Association for Teacher Education*, 1970, Vol. 9(1), 17-22.—Currently noticeable shifts taking place in adolescent boy-girl relationships are producing conflict with long-standing social norms in Thailand. Rapidly developing economy, increased educational opportunities, and intensified vocational education programs produce enormous pressures on Thai youth. These have created an unprecedented need for rapid expansion of student personnel services. The problems are viewed as challenges; change represents opportunity; and counselors are in need of finding new ways to provide for individual differences among students and other youths.—S. M. Amatora.

5561. Kassera, Wayne J. & Sease, William A. (Wisconsin State U., School of Education, River Falls) **Personal change as a concomitant of counselor education.** *Counselor Education & Supervision*, 1970(Spring), Vol. 9(3), 208-211.—Selected 3 groups of students at various levels of counselor preparation to determine if significant changes in personal characteristics took place as a result of a semester of counselor education. The CPI, Rokeach's Dogmatism Scale (Form D), Berger's Acceptance of Self and Others Scale, and Porter's Test of Counselor Attitudes were employed as instruments to ascertain change. Results indicate a significant difference between advanced groups and

beginning groups and between pre- and posttest measures in a direction perceived as desirable by authorities in the field.—*Journal abstract*.

5562. Kinnick, Bernard C. & Nelson, Theodore M. (Colorado State Coll.) **The EPPS norms: Reevaluation a necessity.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 37-39.—Compared over a 6-yr period EPPS results from a 10% sample (743 males and 1077 females) of the total undergraduate population at a state college with the original Edwards norms. Males differed significantly from the published Edwards norms on 8 of 15 variables; the female sample differed significantly on 6 of 15 variables; and the total sample revealed significant differences on 9 of 15 psychological need variables. The study demonstrates that, even though the original EPPS had an excellent research base, a major revision of the Edwards norms is now warranted so that the EPPS may continue to be a successful counseling and assessment tool.—*Journal abstract*.

5563. Lewis, Marion Q. & Baker, Ronald D. (Iowa State U.) **Model reinforcement of verbalizations versus actions.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 283-284. Investigated model reinforcement counseling in a field experiment with 206 male undergraduates who had indicated that they would like to know more about other majors. 52 Ss viewed a videotape model in which a student described educational information-seeking activities to a friend who provided verbal reinforcements for his activities. 54 Ss viewed a second model in which the student's descriptions of his activities were augmented by scenes illustrating the activities described. The same sound track was used for both models. Ss were surveyed 1 mo. later as to their knowledge and use of campus educational information sources. No significant differences in total number of resources named or used were found between treatment, or treatment and control groups. *Journal abstract*.

5564. Lister, James L. & Northrop, J. L. (U. Florida) **Teaching experience for counselors: Review of evidence.** *Journal of the Student Personnel Association for Teacher Education*, 1970, Vol. 9(1), 8-16. Presents relevant research on the effects of teaching experience on counselor functioning under 2 major headings: interview behavior and guidance practice. The 1st is divided into studies of graduate students enrolled in counselor education programs and those using Ss who were practicing counselors. It is concluded that because of the great need for excellence in counseling, no potential source of qualified counselors should be ignored. The evidence indicates that the teaching ranks are not the exclusive source of effective counselors, although additional research is necessary to clarify the precise contribution of experimental background to counseling performance. Limitations of the studies are pointed out and indicate tentative acceptance until definitive research is conducted.—S. M. Amatora.

5565. Looft, William R. (U. Wisconsin) **Vocational aspirations of second-grade girls.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 241-242.—Asked 41 2nd grade girls in a Catholic school about their vocational interests or aspirations from 2 different perspectives: (a) their desired occupational goals, and (b) their realistic expectations regarding their occupational goals. To the 1st question most Ss nominated vocations which were very sex-role stereotyped and altruistic (nurse and teacher were most common); to the 2nd question Ss

tended to (a) repeat their original response, (b) change their expectation to becoming mothers and housewives, or (c) express that they did not know what they would be. Findings suggest that sex-role expectations pertaining to vocational aspirations are acquired and solidified far sooner than the time when the individual actually has to begin to make decisions regarding his adult life.—*Journal abstract*.

5566. Mann, Philip A. (U. Texas) **Referral source and test-seeking as factors in establishing a counseling relationship.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 221-224.—Examined 2 hypotheses: (a) faculty-referred cases are less likely to reach agreement than cases referred by friends or self-referrals, and (b) cases in which a specific request for testing is made are less likely to reach agreement than cases in which the client does not request testing. Referral source and test seeking were found to interact in effecting a successful counselor-client contract in studies of 279 undergraduates. Faculty-referred test seekers were least successful and self-referred test seekers were most successful in reaching agreement with a counselor. Implications for counseling practice are discussed.—*Journal abstract*.

5567. Markey, Martin J., Fredrickson, Ronald H., Johnson, Richard W., & Julius, Mary A. (U. Massachusetts) **Influence of playback techniques on counselor performance.** *Counselor Education & Supervision*, 1970(Spring), Vol. 9(3), 178-182.—Studied the training impact of different electronic playback techniques on ratings of student counselor performance. 32 upperclass female undergraduates were randomly divided into 4 playback treatment groups: (a) audio-video, (b) audio, (c) video, and (d) no playback received. 4 female undergraduates served as trained clients. All student counselors interviewed 2 different trained clients in 2 20-min sessions separated by a playback treatment period. All sessions were recorded by television cameras. Trained judges rated the 2nd interview using the Counselor Evaluation Inventory, Nonverbal Behavior Scale, and Audio-Visual Counseling Scale. 2-way analysis of variance was used to compare scores on criterion instruments. Results indicate no judged differences among the playback treatment groups, nor could discriminant rankings be made among the various playback methods. Several explanations are discussed as to limited influence of playback media on early interview performance. (19 ref.)—*Journal abstract*.

5568. McCabe, Fred J. (U. Idaho) **A comparison of selected psychological, sociological, and educational characteristics of occupational, academic, and vocational groups.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3273.

5569. McCarthy, Barry W. (American U.) **Comparison of effectiveness of group-counseling procedures.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 283-286.—Compared, using delayed multiple-criteria measures, the effectiveness of 2 different group-counseling techniques with 88 undergraduates who expressed a desire to improve their academic performance. The procedures were (a) the traditional approach focusing on personal-emotional problems, and (b) the development of behaviors appropriate for college achievement. Groups were compared with 2 control groups on 3 criteria, change in GPA, adjustment scores, and study habits and attitudes scores. No significant differences were found.—*Journal abstract*.

5570. Mechling, Donald J. (U. California, Berkeley) **Some behavioral and attitudinal correlates of the locus of control and the locus of evaluation in high school students.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3273.

5571. Miller, C. Dean; Morrill, Weston H., & Uhlemann, Max R. (Colorado State U., Counseling Center) **Micro-counseling: An experimental study of pre-practicum training in communicating test results.** *Counselor Education & Supervision*, 1970(Spring), Vol. 9(3), 171-177.—Employed microcounseling techniques to train 10 graduate students in communicating test results. Training emphasized listening and responding to cues given by the client, brief and concise statements about test-related information, and relating the information to the client's experiences and needs. Training aids included programed materials, brief videotapes of positive and negative models, role-playing, and videotape feedback of the role-playing and test interpretation sessions. Judges' ratings of trainees in the experimental group were significantly higher than their ratings for the 10 trainees in the control group. Client ratings of counselor effectiveness did not differ significantly for the 2 groups. Changes in clients' pre- and posttest attitude and knowledge scores were statistically significant. An enthusiastic response to the microcounseling approach was evident from both inexperienced and experienced Ss.—*Journal abstract*.

5572. Mishne, Judith. (U. Chicago, School of Social Service Administration) **Group therapy in an elementary school.** *Social Casework*, 1971(Jan), Vol. 52(1), 18-25.—Although it represents a small, wealthy district with funds, personnel, and leisure to develop programs, the experiences of the Orange School System in a pilot study are relevant to the widespread crisis in schools today. Because of the study, the school district altered its approach to the unreachable, nonreferable child. It has designated funds for personnel who could be with students, talk to them, and most important, listen to them. Results showed all the children concluded the year reading on their proper 3rd grade level, higher than the national 3rd grade norm. The teacher's comments were positive concerning improved social adjustment, increased interest, effort put forth by a child, better conforming to classroom routine, better group acceptance, and lessened tension.—*M. W. Linn*.

5573. Mitchell, Sandra K., Lunneborg, Patricia W., & Lunneborg, Clifford E. (U. Washington) **A Vocational Interest Inventory based on Roe's interest areas.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 569-570.—The construction and early validation of an ipsative, forced-choice Vocational Interest Inventory (VII) to measure A. Roe's 8 foci of occupational activity is detailed. Designed for counseling use with the broad range of high school students, the VII produced consistently interpretable mean profiles for groups of high school juniors having only tentative vocational orientations: health sciences, engineering, business, etc. Factor analytic studies revealed 3 dimensions. Service vs. technology and science vs. business provided confirmation for the Roe-Holland hypothesis of a circular continuity of vocational interests. The 3rd factor defined an organizational (indoor) vs. outdoor dimension.—*Author abstract*.

5574. Morgan, Elizabeth R. (Columbia U.) **Behavior theory counseling with culturally disadvantaged.**

underachieving youth. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3274-3275.

5575. Morgan, James M. (Indiana U.) **The effect of model exposure and behavior rehearsal on the initiation of dating experiences by seldom dating college men.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3275.

5576. Payne, Paul A. & Mills, Robert B. (U. Cincinnati, Counseling Service) **Practicum placement in a counseling-employment agency for disadvantaged youth.** *Counselor Education & Supervision*, 1970(Spr), Vol. 9(3), 189-193.—To emphasize the development of skills in helping the culturally disadvantaged, 8 graduate students were given practicum placement in an agency which gave counseling and employment training to disadvantaged youth. Ss attended staff meetings, interviewed staff members concerning the work they performed, and discussed client contacts with caseworkers, in addition interviewing agency clients. Increased awareness of problems, broadened conceptualizations, and expansion of interpersonal skills were seen as advantages of the practicum. Limitations included some lack of goal clarity and inefficiency of time use in dealing with the clientele.—*Journal abstract*.

5577. Perkins, John A. & Wicas, Edward A. (15 Brae St., Providence, R.I.) **Group counseling bright underachievers and their mothers.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 273-278.—Investigated the use of counseling with small groups of bright, underachieving, 9th grade boys and/or their mothers. 120 boys and 60 mothers comprised the total sample. 5 male public school counselors were trained to offer minimal levels of accurate empathy, regard, and genuineness within a group counseling context. Post-treatment results reveal significant increases in GPAs and self-acceptance. It was found that when counselors worked with mothers with or without students, the effect on underachievers was equal to or greater than when counselors worked only with underachievers. (19 ref.) *Journal abstract*.

5578. Riley, Richard. (U. Rochester) **An investigation of the influence of group compatibility of group cohesiveness and change in self-concept in a T-group setting.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3277.

5579. Rochester, Dean E. (Southern Illinois U., Edwardsville) **Persistence of attitudes and values of NDEA students: Two years post institute.** *Counselor Education & Supervision*, 1970(Spr), Vol. 9(3), 205-207.—82 students who had been enrolled in a yr-long counseling and guidance program were followed up for a 2-yr period concerning attitudes and values. Data was obtained from a final N of 78 Ss. Ss were administered the Porter Test of Counselor Attitudes and the Study of Values. Ss' attitudes and values were similar to those present at the onset of their program and similar to those present after they had been away from their program 1 yr. Some differences were noted concerning end-yr. of-program responses. Changes occurring during the programs appear minimal. Since there were no differences indicated between the 1- and 2-yr follow-up, 1 yr. might be a sufficient period for this type of investigation.—*Journal abstract*.

5580. Schvaneveldt, Jay D. (Utah State U.) **Role problems of the college family life educator and researcher.** *Family Coordinator*, 1971(Jan), Vol. 20(1), 3-10.—Points out the difficulty of depicting the family

life educator or researcher due to the diverse roles inherent in the occupation. Performing a teaching, research, and counseling function, the family life educator's image is often confused or ambiguous. Specific problems in the roles of sex, professionalism, multiple functions, and interdisciplinary conflicts are illustrated.—M. W. Linn.

5581. Sieveking, Nicholas A., Harrison, Patsy J., Ackerman, Barbara R., & Gorsuch, Richard L. (Vanderbilt U.) **Moral judgments of students, parents, and psychological clients.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 579-580.—Parents were more severe than their offspring, college students, in judging the wrongness of specific behaviors on scales such as Misrepresentation, Anti-Social Selfishness, and New Morality. Parents also reported more frequent church attendance and greater personal importance of religion. Students who had been clients for psychological services, as compared with nonclient students, chose "none" for religious preference more frequently and rated religion as less important to themselves, although there were no differences between student-clients and student-non-clients in severity of moral judgments. On several scales parents of nonclients were more severe in judging wrongness than were parents of clients.—*Author abstract*.

5582. Smith, Osler P. (East Texas State U.) **Changes in self-actualization and self-concept as a result of the use of visual feedback in marathon sensitivity training.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3280.

5583. Spiritas, Alexis A. & Holmes, David S. (U. Texas) **Effects of models on interview responses.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 217-220.—Predicted that the degree to which a model gave personally revealing responses in an interview would influence the degree to which Ss gave revealing responses in a subsequent interview. The prediction stemmed from previously reported data on the disinhibiting effects of models and behavioral contagion. 120 female undergraduates were exposed to a revealing model, a nonrevealing model, or no model before being interviewed by either a male or female. Results indicate that the models significantly affected the duration and the degree of revealingness of interview responses. Across modeling conditions Ss talked longer to the female interviewer but were not more revealing than they were with the male interviewer. (16 ref.)—*Journal abstract*.

5584. Squatriglia, Robert W. (U. South Carolina) **The impact of short-term group counseling on student values.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3280-3281.

5585. Stillman, Stephen & Resnick, Harvey. (Ohio State U.) **Does counselor attire matter?** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 285-286. Investigated the relationship between counselor attire and (a) client disclosure, and (b) client perception of counselor attractiveness in an initial interview analogue. 50 male undergraduates took part in a 20-min interview with either a professionally or casually attired counselor and then responded to the Disclosure Scale and the Counselor Attractiveness Rating Scale. Analyses of variance revealed no significant differences ($p < .05$) between mean scores on these instruments. It is concluded that counselor attire has little effect on client disclosure and client perception of counselor attractiveness.

tiveness in an initial interview.—*Journal abstract.*

5586. Stoffer, Dean L. (Edinboro State Coll.) **Investigation of positive behavioral change as a function of genuineness, nonpossessive warmth, and empathic understanding.** *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 225-228.—Research has shown that genuineness, nonpossessive warmth, and accurate empathy are positively related to therapeutic outcome for neurotic and schizophrenic adults. An attempt was made to extend and clarify these findings with elementary school children. 35 adult females volunteered to work individually with 35 children who were experiencing behavioral and academic difficulties. Early and late interviews were tape recorded and rated on each of 3 variables. Each helper and each child completed a relationship inventory. Late-rated non-possessive warmth, late-rated accurate empathy, and the total scores on the children's relationship inventories were significantly related to positive behavioral change. Similar programs will need to find methods of raising the overall level of therapeutic conditions offered by the helpers.—*Journal abstract.*

5587. Strong, Stanley R., Hendel, Darwin D., & Bratton, Joseph C. (U. Minnesota) **College students' views of campus help-givers: Counselors, advisers, and psychiatrists.** *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 234-238.—67 female undergraduates described either counselor, adviser, or psychiatrist on 100 adjectives and indicated how likely they were to discuss 9 topics with the assigned person. Ss (a) described counselors and advisers similarly as more warm and friendly than psychiatrists who were considered more intellectual, analytic, decisive, cold, and critical; (b) viewed counselors and advisers as more appropriate sources of help with vocational and educational problems and considered psychiatrists more appropriate for specific personal problems; and (c) viewed counselors as likely sources of help for achieving personal development and gaining knowledge of strengths and weaknesses.—*Journal abstract.*

5588. Stugart, David B. (Michigan State U.) **An experimental study investigating the effects of model race and model age-referent group upon the vocational information-seeking behaviors of male black eleventh-graders.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3281.

5589. Verett, Gary D. (North Texas State U.) **The effect of a summer group counseling institute on selected attitudes and personality characteristics of junior college counselors.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3283.

5590. Wisser, Robert E. (Lehigh U.) **A comparison of the effects of three types of counseling upon the adjustment of fifth grade boys.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3284.

5591. Yochim, David A. & Dworkin, Nancy. (Children's Hosp., Washington, D.C.) **A comprehensive interdisciplinary pupil appraisal system utilizing the school psychologist as psychoeducational diagnostician and consultant.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 565-566.—Describes a comprehensive interdisciplinary pupil appraisal system, based on the fundamental concepts of early intervention and multiple, need-matched diagnostic levels. School psychologists are utilized in the key role of psychoeducational specialist, with functional tasks also spelled out

for social workers and physicians. The activities of each team member at each of the diagnostic levels are presented, with particular attention given to the psychologist's performance of a brief, academic task-oriented psychoeducational assessment, a major component of the 2nd level. Mention is made of a preliminary evaluation study attempting to determine, using multiple criteria, the utility of the system.—*Author abstract.*

5592. Ames, Robert G. (U. Idaho) **Personal variables of satisfied superintendents.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3191.

5593. Burrello, Leonard C. & Sage, Daniel D. (U. Michigan, Inst. for Study of Mental Retardation) **A Behavior Preference Inventory for special education administrators.** *Exceptional Children*, 1971(Jan), Vol. 37(5), 365-370.—Discusses the development and validation of the Behavior Preference Inventory (BPI), to measure the need values of special education administrators, utilizing J. B. Rotter's social learning theory. The 5 need categories of recognition-status, protection dependency, dominance, independence, and love and affection, were examined in an experimental test sample with which a validating instrument was used involving the administrator's subordinates. A normative sample involving 341 members of the Council of Administrators of Special Education contributed additional descriptive data. It is advocated that the BPI is useful as a screening device in related research on the relationship of need value to expectancy and situational determinants in decision making. It is also proposed that the instrument serve as a vehicle for the sensitization of administrators to their personality investment in decision making.—*Journal abstract.*

5594. Cross, W. Ray. (U. Minnesota) **Relationships between elementary school principals' in-basket performance and their on-the-job behavior.** *Journal of Educational Research*, 1969(Sep), Vol. 63(1), 26-30.—Investigated the empirical validity of the Whitman School In-basket Test for elementary principals. Correlations were computed among scores from a predictive test, a concurrent test, and corresponding measures of observed on-the-job behavior. Results indicate that (a) there was evidence of stability of in-basket performance, (b) stylistic measures of principals' in-basket performance were not substantially related to their on-the-job behavior; and (c) there was evidence that impressionistic measures of in-basket performance bore some relationship to impressions of on-the-job behavior.—*Journal abstract.*

Teachers & Teacher Training

5602. Anderson, Donald D. (Armstrong State Coll.) Personality attributes of teachers in organizational climates. *Journal of Educational Research*, 1969(Jul), Vol. 62(10), 441-443.—Attempted to ascertain by means of responses to the EPPS, if personality patterns of elementary school teachers in schools possessing open organizational climates differed significantly from those of elementary school teachers in schools having closed organizational climates. Through the use of the Organizational Climate Descriptive Questionnaire, 71 teachers from schools having open organizational climates and 99 teachers from schools having closed organizational climates were identified. Raw score profiles collected by administering the EPPS were tabulated for each of the Ss in the 2 groups and analyzed statistically through the use of generalized F test and the t test. The F ratio was not significant at the acceptable .05 level of confidence. Teachers from schools having open climates did score significantly ($p < .05$) higher on the personality variables of intraception and abasement.—*Journal abstract*.

5604. Asbury, F. R., Ball, R. L., & Constantino, N. V. (U. Georgia) Effects of foundations course on personality variables. *Journal of the Student Personnel Association for Teacher Education*, 1970, Vol. 9(1), 23-32.—The study, based on a sample of 365 teacher candidates, studied the effects of systematic treatment, discussion, and concrete exemplification in classroom practice of selected concepts of human behavior on some personality variables of teacher candidates in a foundation of education course. Data were derived from pre- and postcourse tests using the Minnesota Teacher

Attitude Inventory (MTAI) and the Myers-Briggs Type Indicator (MBTI). Statistical analysis revealed that candidates (a) achieved significantly higher scores on postcourse MTAI measures, (b) made a significant mean movement from "thinking" toward "feeling" preferences on the MBTI, (c) made a significant mean movement from judgmental toward perceptive preferences on the MBTI, (d) failed to change significantly on the Sensing-Intuiting scale of the MBTI, and (e) failed to change significantly on the Introversion-Extroversion scale of the MBTI.—S. M. Amatora.

5605. Baker, Eva L. (U. California, Los Angeles) Relationship between learner achievement and instructional principles stressed during teacher preparation. *Journal of Educational Research*, 1969(Nov), Vol. 63(3), 99-102.—Little research has been done which investigates the relationship between teachers' behavior and their ability to bring about behavioral changes in their students. 38 Peace Corps trainees were given instruction in the use of theoretically-based learning principles. Os were concurrently trained to record teachers' use of these principles. The trainees were then required to teach high school students in a videotaped lesson. Trainees were each assigned a behavioral objective to achieve and high school students were pre- and posttested on items measuring the objectives. Positive relationships were found between student achievement and trainees' observed use of certain learning principles.—*Journal abstract*.

5612. Emans, Robert. (Ohio State U.) Teacher attitudes as a function of values. *Journal of Educational Research*, 1969(Jul), Vol. 62(10), 459-463. Hypothesized that conflicting values are related to a lack of acceptance of a school's curriculum by the faculty. Data were collected through the employment of 3 instruments (Differential Values Inventory by R. Prince, an adaptation of the Kretlow Scale by B. Kretlow and W. Dreier, and the Teacher Attitude Scale). School faculties which expressed the greater differences in educational values also expressed the greatest amount of disapproval

of the school's curriculum. However, individual teachers with extreme values indicated more favorable attitudes toward the curriculum than teachers with more neutral values. Values held by principals were related to teachers approval of the curriculum. (16 ref.)—*Journal abstract.*

5613. Feather, N. T. (Flinders U., South Australia, Bedford Park) Teaching effectiveness and examination performance in introductory psychology. *Australian Psychologist*, 1970(Mar), Vol. 5(1), 36-48.—A questionnaire, to provide information about teaching effectiveness and about the course, was administered to 162 students in introductory psychology before the final examination. The results were interpreted to show a trend toward Ss' regarding an instructor more highly as he emphasized general concepts and principles. The questionnaire was evaluated as useful in predicting instructors' effectiveness. Also, there was some support for the hypothesis that positive evaluations of teaching effectiveness of an instructor was associated with better performance on his examination questions. The general problem of using student responses to evaluate teaching effectiveness and course content is discussed.—*H. Roemmich.*

5621. Hobson, Edward N. Empirical development of a computer managed instruction system for the Florida State University model for the preparation of elementary school teachers. *CAI Center Technical Report, Florida State U.*, 1970(Apr), No. 8, 124 p.—Describes the design, development, and prototype implementation of a computerized management system for training elementary teachers. The problems examined consisted of the development of a data acquisition and instructional system (a) to collect reliable data to assess the management system's actual performance and its acceptability by the trainees, (b) to manage a variety of available resources, (c) to schedule trainees' activities, and (d) to monitor each trainee's progress. 19 elementary education students participated in a 3-wk field trial of an individualized instructional curriculum. The activities included the selection of tasks and resource options, the teaching of concepts to local school children, the taking of quizzes both manually and via a teletype terminal, and the entering of data associated with these activities at an on-line teletype terminal. Hardware, software, and personnel requirements of the present operational model are made with their respective costs. The management system's interface with the university information system is discussed.—*Journal abstract.*

An application of simulator techniques to an innovative teacher training program. *CAI Center Technical Report, Florida State U.*, 1970(Nov), No. 16, 127 p.—Analyzed an innovative teacher training program with 2 simulation techniques. The training system allowed for self-pacing and freedom of choice concerning the number and type of learning subtasks (enablers) the trainee would undertake. Within the behavioral simulation, 19 elementary education

evaluation of research findings in educational psychology. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3350-3351.

5637. Sands, Billie L. (Michigan State U.) An exploratory study of self-actualization and self-perception of competency among Michigan family life teachers. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3425-3426.

5638. Silcock, Anne. (U. Queensland, Brisbane, Australia) Aspects of the role performance of kindergarten teachers. *Australian Psychologist*, 1970(Mar), Vol. 5(1), 25-35.—Examined the role performance of kindergarten teachers with the purpose of reporting behaviors characterizing their interactions with young children. The interactions of 9 teachers and 15 student teachers with 24 3.1-5.4 yr. old children were observed for 3 consecutive hr. on each of 2 successive mornings and recorded. 3 goals were found to predominate, at least quantitatively. Children were (a) persuaded to join in certain aspects of the program, (b) encouraged to take part in "ritual-related" behavior, and (c) induced to join such common activities as tidying up the room. Teachers used mild methods in 51% of the transactions, temperate in 46%, and strong methods in less than 3%. Significant differences existed between the methods employed for different ages. Some differences in compliance with different ages were found, and at each age a discrepancy of more than 20% occurred between responses made by children to meet teachers' goals and responses they would have preferred. More than 1/3 of all contacts initiated by teachers resulted in conflict. It is stated that the role of the kindergarten teacher is that of a teacher, carrying with it the authority and responsibilities concomitant with that role.—H. Roemmich.

5640. Staines, J. W. (U. Newcastle, New South Wales, Australia) The teacher's therapeutic role in ordinary classroom situations. *Australian Psychologist*, 1970(Mar), Vol. 5(1), 9-24. Presents an argument for a dual role of the typical elementary and secondary teacher: that of teaching for academic outcomes and that of therapist. 4 viewpoints are discussed which deal with the therapeutic role of the teacher: (a) the psychoanalytic view in which the teacher's therapeutic role is rigidly excluded, (b) the view that the teacher often contributes to psychic disorders and is needed in an ancillary role in treatment under the supervision of a clinician, (c) a view which recognizes the teacher's therapeutic role and the importance of mental health in the classroom, and (d) the view supported by the main thrust of the article, which describes the teacher as also a therapist. It rests upon the notion that typical psychotherapy, counseling and guidance, are common learning processes and both the therapeutic process and the learning process are evaluated in terms of behavioral outcomes. This thesis is extended and documented. (36 ref.)—H. Roemmich.

5641. Tuckman, Bruce W., Forman, Norman, & Hoy, Wayne K. (Rutgers State U.) Teacher innovativeness: A function of teacher personality and school environment. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 527-528.—Teachers who submitted proposals to the New Jersey State Department of Education to obtain a migrant for an innovative classroom project and were

funded were classified as innovative; those not funded were classified as noninnovative. These 2 groups completed the Organizational Climate Descriptive Questionnaire describing the environment or climate of their school as open or closed, and the Interpersonal Topical Inventory, a measure of the abstractness of their personality structure. As hypothesized, innovative teachers in open climates were more abstract than innovative teachers in closed climates while the reverse held true for noninnovative teachers. This supports Lewin's interactive model of behavior prediction.—Author abstract.

5643. Westbrook, Arlen. (Northeastern New York Speech Center, Inc., Albany) Teachers' recognition of problem behavior and referrals of children to pupil personnel services. *Journal of Educational Research*, 1970(May), Vol. 63(9), 341-344. Analyzed the questionnaire responses of 104 teachers in an upstate New York suburb. Ss rated the seriousness of 43 behavior items on a 4-point rating scale. The items indicated 4 types of behavior problems: (a) withdrawn and recessive personality, (b) aggressive and acting-out behaviors, (c) learning problems, and (d) other. Mean score for the entire inventory was 2.54, for withdrawn items 2.31, for aggressive items 2.50, and for learning items 2.95. Referrals for these groups to other agencies were 41, 63, and 232, respectively. Results are considered as paralleling an earlier study by E. K. Wickman in 1928 and indicate the growing recognition of learning problems. Implications for teacher training in mental hygiene and the need for expanded services are discussed.—Journal abstract.

5650. Burke, Ronald J. (U. Minnesota) Some preliminary data on the use of self-evaluations and peer ratings in assigning university course grades. *Journal of Educational Research*, 1969(Jul), Vol. 62(10), 444-448.—Presents results of 3 investigations with 113 undergraduates of attempts to increase university student participation in the determination of their final course grades. Increased participation took the form of (a) self-evaluations, and (b) peer ratings. Data from 2 experiments indicate that Ss were unable to assign their own grades realistically. This was shown by low agreement between self-evaluations and peer ratings, and self-evaluations and instructor ratings. Self-ratings were always more favorable than peer and instructor ratings when disagreements occurred. Although many Ss felt that peers were performing at C and D levels, no S believed that he deserved less than a B grade. The 3rd experiment showed that peer ratings yielded (a) a more typical grade distribution, (b) a high degree of internal consistency, and (c) good agreement with instructor ratings.—*Journal abstract*.

5652. Child, Dennis. (U. Bradford, School of Education, England) Some aspects of study habits in higher education. *Educational Sciences*, 1970(May), Vol. 4(1), 11-20.—Designed and administered an interview schedule relating to general study methods to 74 6th form, 55 college of education, and 52 technological university students. It was found that (a) Ss prefer to work in the weekday evenings, (b) an average study session lasts from 1-2 hr., (c) libraries are not popular places for study, (d) Ss claim to read beyond their set work, (e) university and college of education science Ss thought they devoted too much time to writing up practical notes, (f) Ss have developed their own study styles by trial and error without external guidance, (g) examination review begins about the 6th wk. before the 1st paper, (h) most Ss select a portion of the syllabus for detailed review, (i) science Ss tend to review the entire syllabus, (j) 70% find that personal problems interfere with normal study, (k) 75% claim that the relationship

between themselves and tutors has an important bearing on their study attitudes in a particular subject, (l) over 80% collaborate with fellow students in arriving at the group norm for work assignments, and (m) 60% admitted that the output of teachers could be influenced by a variety of direct and indirect strategies. (French & German summaries)—*Journal abstract*.

5653. Chopra, Sukhendra L. (Lucknow U., India) Cultural deprivation and academic achievement. *Journal of Educational Research*, 1969(Jul), Vol. 62(10), 435-438.—Reports that in a sample of 433 15-17 yr. old students randomly selected from 16 boys' secondary schools in Lucknow, India, the mean marks scored by Ss in the higher socioeconomic group were significantly higher than those of Ss from middle and lower socioeconomic groups. The differences between the middle and the lower socioeconomic groups, however, did not reach the level of significance. There was positive relationship between socioeconomic background and achievement in English, mathematics, and science, but achievement in Hindi, biology, and art was relatively free from the influence of background. The pattern of relationship between background and achievement was the same at all 3 intellectual ability levels. (19 ref.)—*Journal abstract*.

5654. De, Bimaleswar & Singh, Ramadhar. (Patna U., Inst. of Psychological Research & Service, India) Home adjustment as a determinant of academic motivation. *Indian Educational Review*, 1970(Jul), Vol. 5(2), 52-58.—Focuses on the relationship between academic motivation and certain aspects of home environment: home adjustment, size of family, number of siblings, and birth order. Ss were 222 8th-11th graders (age range, 12-17 yr.). The Hindi versions of the Aberdeen Academic Motivation Inventory and the items measuring home maladjustment in the student form of the Bell Adjustment Inventory were administered in a classroom situation. A significant negative correlation was found between home maladjustment and academic motivation. Family size, number of siblings, and birth order were found to have no significant relationship with academic motivation. The results suggest that home adjustment contributes to the development of strong academic motivation. (38 ref.)—K. C. Panda.

5655. Elovson, Allana C. (U. California, San Diego) The effect of penalty and information on error. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 549-550.—Errors committed by 100 2nd and 3rd graders while learning a 20-item, 4-choice verbal task were followed by penalty (P), information (I), or penalty plus information (PI). Correct responses received either reward or confirmation. 3 trials were given. Errors which were only penalized were repeated as often as initially correct responses which had been rewarded or confirmed, and significantly more often than errors followed by either I or PI. Significantly more correct responses followed errors receiving I or PI than followed initially correct responses which were rewarded or confirmed. Information alone produced more corrects than did PI.—*Author abstract*.

5656. Entwisle, Doris R. & Greenberger, Ellen. A survey of cognitive style in Maryland ninth-graders: III. Feelings of control over academic achievement. *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Aug), No. 78, 34 p. As part of a survey of cognitive style variables in Maryland

9th graders, sense of control in 312 boys and 352 girls was measured by the Crandall Intellectual Achievement Responsibility Questionnaire. Feelings of control over success were greater than those over failure for both sexes. Results disagree with previous work in 4 ways: (a) control beliefs did not predict school achievement, (b) middle-class girls expressed lower feelings of control than comparable boys, (c) positive association between IQ and control was manifest only for boys, and (d) relationships between social class and control beliefs were the opposite of those found previously with lower-class Ss expressing higher control beliefs. Explanations for the divergent results are proposed. (21 ref.)—*Journal abstract.*

5657. Entwistle, Doris R. & Webster, Murray A. **Raising children's expectations for their own performance.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U., 1970(Nov), No. 87, 26 p.*—Reports an experiment which shows that most children's expectations for their own performance, measured by their rate of volunteering, can be increased. 188 white middle-class 1st-4th grade suburban children participated in a story-telling task. A white adult acted to increase expectations of a single S (experimental group), while 3 other Ss (control group) received a comparable treatment except for the expectation-raising component. 1st grade Ss showed a positive, but nonsignificant increase. There was a significant increase for Grades 2-4. Results for 3rd and 4th graders are compared with results from an earlier experiment with black inner city and rural white children. (15 ref.)—*Journal abstract.*

5658. Evans, James D. (Geneva Coll.) **The relationships of three personality scales to grade point average and verbal ability in college freshmen.** *Journal of Educational Research, 1969(Nov), Vol. 63(3), 121-125.*—Studied the relationships between the Ac, Ai, and Ie scales of the CPI and 3 criteria—GPA, verbal ability, and quantitative ability—with 6 groups of 102 college freshmen. Each group differed from the others in 1 or both of the following characteristics: (a) sex, and (b) enrollment in a psychology-of-adjustment course. The obtained Ac-GPA and Ie-GPA correlations were nonsignificant for all groups used in the current investigation. Ai was significantly related to GPA of the total psychology-of-adjustment and the male psychology-of-adjustment groups. While all 3 scales were generally unrelated to quantitative ability, Ai and Ie were somewhat related to verbal ability, especially for male freshmen.—*Journal abstract.*

5659. Farley, Frank H. & Mealiea, Wallace L. (U. Wisconsin) **Individual differences in the Zeigarnik effect.** *Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6(Pt. 2), 543-544.*—On the basis of previous research and theoretical considerations, the recall of completed and incomplete items in an examination situation was studied as a function of individual differences in repression-sensitization tendencies and resultant achievement motivation (RAM; need-for-achievement minus fear-of-failure). Ss were 78 female undergraduates. The Zeigarnik effect, i.e., the greater recall of incomplete over completed tasks, was found to be significantly more frequent in high RAM Ss than low RAM Ss, but no difference was found between repressors and sensitizers in this effect. Results support Atkinson's theoretical analysis of achievement motivation and task recall but

do not support a repression analysis. No significant level-of-aspiration differences were obtained between high and low RAM Ss or repressors and sensitizers.—*Author abstract.*

5660. Feldhusen, John F., Thurston, John R., & Benning, James J. (Purdue U.) **Longitudinal analyses of classroom behavior and school achievement.** *Journal of Experimental Education, 1970(Summer), 38(4), 4-10.*—3rd-, 6th-, and 9th-grade teachers in Wisconsin county-nominated 982 children as consistently displaying socially approved behavior and consistently displaying aggressive-disruptive behavior in the classroom. 5 yr. after the original nomination, teacher grades in English, science, mathematics, social studies; rank in graduating class for original 3rd graders; and Sequential Tests of Educational Progress scores were obtained. Analyses of covariance were run with IQ as the covariate, and behavior, grade, sex, and home location as the independent variables. Results indicate clearly that the Ss whose behavior was consistently aggressive and disruptive in the classroom achieved significantly lower levels than their socially approved peers. (17 ref.)—*Journal abstract.*

5667. Khan, S. B. (Dept. of Measurement & Evaluation, Toronto, Ontario, Canada) Development of mental abilities: An investigation of the "differentiation hypothesis." *Canadian Journal of Psychology*, 1970(Jun), Vol. 24(3), 199-205.—Attempted to determine the extent to which verbal, numerical, spatial, and perceptual speed abilities will be differentiated as a function of differing amounts of classroom learning. The hypothesis was tested that verbal and numerical abilities will be differentiated earlier than perceptual speed and spatial abilities, because learning requires the former types of abilities. It is emphasized quite early in the school program, 3 groups (111 7th graders, 95 9th graders, and 75 11th graders) were given the tests measuring verbal, numerical, perceptual, and spatial-scanning abilities from the Kit of Reference Tests. The factor analyses of the correlation matrices yielded 4 factors for each sample associated with eigenvalues greater than 1. The verbal and numerical factors were identifiable at the Grade 7 level but none of the other 2 was easily interpretable. The spatial-scanning factor emerged at the Grade 9 level and a 4-factor pattern distinctly defined at the Grade 11 level. Results support the hypothesis that mental abilities become differentiated as a function of increased learning experiences. (French summary)—*Journal abstract*

5668. Kulkarni, S. S. & Saldu, C. A. (National Inst. of Bank Management, Bombay, India) Mathematics achievement related to students' socio-economic and attitude variables: A pilot study. *Journal of Educational Psychology*, 1970(Mar), Vol. 45(1), 53-66. Sixteen (68) students from 113 high schools. The tools used were several mathematics tests and a questionnaire to collect information mainly on: (a) socioeconomic status of the family, the parents' occupation and education, the extent of exposure about the facilities provided for education, and the students' attitude towards mathematics as a subject and its role in the modern civilization, and (b) the school environment, and school education in general and mathematics in particular. The socioeconomic index constructed from (a, b, and c) and other factors did not suggest any high correlation with mathematics achievement, whereas observations on the socioeconomic factors in the teaching-learning process to attain the stated objectives in the educational system.

5679. Prien, Erich P. & Woodley, Kathryn. (Memphis State U.) **Note on reliability of peer ratings of classroom performance.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 89-90.—Reports the duplication of a study by E. Prien and R. Lee (see PA, Vol. 39:8591) of the change of internal consistency and temporal reliability of peer ratings of classroom performance as related in increasing amounts of interpersonal exposure time. 29 undergraduates served in 5 groups as part of a 6-wk course in industrial psychology. Peer ratings were obtained on Days 3, 4, and 5 of the 1st wk., Days 2 and 4 of the 2nd wk. and on Day 5 of the 3rd-6th wk. Interjudge consistency increased appreciably as interpersonal exposure time increased but there was also considerable variability between rating sessions.—*Journal abstract*.

5680. Sabatino, David A. & Hayden, David L. (Pennsylvania State U.) **Psycho-educational study of selected behavioral variables with children failing the elementary grades: I.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 40-47.—Administered a psychoeducational test battery to 472 children failing in the elementary grades in a county school system. Information-processing behaviors associated with learning and related to the multiple causes of failure were studied. The major premise was that perceptual and cognitive behavioral disability is a more concise basis for the prevention and treatment of school failure than other frequently quoted theories, especially regarding the individual child. Data show that failing Ss had specific language and perceptual information-processing behavioral problems appearing as receptive, central, and expressive language, auditory perceptual, auditory and visual perceptual memory, and perceptual integrative difficulties. Ss did not seem to have perceptual copying, motor, laterality, or directionality difficulties. Teacher ratings and academic achievement did not provide a basis for understanding why failure occurs.—*Journal abstract*.

5681. Sabatino, David A. & Hayden, David L. (Pennsylvania State U.) **Psycho-educational study of selected behavioral variables with children failing**

the elementary grades: II. *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 48-57.—Administered a psychoeducational assessment of the information-processing behaviors related to learning to 472 children who were failing in the elementary grades in a county school system. The mean age was 9.6 yr. Ss were divided at the mean age into a -9.6 group and a +9.6 group. Data were treated for means, standard deviations, and *t* tests between the 2 age populations. Data show that similar factorial clusters appeared for both S groups, but that the levels of loading were different. Difference between groups occurred for perceptual and not language behaviors. It is suggested that prescriptive teaching techniques should be selected on the basis of both the age and compensatory behavioral strengths of the Ss.—*Journal abstract*.

5682. Salamon, Jenő & Kalmár, Magda. (Eötvös Lóránd U., Budapest, Hungary) **A cselekvései matematikaoktatás hatása alsó tagozatosok elemi konstruáló tevékenységére.** [The influence of mathematics through action on the elementary constructing activity of primary school children.] *Pszichológiai Tanulmányok*, 1968, No. 11, 271-286.—Describes experiments which assess the influence of teaching mathematics through action on the development of thought processes that manifest themselves in pupils' constructing activity. Both experimental and control groups were given the same elementary constructing task, but $\frac{1}{2}$ of each group had to solve it on the basis of a model, while the other $\frac{1}{2}$ had to work according to a photo. It is assumed that solutions based on the model involve close transfer, and those based on the photo distant transfer. The experimental group, consisting of 2nd graders who had had the new mathematics, solved the task involving thoughtful activity when working on the basis of the model with better results after a slightly heightened preliminary orienting activity. Experimental Ss working on the basis of the photo also solved the task with better results than the controls, but solution was preceded by more thorough preliminary orienting activity, and by an increase in the repetition of inadequate operations constituting part of the trial and error strategy. Positive results in teaching new mathematics to the 7-8 yr. old Ss are to be attributed partly to the fact that teaching had been started from a lower level than is customary and to activating the perceptual processes. In this way greater attention is paid to age characteristics than to traditional teaching. (Russian summary) (22 ref.)—*English summary*.

5683. Schild, Gili. **The influence of games on school achievement abilities and attitudes.** *Center for the Study of Social Organization of Schools Report*, Johns Hopkins U., 1971(Jan), No. 92. 16 p.—Selected 524 9-13 yr. old Israeli schoolchildren to investigate the relationships of game-playing with school achievement, family background, and several psychological variables. Results indicate that game-playing was not directly related to school achievement when abilities and attitudes were controlled. However, the playing of certain types of games was related to certain attitudes and abilities which in turn were related to school achievement. These relationships were nonlinear and appeared to represent threshold effects.—*Journal abstract*.

5685. Sgan, Mathew R. (Brandeis U.) **Letter grade**

achievement in pass-fail courses. *Journal of Higher Education*, 1970(Nov), Vol. 41(8), 638-644.—Evaluated the letter grades of a random sample of 60 students in each undergraduate class taking courses on a pass-fail basis. Analysis of GPAs by class level indicates no differences for the senior Ss. The average GPAs in all other classes were significantly ($p < .01$) higher than the average GPAs in the pass-fail courses. Freshmen failed at a rate of 10% under pass-fail, whereas the rate for all freshmen was 4-5%. Factors affecting the poorer performance by all but the senior Ss are discussed in terms of courses taken, the ability of the students, and misconceptions about the nature of the pass-fail system. It is concluded that "a shift in emphasis from the nature of the student to the nature of the discipline as the basis of a pass-fail system might well be in order." An example of such a system is presented and discussed.—S. Knapp.

5687. Sinha, N. C. (Gaya Coll., India) **Need for achievement and academic attainment.** *Indian Educational Review*, 1970(Jul), Vol. 5(2), 59-63.—Investigated the relationships between need for achievement and academic achievement of 400 10th and 11th grade boys (age range, 12-16 yr.) equally divided among high and low achievers. 2 consecutive school final examination scores provided the basis for their grouping into high (55% or more) and low (below 30%) achievers. McClelland's n Achievement test was administered to the groups under neutral instructional set. Results show that McClelland's test was significantly and positively correlated with academic achievement. The obtained phi coefficient, .41, was significant at the .01 level. The findings suggest that an intensive study of need for achievement under different experimental conditions should be made to find out the criterion for predicting academic achievement.—K. C. Panda.

5688. Smith, I. Leon. (U. Cincinnati) **IQ, creativity, and the taxonomy of educational objectives: Cognitive domain.** *Journal of Experimental Education*, 1970(Sum), Vol. 38(4), 58-60.—Based on the assumptions of the *Taxonomy of Educational Objectives: Cognitive Domain* and its definitions of cognitive processes, it was hypothesized that the 1st 4 taxonomic levels are related to intelligence alone, but that performance on the upper 2 levels would require creative and intellectual abilities. The Lorge-Thorndike Intelligence Test, 2 creativity tests, and taxonomic tests were administered to 141 11th graders. Multivariate stepwise regression procedures were employed to determine the contributions of IQ and creativity to variation on the taxonomic tests. Results support the hypotheses. Implications are discussed in relation to B. S. Bloom's model of mastery learning and the teaching for creativity.—*Journal abstract.*

Bridgeport) **Expectancy, achievement, and self-concept correlates in disadvantaged and advantaged youths.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 561-562.—In measuring the relationship of aspirational level, academic achievement, and self-concept of disadvantaged youths, it was found that disadvantaged boys indicated a higher expectation as to final grades than advantaged boys but lower achievement. They also

had a significant discrepancy between expected and actual grades, while advantaged boys were more realistic in terms of aspiration and achievement although significantly lower in self-concept.—*Author abstract.*

5690. Solomon, Daniel; Houlihan, Kevin A., Busse, Thomas V., & Parelius, Robert J. (Inst. for Juvenile Research, Chicago, Ill.) **Parent behavior and child academic achievement, achievement striving, and related personality characteristics.** *Genetic Psychology Monographs*, 1971(May), Vol. 83(2), 173-273.—Indices of academic achievement, achievement-related behavior, behavior with parents, and personality characteristics were obtained for 72 lower-class Negro 5th graders in several school settings and in a home problem-solving session in which the behavior of their parents, who participated and helped with a series of tasks, was also observed. Numerous relationships were found between parent behavior and child achievement and related personality characteristics. In addition, there were several combined relationship sets in which child personality and behavior variables appeared to serve intervening functions between parent behavior and child achievement. (43 ref.)—*Author abstract.*

5691. Tennyson, Robert D. (Brigham Young U.) **Instructional variables which predict specified learner concept acquisition and errors.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 551-552.—2 experiments were conducted to investigate variables which predict learner response patterns in concept acquisition. In Exp. I, the independent variables were: (a) relationship of exemplars with nonexemplars, (b) probability ratings of exemplars and nonexemplars, and (c) relationship of exemplars to each other. For Exp. II, no nonexemplars were included. The manipulation of the variables hypothesized 4 dependent outcomes: (a) correct classification, (b) overgeneralization, (c) undergeneralization, and (d) misconception. 7th graders from 3 school districts were selected as the 260 Ss. The predicted outcomes for Exp. I were significant at $p < .01$. Exp. II Ss had random response patterns on the posttest instead of predicted errors.—*Author abstract.*

5695. West, Charles K., Lee, J. Frank, & Anderson, Thomas H. (U. Illinois) **The influence of test anxiety on the selection of relevant from irrelevant information.** *Journal of Educational Research*, 1969(Oct), Vol. 63(2), 51-52.—Tested 58 6th and 8th graders with the Test Anxiety Scale for Children and 1 of 2 forms of an achievement test. 1 form of the achievement test (selectivity high) contained no irrelevant information, and the other form contained irrelevant information in each item (selectivity low). Analysis of variance indicates a significant effect for selectivity forms of the test ($p < .01$) and an interaction between selectivity and test anxiety ($p < .05$).—*Journal abstract*.

Prediction

5696. Biggs, Donald A. & Tinsley, Diane J. (U. Minnesota) **Student-made academic predictions.** *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 195-197.—Describes a measure of student-made academic predictions, and examines the relationships between these predictions and measures of college aptitude and college freshman grades. Predictions were measured using the College Opinion Survey (COS), an adaptation of the Michigan State General Self Concept of Ability to Learn Scale. COS is an 8-item inventory including both academic self-acceptance and self-evaluation ratings. Individuals respond in terms of various academic reference groups. Information was collected on 2 freshman samples ($N = 134$) and 1 sophomore sample ($N = 118$). Findings indicate that student-made predictions as measured by the COS are related to college achievement even when differences in college aptitude are controlled.—*Journal abstract*.

5697. Binder, Dorothy M., Jones, John G., & Strowig, R. Wray. (St. Xavier Coll.) **Non-intellective self-report variables as predictors of scholastic achievement.** *Journal of Educational Research*, 1970(Apr), Vol. 63(8), 364-366.—Compared 2 studies with a total of 335 male and 328 female 12th graders. The utility of 2 non-intellective variables, self-expectations and self-concept of ability, as predictors of scholastic achievement was examined. Because of its established predictive potential, academic aptitude was included as an independent variable in the multiple regression equations. Results show no significant differences in the 2 female samples. A significant difference was found in the coefficients of the 2 male samples. The sheer magnitude of the multiple correlations was noteworthy. When the nonintellective variables were added to the regression equations, a sizeable gain in explaining variance in scholastic achievement was made over that usually reported.—*Journal abstract*.

5698. Borgen, Fred H. **Differential expectations? Predicting grades for black students in five types of colleges.** *National Merit Scholarship Corporation, Research Reports*, 1971, Vol. 7(2), 8 p.—Compared the precollege characteristics and college performance of 477 male and 837 female black students who had been nominated by their high schools for participation in the 1st annual National Achievement Scholarship Program. Ss returned a questionnaire following their freshman year and were grouped according to their attendance at 5 types of colleges: predominately black—public or private; predominately white—high, moderate, or low selectivity. Statistically significant correlations were

found between scores of the National Merit Scholarship Qualifying Test (NMSQT) and freshman grades. Several of the relationships were modest, particularly for the highly selective colleges. An inverse relationship was found between GPAs and average NMSQT scores at the black and white colleges. It is concluded that the college performance of the average black student is a joint function of his level of educational development (e.g., NMSQT) and the type of college he attends.—*Journal abstract*.

5699. Bradley, Richard W. & Sanborn, Marshall P. (Southern Illinois U.) **Using tests to predict four-year patterns of college grade point.** *Journal of College Student Personnel*, 1971(Mar), Vol. 12(2), 138-142.—Employing a developmental approach based upon improvement, decline, variation, and consistency of high-school grades, 354 university students participated in a study to determine the predictability of their college GPA. The 4 content areas used as predictor measures were abstract reasoning, quantitative, reading, and verbal. Results indicate that the null hypothesis could not be rejected. Thus, patterns of post-high-school academic performance cannot be predicted from longitudinal high school test performance.—R. H. Mueller.

5700. Bruininks, Robert H. & Lucker, William G. (U. Minnesota) **Change and stability in correlations between intelligence and reading test scores among disadvantaged children.** *Journal of Reading Behavior*, 1970(Fal), Vol. 2(4), 295-305.—Reports correlations between intelligence and reading test scores using a longitudinal approach. 36 elementary-aged Ss, mostly Negro, were used. Increments in correlations between IQ and reading test scores from the 1st to the 4th grades were found. Results suggest that vocabulary ability becomes highly associated with reading performance as the child advances through school. IQ scores are good predictors of later reading performance but are poor predictors of early reading performance. Test-retest reliability coefficients on the Stanford-Binet and Peabody Picture Vocabulary tests were high enough to indicate that the IQ scores are relatively stable with disadvantaged children. Several explanations are given for the rise in correlations between IQ and reading scores with age.—W. L. Chovan.

5701. Dawes, Robyn M. (Oregon Research Inst., Eugene) **A case study of graduate admissions: Application of three principles of human decision making.** *American Psychologist*, 1971(Feb), Vol. 26(2), 180-188.—Reports that 3 principles of human judgment apply to the decisions of a graduate admissions committee. The 1st of these principles is that a linear combination of the variables considered by the committee does a better job of predicting graduate success than does the committee; the 2nd principle is that the committee's judgment may itself be represented "paramorphically" by a linear combination of these variables, and the 3rd that this paramorphic representation is superior to the committee in predicting graduate success. (42 ref.)—*Author abstract*.

5702. Jones, John G. & Grieneeks, Laurabeth. (U. Oklahoma) **Measures of self-perception as predictors of scholastic achievement.** *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 201-203.—Certain non-intellectual variables recently have been developed and have proven to have meaningful relationships to academic achievement. These instruments were administered to 411 female and 466 male undergraduates. The

nonintellectual measures employed were the Identity Rating Scale, Self-Concept of Ability, and Self-Expectations Inventory. These, along with a measure of scholastic aptitude, were used to predict scholastic achievement. All variables were positively associated with achievement and all, with the exception of self-expectation and scholastic aptitude were positively associated with each other. It was inferred that, at this developmental period, self-perception appears to be the most accurate predictor of academic achievement. —*Journal abstract.*

5703. **Keefer, Karl E.** (U. Tennessee, Memphis) **Self-prediction of academic achievement by college students.** *Journal of Educational Research*, 1969(Oct), Vol. 63(2), 53-56.—At the beginning of 4 grading periods of a school year, 154 undergraduates predicted their grades. Self-predicted GPAs (SP GPA) were correlated with achieved GPAs (Ach GPA)—the criterion—for each grading period. These were compared with correlations using the composite standard score on the American College Test (ACT) and the high school total GPA (HS GPA) in place of the SP GPA, and with correlations between Ach GPAs at consecutive grading periods. SP GPA yielded significantly higher ($p < .01$) correlations than ACT or HS GPA at the 2nd and 4th grading periods. Previous Ach GPA yielded significantly higher ($p < .01$) correlations than all other predictors. When correlations were computed by academic classification, SP GPA maintained its stability regardless of classification. Correlations using HS GPA or ACT tended to decrease after the freshman year. Correlations using Ach GPAs remained consistently high for all classifications. —*Journal abstract.*

5704. **Lewis, Vern C.** (Biola Coll.) **Prediction of academic performance from adolescent attitude-press organizations.** *Journal of Educational Research*, 1970(Jan), Vol. 63(5), 204-208.—Attempted to produce nonintellective variables from adolescent attitude-press organizations that would combine with IQ and other known predictor variables to increase the predictability of academic performance in mathematics and English. This study was based on a phenomenological theory of cognitive consistency stipulating that the higher a student's score on scales of attitude-press items toward given subjects, the more likely it would be that he is or would be doing well in that subject. The attitudes of students toward the perceived academic presses emanating from parents and peers were obtained from a sample of 227 high school juniors. Results demonstrate that the attitude-press variables made a significant contribution to the increased prediction of academic performance in each area. —*Journal abstract.*

5705. **Merenda, Peter F. & Reilly, Raymond.** (U. Rhode Island) **Validity of selection criteria in determining success of graduate students in psychology.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 259-266.—Validated a set of 6 predictor variables against a discrete criterion measuring success in graduate study in psychology. The predictors were: (a) total undergraduate GPA, (b) GPA in psychology courses, (c) the 3 Graduate Record Examinations (GREs), and (d) a rating of the college in which the baccalaureate degree was earned. The criterion was trichotomized into: 2 success-level categories and a failure category. Multiple discriminant analysis of the data, based on a sample of 77 students who had been admitted to graduate study in psychology, yielded a statistically significant value of D^2 ($p < .001$).

The greatest weight in providing the maximum separation among the 3 criterion groups was assumed by total GPA, GRE-Advanced score, and the grades in undergraduate psychology courses. —*Journal abstract.*

5706. **Miller, Robert E.** (Lackland Air Force Base, Personnel Research Div., Tex.) **Predicting first year achievement of Air Force Academy cadets, class of 1968.** *USAF AFHRL Technical Report*, 1968(Jul), No. 68-103, 14 p.—Candidates for admission to the Air Force Academy are required to demonstrate their qualifications on a battery of selection tests. Successful candidates, upon admission to the Academy, are administered a battery of experimental tests as part of a program for the development of officer selection and classification instruments. The experimental tests are not used in making decisions affecting cadets, but both the selection and experimental batteries are validated against criteria which become available at the end of the 4th class (freshman) yr. The criteria used for the validation study in the class of 1968 were the Academic Standard Score, Military Rating, Extracurricular Activities Standard Score, Composite Standard Score, and Early Motivational Elimination. Selection tests common to the classes of 1967 and 1968 tended on the whole to be slightly less valid in the class of 1968. However, the nonacademic selection tests were somewhat more valid in the class of 1968 as predictors of the Military Rating. All criteria were validly predicted by 1 or more of the experimental tests, but no set of experimental tests was found which contributed uniquely and validly to prediction of the Academic Standard Score or Extracurricular Activities Standard Score in the context of the selection tests. The highest multiple correlations with these criteria were .60 and .41, respectively. Sets of experimental tests were found which contributed uniquely and validly to prediction of the Military Rating and Early Motivational Elimination in the context of the selection tests. The highest multiple correlations with these criteria were .54 and .25, respectively. The Composite Standard Score, because of its high correlation with the Academic Standard Score, was not used in any multiple regression analysis. The best predictor of this criterion was the Academic Composite, composed of selection tests. Its validity was .51. —*USAF AFHRL.*

5707. **Molnar, George E., DeLauretis, Robert J., & LeBold, William K.** (Purdue U.) **Discriminant and regression models of college persistence and vocational decisions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 519-520.—Examined the efficiency of precollege data, 1st-semester GPA, and interest scores in predicting the 7th-semester classification of 904 students who originally enrolled in a freshman engineering department. The statistical method used was multiple discriminant analysis. Ss were classified with regard to both university status and specific field of study. The percent of correct classifications ranged from 51-82. The most dominant predictor was 1st-semester GPA, although the interest scores consistently demonstrated statistical significance. Also, the comparability of multiple point-biserial correlation to simple linear discriminant function was shown empirically. —*Author abstract.*

5708. **Speedie, Stuart; Hobson, Sandra; Feldhusen, John, & Thurston, John.** (Purdue U.) **Evaluation of a battery of noncognitive variables as long-range predictors of academic achievement.** *Proceedings of the Annual Convention of the American Psychological*

Association, 1971, Vol. 6(Pt. 2), 517-518.—Attempted to answer the following questions: (a) Which of a battery of biographical, interview, attitudinal, and projective variables are significant long-range predictors of academic achievement? (b) What are the multiple correlations of the optimum batteries of these predictors with 4 indices of academic achievement? Predictor data were secured on 265 3rd, 6th, and 9th graders, and their academic achievement was assessed 8 yr. later. Multiple Rs up to .64 were found. The best long-range predictors were a measure of aggressive traits and the Kvaraceus Delinquency Proneness subscale for items related to school.

Author abstract

5709. Tseng, M. S. & Sonstegard, M. A. (West Virginia U.) Identifying preschool children with learning problems. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 563-564.—A longitudinal project beginning with preschool and extending through Grade 10 was designed to study child behavior in the school for the purpose of identifying variables which inhibit social and academic adjustment and to establish criteria for the identification of preschool children with learning problems. 17 personal characteristics rated by 6 professional Os and 7 measures acquired from parents through interview at the kindergarten year were examined as determinants of the children's educational development during the subsequent years (Grades 1-10). Among the significant correlates ($p < .05$) of academic development found were general attitude, self-confidence, attention span, cooperativeness, discouragement, parents' handling of children's hassles, and parents' attitude toward children. Results of a 1-way analysis of variance conducted to compare underachievers and achievers are also presented, and the possible impact on preschool education is discussed.—*Author abstract*.

5710. Wiggins, Nancy; Blackburn, Margaret, & Hackman, J. Richard. (U. Illinois) Prediction of first-year graduate success in psychology: Peer ratings. *Journal of Educational Research*, 1969(Oct), Vol. 63(2), 81-85. Compared a variety of measures in predicting 1st-yr GPA in graduate school in psychology. The predictors included standard ability measures, e.g. the Graduate Record Examination, biographical characteristics, peer ratings on intellectual and personality variables, and scales from the Opinion, Attitude, and Interest Survey. The samples involved 46 psychology 1st-yr students in 1965 and 58 students in 1966. Results indicate that among all predictors only the peer ratings demonstrated predictive validity of 1st-yr grades (19 ref.)—*Journal abstract*.

Overachievement & Underachievement

5711. Bachtold, Louise M. (U. California, Davis) Personality differences among high ability underachievers. *Journal of Educational Research*, 1969(Sep), Vol. 63(1), 16-18.—Studied personality characteristics of 227 achieving and underachieving bright 5th grade students with the Children's Personality Questionnaire. Underachievers were grouped on the basis of (a) low grades, (b) low achievement test scores, and (c) both low grades and achievement scores. Credulity, self-confidence, and self-control were components in successful female achievement; emotional stability, seriousness, and sensitivity were components in successful male achievement. Underachievers differed in personality factors according to type of underachievement. Under-

achieving female groups differed in credulity, self-confidence, self-control, and excitability. Underachieving male groups differed in emotional stability, cheerfulness, and sensitivity. Remediation should consider variation in need as related to sex and type of underachievement.—*Journal abstract*.

5712. Kirkendall, Don R. & Gruber, Joseph J. (U. Kentucky) Canonical relationships between the motor and intellectual achievement domains in culturally deprived high school pupils. *Research Quarterly*, 1970(Dec), Vol. 41(4), 496-502.—Utilizing canonical correlation analysis, the multivariate relationship between selected measures of motor performance and intellectual achievement was studied on 91 high school pupils. The Ss were culturally deprived students who had been achieving well below their expected capacity. A significant relationship was found between the intellectual achievement and motor performance domain. Also, significant relationships were found between the intellectual achievement domain and both subdomains of fitness and coordination. Results are compared with the univariate analyses in a previous study. It is concluded that when the degree of relationship between 2 domains is desired, canonical correlation analysis may be of more value than the usual univariate procedures. (25 ref.)—*Journal abstract*.

5713. Mehta, Prayag & Dandia, P. C. (Indian Inst. of Mass Communication, New Delhi) Motivation training for educational development: A follow-up study of bright underachievers. *Indian Educational Review*, 1970(Jul), Vol. 5(2), 64-73.—Reports the findings of a follow-up study of teachers and pupils who were earlier identified as bright underachievers in Grade 9, about 1 yr. after they were given motivation training. Pupils who had received training in achievement motivation 1 yr. before continued to show stable and significantly higher gains in need for achievement than those who did not. The additional treatment of classroom goal-setting ceased to give extra benefit to the pupils as far as the gains in need for achievement were concerned. However, pupils who were given either training in achievement motivation or in classroom goal-setting showed more significant scholastic achievement than pupils who received both the training and/or no training. Teachers continued to maintain their gains in need for achievement 9 mo. after they had completed teaching the achievement motivation course to their pupils and 1 yr. after their own training. [Age when school starts: I. pedagogic explanation.] *Skolepsykologi*, 1970, Vol. 7(2), 106-112. Lower-age children profit from school as well as mean-age children. The critical problem is not age but socioeconomic level and sex. Boys from low levels dominate as failures after starting school.—P. Mylov.

5716. Smith, Leland. (U. Kentucky) A 5-year follow-up study of high ability achieving and non-achieving college freshmen. *Journal of Educational Research*, 1971(Jan), Vol. 64(5), 220-222.—Describes a 1966 follow-up study investigating the present status and significant differences between 50 high ability achieving

and nonachieving male college students of a 1960 study. Ss had scored in a percentile range of 95-99 on the College Qualification Tests. The psychosocial data were collected by means of a questionnaire, and significant differences were determined through the chi-square method of statistical analysis. The resulting profiles indicate the possibility that many high ability non-achievers might achieve if they were given early guidance and were allowed the opportunity to change their academic programs.—*Journal abstract.*

CURRICULUM & PROGRAMS

5717. Asbury, Charles A. (Fayetteville State U.) **Some effects of training on verbal mental functioning in Negro pre-school children: A research note.** *Journal of Negro Education*, 1970(Win), Vol. 39(1), 100-103.—20 4-6½ yr. old preschool children enrolled in a private church-related kindergarten were administered the Primary Mental Abilities test, Form K1. After the pretest Ss were "blocked" and randomly assigned to an experimental and a control group. Experimental group Ss received teaching from the Peabody Language Development Kit for 45 min/day for 15 days. Controls received "normal" kindergarten routine. Using the t test for correlated samples, results indicate that there were no significant differences between groups on the posttest. It is concluded that specialized training of Negro preschool children for a short period of time does not result in improved verbal ability.—*W. E. Sedlacek.*

5718. Berke, Melvyn A., Johnson, Edward E., & Stabler, John R. (Myers Child & Adolescent Center, Dallas, Tex.) **Children's discrimination learning as a function of type of reinforcement and amount of preschool experience.** *Psychology*, 1971(Feb), Vol. 8(1), 54-57.—Studied performance on a discrimination learning task as a function of 4 reinforcement conditions and amount of preschool experience. Children enrolled in a Head Start program for either 1-3 mo. or 10-12 mo. learned faster than matched non-Head Start children. Generally, no incentive effects were obtained, but non-Head Start children required more trials to criterion under promised reward conditions than under immediate reward conditions. Results were interpreted as evidence that there are beneficial consequences associated with attending Head Start.—*J. A. Blazer.*

5719. Bersoff, Donald N. & Ericson, Colleen R. (Ohio State U.) **A precise and valid measure of behavior and behavior change.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 555-556.—Suggests a method for the direct and continuous observation of behavior as it occurs in the naturalistic environment (classroom) as an alternative to individual testing and other observational techniques, especially those which use predetermined time segments and chart behavior in percentages. The method—behavior rates—using a base of movements/min is seen as increasing the information obtained/unit of assessment time and providing daily accurate feedback concerning the efficacy of a behavioral strategy. A case report employing the method is used for illustration.—*Author abstract.*

5723. Deterline, William A. (Deterline Assoc., Los Altos, Calif.) **A curriculum is a set of specifications of which of the following: A. stimuli, B. responses, C. both A and B, D. neither A nor B.** *Educational Technology*, 1970(Apr), Vol. 10(4, Pt. 1), 48-49.—Discusses the fact that curriculum design and development have traditionally been stimulus oriented, with teaching materials constituting "a package" of such stimuli. It is felt that problems of effective teaching will not be resolved until the curriculum becomes more response oriented around the student. Some of the objections to this more response-oriented curriculum are described.—*S. Knapp.*

5724. Ducette, Joseph & Wolk, Stephen. (Temple U.) **The limitations of the interaction hypothesis in regard to ability grouping.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 525-526.—Focuses on the question of an interaction over time between ability grouping and personality variables, and examined pertinent data from 260 female high school students. 2 standardized personality instruments (Test Anxiety Questionnaire and the Mehrabian scale measuring need to avoid failure and need for achievement), in addition to several scales designed by the Es, were administered to students of the upper and lower ability tracks in a Catholic high school. Grades 9 and 12. Ss in the lower track were found to have a lower need for achievement, a higher need to avoid failure, and a higher average score of test anxiety than Ss in the upper track. The effects of ability grouping did interact with grade level for a correlate of personality, level of aspiration. Relative to Ss in the upper track, lower track Ss experienced a reduction in level of aspiration over time. Both future directions of associated research and educational practices are discussed within the context of the present findings. *Author abstract.*

5725. Dunn, John P. (Texas A & M U.) **The relationship between strength and selected social and personality factors.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3318.

5726. Eisenman, Russell. (Temple U.) **Complexity-simplicity, experience, and ratings of a textbook.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 958.—Investigated the effects of a personality measure, preferences for polygons varying in complexity-simplicity, and 1 background index, i.e., number of semester hr. in psychology. Ss were 60 psychology students who rated their text, Shaffer and Shoben's *The Psychology of Adjustment* on a 1-7 scale. Results suggest that the text may be inappropriate for advanced students and that a personality and background index are related to an aspect of student preference.—*P. Herzberg.*

John, & Rivkin, Marian. Giant steps: A game to enhance semantic development of verbs. *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Sep), No. 81, 36 p.—Describes a game "Giant Steps," designed to aid in the semantic development of verbs. It can be made suitable for children in all the elementary grades by changing the story base. An experimental evaluation of the game conducted with 45 3rd grade inner city children demonstrates that the game does foster the desired kind of development. Results are discussed in the context of current research on reading.—*Journal abstract.*

5728. Epps, Edgar G. (Tuskegee Inst.) **Interpersonal relations and motivation: Implications for teachers of disadvantaged children.** *Journal of Negro Education*, 1970(Win), Vol. 39(1), 14-25.—Describes the relationship between interpersonal relations and development of personality traits and attitudes associated with academic success or failure of disadvantaged students. It is concluded that: (a) the same socialization practices that lead to high achievement motivation also lead to low anxiety, (b) parents, siblings, and peers are responsible for the child's learning to value academic skills, and (c) the development of a strong sense of personal competence requires a history of interpersonal relationships with reward skill. In discussing implications for education, it is pointed out that: (a) parents should be involved as much as possible in the early school years, (b) racially integrated classes heterogeneous in socioeconomic distribution are likely to result in increased academic motivation for disadvantaged youngsters, (c) the child who tries should be rewarded regardless of how he performs, (d) success breeds success, and (e) pupils learn what teachers expect them to learn.—*W. E. Sedlacek.*

5729. Gájer, Samo. (Comenius U., Bratislava, Czechoslovakia) **Skúmanie postupov tvorby písomného záznamu o telocvičnom pohybe.** [Written recording of gymnastic movements.] *Studia Psychologica*, 1970, Vol. 12(4), 271-281.—Discusses a descriptive movement process where physical exercise is described in special gymnastic terminology in order to expedite the learning process. 2 description schemes were tested on 30 14-15 yr. old students in a sports school and 28 undergraduates in physical training. Achievement in mental processing of a written text was rated by a nonstandard test and a mathematical model. It is concluded that (a) the word-order arrangement of a grammatical-logical structure affects the course of perception of processing of written information; and (b) the most successful word arrangement follows the order of place, starting position, movement, and final position. (Russian summary) (30 ref.)—*English summary.*

5730. Geis, George L. (U. Michigan) **Premature instruction.** *Educational Technology*, 1970(Apr), Vol. 10(4, Pt. 1), 24-30.—Proposes that in the design and development of any instructional system, the problem of how to teach should be approached only after one has examined the question of when and what to teach. The 1st concern of the instructional designer should be the definition and demonstration of goals and needs at the societal level. Solutions to problems created by the needs may involve changing human behaviors. Furthermore, only those elements of the solution which do involve behavior change are likely to require instructional systems. No system should be developed until an inventory of relevant constraints and available resources is constructed and a plan for maintaining learned

behavior is devised. The decision to design and develop new instruction (or improve the old) should be arrived at cautiously, only after excluding all other alternatives. The instructional systems that finally do emerge from this decision process will be undeniably relevant and must, inescapably, become efficient.—*Journal summary.*

5731. Golin, Sanford. (U. Pittsburgh) **Project self-esteem: Some effects of an elementary school black studies program.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 733-734.—The development of a negative self-concept has been viewed as beginning early in the life of the Negro child. This report presents results of a project whose goal it was to develop "black consciousness" in Negro elementary schoolchildren. 200 students participated in activities designed to develop racial awareness and pride through the 5th and 6th grades. A measure of emotional adjustment was given to project children and a comparable control group at the beginning and end of the project. Results indicate that the project had a significant positive effect on the mental health of male children.—*Author abstract.*

5732. Guthrie, John T. **Learnability versus readability of texts.** *Center for the Study of Social Organization of Schools Report, Johns Hopkins U.*, 1970(Sep), No. 80, 29 p.—Distinguishes between the learnability and readability of text materials. Learnability is defined as the extent to which new learning results from reading a passage, and readability as the extent to which a passage is comprehended. The prediction of new learning with a variety of text variables was examined. 62 6th grade Catholic schoolchildren read 11 passages ranging from 2nd to 12th grade difficulty. Learning scores were based on 2 types of pre- and posttests. Results of stepwise regression analyses of text characteristics on learning scores reveal that the same characteristics, including word difficulty and sentence length, which predict comprehension also predict new learning. However, more than 1 text characteristic in a multiple regression equation did not significantly improve the predictability over the 0 order correlation. It is concluded that the classic readability formulas may be used to estimate the learnability as well as the readability of text materials.—*Journal abstract.*

5742. Moffitt, P. & Nurcombe, B. (U. New South Wales, Kensington, Australia) **Action research: A pre-school for rural aborigines and Europeans.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 243-248.—Describes the establishment of a preschool kindergarten involving the active participation of aborigines and Europeans in a rural area of New South Wales. About 45 4 yr. olds were enrolled in 1970. 1/2 the Ss were being exposed to conventional preschool kindergarten activities, involving free play in an environment enriched with appropriate equipment. The other 1/2 were in a more structured classroom situation, stressing direct language stimulation. The 2 programs were compared for effectiveness in terms of IQ and language gains. It is concluded that of great importance was attention to differing cultural values. The success of the program was evaluated in terms of its acceptance by the majority of families who enrolled their children, including aborigine families.—*H. Roemmich.*

5743. Nedler, Shari & Sebera, Peggy. (Southwest Educational Development Lab., Commodore Perry Hotel, Austin, Tex.) **Intervention strategies for Spanish-speaking preschool children.** *Child Development*, 1971(Mar), Vol. 42(1), 259-267.—Compared 3 strategies of early intervention designed to increase the language and communication skills of disadvantaged 3-yr-old Mexican-American children. Treatment Group 1 (T₁) included 16 Ss in a planned Bilingual Early Childhood Educational Program. Group T₂ included 16 Ss who were indirectly involved in a Parental Involvement Program. Group T₃ was composed of 14 Ss in a traditional day-care center. Before and after a 9-mo intervention period, all Ss were tested with the Leiter International Performance Scale and the Peabody Picture Vocabulary Test in English and Spanish. On all measures, T₁ made significantly greater gains than T₂ or T₃, indicating the greater effectiveness of the planned Bilingual Early

Childhood Education Program.—*Journal abstract.*

5744. Nurcombe, B. & Moffitt, P. (U. New South Wales, Kensington, Australia) **Cultural deprivation and language defect: Project Enrichment of Childhood.** *Australian Psychologist*, 1970(Nov), Vol. 5(3), 249-259.—Describes 1 of 4 Aboriginal ways of life, the fringe-dwellers. Traditional Aboriginal folkways have been supplanted in this way of life by a culture of poverty. Attitudes harbored by these people and their way of life are described. The area of preschool education is noted as a special problem area, and various approaches to this problem are described. An experimental program under the auspices of the University of New South Wales is reported. An evaluation of this program is included. (16 ref.)—*H. Roemmich.*

5745. O'Connor, Colleen. (Texas Technological Coll.) **Effects of selected physical activities upon motor performance, perceptual performance and academic achievement of first graders.** *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 703-709.—Effects of 2 treatments, traditional physical education and physical activities suggested by N. C. Kephart, showed a significant difference in favor of the Kephart activities on measures of motor ability and internal lateral awareness. Ss were 59 male and 64 female 1st graders, randomly assigned to experimental and control groups. No significant difference was found between treatments on measures of academic achievement, external lateral awareness, lateral preference, or ability to draw geometric forms.—*Journal abstract.*

5746. Orring, Jonas. **Potenciál vzdelania: Skúsenosti z organizácie práce v švédскеj základnej škole.** [Potential of learning: Experience from the organization of work in Swedish elementary schools.] *Jednotná Škola*, 1969(Jun), Vol. 21(6), 487-500.—Reports an analysis of the experience and organization in the new Swedish elementary school. The demands of the scientific-technological revolution are seen as providing the necessity for the reorganization of the school system. At the present time an individual must expect to change his profession 2 or 3 times within his productive life. The old educational system is described as inadequate to meet these conditions. Scientific surveys have shown that intelligence is not a static phenomenon, and that the ability to acquire knowledge depends considerably on the will to learn. Social conditions also play a considerable role in the process and can determine the measure of the students' success in study. The new Swedish educational system, therefore, attempts to do away with all social, economic, and geographical obstacles, and to reduce the number of young people excluded from education. Technological innovations in the teaching in the new schools are described. (Russian summary)—*English summary.*

5747. Paonessa, John J. & Paonessa, Mary W. **The preparation of boys for puberty.** *Social Casework*, 1971(Jan), Vol. 52(1), 39-44.—Discussions with groups of high school and college students revealed that boys lacked instruction concerning sexual maturation. *M. W. Linn.*

5748. Paschal, Billy J. & Williams, Richard H. (Ball State U.) **Some effects of participation in a summer Upward Bound program on the self-concept and attitude of the disadvantaged adolescent.** *Journal of Negro Education*, 1970(Win), Vol. 39(1), 34-43.—31 15-18 yr. old adolescents, consisting of 15 girls and 16 boys (21 Negroes, 6 Caucasians, 3 Cubans, and 1

But among enrolled in an Upward Bound program were administered: (a) the Maryland Self Concept as a Learner Scale (SCAL), (b) the Operation Head Start Workers Attitude Scale (WAS), and (c) the Depression Scale (depression) and after a two-month program during 1968 Using L. Wilcoxon and Mann-Whitney U tests, results indicate that Negro Students achieved only higher (0.05 level) on the Maryland sub-scale of the SCAL on both the pretest and gain scores. It is reported that Negro boys showed a "more favorable" pretreatment score pattern on the WAS than Negro girls, and Negro girls showed positive gain scores on all variables but data are not presented. Upward Bound programs are recommended. —H. J. Sussman.

5743. Pilon, Barbara. (Indiana U.) Stimulating creative writing through literature. *Review of the Society of American Teachers*, 1970(Sep), Vol. 48(6), 33-61.—The selected bibliography plus numerous references are intended as a "starter kit" for teachers who want to read and use creative self-expression and to develop writing in their students. —H. J. Sussman.

5744. Prigoff, Ira. Dialogue House, New York, N.Y.) Toward a depth humanistic psychology. *Journal of Humanistic Psychology*, 1970(Mar), Vol. 10(2), 121-130.—This address was delivered to mark the inauguration of the California Graduate Institute program in depth humanistic psychology. The institute provides a place for studying man "not as a bundle of muscles and reflexes to be controlled, but as a human being who possesses creative and spiritual potentialities." Depth humanistic psychology is the study of learning as a perspective and method to enable modern man to move through growth transitions, "entering again and again into the core cycles of death and rebirth, and emerging each time upon a new plateau of being." A new type of curriculum to replace the traditionally pathological curriculum is presented, as a transition from a "P. Sussman."

5747. Smith, Alfred S. (State U.) The importance of attitude in foreign language learning. *Modern Foreign Languages*, 1970(Sep), Vol. 23(3), 185-188.—The author discusses the role of attitude of the teacher, other school personnel, parents, and students. The author states that when a student enters the classroom he arrives with a set of attitudes. Among the negative attitudes toward the foreign language are: (a) the course is irrelevant and to be endured only for utilitarian reasons; (b) the foreign language is a barrier; (c) the fact that although the material is "new" it is presented in the same old way; (d) the feeling which Lambert calls "anomic," or hostility toward the foreign language; and (e) the feeling of being a failure. In order to cope with these negative attitudes and to develop a positive attitude, the nature of motivation and attitude itself. It is useful to

study the highly motivated student and see of him the same or better results. —H. J. Sussman.

J. Frymier, "The best teachers are those who comprehend the great mass of personal factors operating within the classroom, then observations and exacting methods, construct experiences which will be congruent with and the same direction as their pupils' expectations."

5754. Suciak, Robert F. (San Francisco) Self-selection and special educational program. *Journal of Higher Education*, 1970(Nov), 607-617.—Examined whether experimental involve a degree of self-selection large enough their outcome as part of a 4-yr study on the educational process on personality attitude and opinion survey were administered to students who volunteered for the Experimental Program and a similar group who did not. Students who volunteered differed significantly from those who did not in being relatively independent, having broader intellectual interests, and being personally more expressive, and aware of themselves. Data from while in college on attitudes toward the programs further support the differences between groups and the relative homogeneity of the group, despite widely differing views of the factor of self-selection in the development of experimental programs is discussed, and suggestions for counteracting two extreme self-selection are presented. —S. Anspach.

manifest anxiety. *Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6(Pt. 2), 541-542.*—Investigated the possibility of differential relationships between manifest anxiety and a teacher-centered vs. a student-centered mode of college classroom instruction. Results indicate disordinal interactions with 2 different subject matters and with 4-wk intervals between the administration of the anxiety and criterion measures. The student-centered approach was shown to be optimal for students low in manifest anxiety, while the converse was indicated for those high in manifest anxiety. While predictions of optimal mode were limited to those high in manifest anxiety, it is concluded that these variables disordinally interact.—*Author abstract.*

5769. Edling, Jack V. (Oregon State System of Higher Education, Monmouth) **A basic reference shelf on instructional media research.** *ERIC-Stanford, Calif., Series 1, 1967(Nov), 10 p.*—Presents an introductory research bibliography on instructional media categorized for (a) identification of significant research questions, (b) completed research, (c) measurement methodology, (d) research design considerations, (e) analysis of data, and (f) proposal and report writing. (28 ref.)—*S. Knapp.*

5770. Fleming, Malcolm I. (Indiana U., School of Education, Div. of Instructional Systems Technology) **Perceptual principles for the design of instructional materials.** *Bulletin of the School of Education, Indiana U., 1970(Jul), Vol. 46(4), 69-200.*—Intended for those who "design instructional materials or teach others to do so," this report translates the "findings and generalizations from perceptual research" and media studies into "guidelines applicable to the practical problems" of materials design. "Topics in the report include attention; perception of objects, pictures, words; perceptual processing and capacity; perceptual distinguishing and organizing; perception of size, depth, space, time, motion; perception and cognition." The emphasis, for the instructional message designer, is on vision and audition. (43 ref.)—*J. Linnick.*

5771. Francois, William F. (Marshall U.) **Programed instruction of news writing skills.** *Journalism Quarterly, 1968(Win), Vol. 45(4), 735-738.*—Programed instruction was shown to be an effective method for teaching news writing skills. Furthermore the method offers a systematic way of continuing to improve news writing instruction.—*J. A. Kline.*

5772. Gadorné-Donáth, Blanka & Hegedűs, Gyuláné. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A tanulók aktívizálhatóságának kérdése egy novellátételekani vizsgálat tükrében.** [Procedures for eliciting active participation of pupils during classes. An educational-psychological survey.] *Psychologiai Tanulmányok, 1968, No. 11, 185-198.* Reports an educational-psychological experiment with 5th and 6th graders in the course of 2 school yr. Signaling by Ss during their Hungarian literature classes was elicited by questions drawn up in advance and released at a particular moment during class. Recordings of signaling were made in 5 distinct and psychologically well prepared periods: 1 at the beginning of each school yr. to assess the unmanipulated, spontaneous activity of the Ss; and 3 later recordings when results had been influenced by previous preparation. Previous preparation included theoretical tasks on active preparation, psychological talks on individual problems and inviting subgroups of the youth organization to compete in active participation. Analysis of results indicates that any exhortation

of the educator and attempt at holding the Ss induced the activity of 25% of the group. About all the Ss appeared to be susceptible to prompting. The most striking changes from the psychologist's interview with the inhibited passive Ss. No significant differences were found between girls and boys with respect to their activity during the grammar and literature classes. (J. summary)—*English summary.*

5773. Gallagher, Paul D. (Florida State U.) **An investigation of instructional treatments and learning characteristics in a computer-managed instruction course.** *CAI Center Technical Report, Florida State U., 1970(Jul), No. 12, 94 p.*—Investigated 4 computer-managed instructional treatments to find which produced the most efficient and effective learning in graduate students. Sequencing was either S-paced or computer assigned while evaluation was conducted by instructor or by means of an S x Computer interaction. No differences were found among the 4 instructional treatments on any of 4 dependent measures: (a) pretest score, (b) final product score, (c) time to complete course, and (d) system time. Further analysis of the relationship between specific learner characteristics and course success. Ss who proved most successful in the course indicated that they liked it to be a self-paced learning situation, admitted to few feelings of anxiety, and expressed positive attitudes toward computer-managed instruction. A relationship between anxiety state and performance on task quality was found. (56 ref.)—*Journal abstract.*

5774. Glaser, Robert & Marino, Mary L. (IBM, Burgh, Learning Research & Development Center) **A basic reference shelf on programmed instruction.** *ERIC-Stanford, Calif., Series 1, 1968(Jun), 8 p.*—Presents an annotated bibliography covering instructional materials, programmed instruction, manuals for the programmer, user guides and information, and reference materials. (ref.)

5775. Hagerty, Nancy K. (Florida State U.) **Development and implementation of a computer-managed instruction system in graduate training.** *CAI Center Technical Report, Florida State U., 1970(Jul), No. 13, 10 p.*—Tested the feasibility of developing and implementing a graduate level course in computer-managed instruction (CMI) using 59 graduate students. Various approaches to both the management and the individualization of instruction were studied. The instructional logic included a motivational component. Ss bid points on his estimate of how well he would perform on a unit test. The investigation of CMI in Student x Terminal interaction was used to reduce the high cost of conventional computer-assisted instruction (CAI). This approach minimized student cost, yet incorporated the best aspects of CAI: individualized pursuit of goals, self-paced learning, immediate feedback, with automatic record keeping. (ref.)—*Journal abstract.*

5776. Hall, R. Vance; Crisler, Connie; Crandall, Sharon S., & Tucker, Bonnie. (U. Kansas) **Teachers and parents as researchers using multiple baseline designs.** *Journal of Applied Behavior Analysis, 1970(Win), Vol. 3(4), 247-255.*—2 teachers and 2 parents used 3 basic multiple baseline designs to study the effects of systematic reinforcement and extinction procedures in the classroom and at home. A single teacher concurrently measured the same behavior

teams as a technique for improving instructional achievement and efficiency. 54 9th-12th grade students were divided into 18 pairs and 18 individuals, where paired Ss were selected by mutual choice. Both groups took a 5-lesson Boolean algebra program consisting of a basic introduction to logic, set theory, and switching networks. No significant differences were found between the 2 groups on final examination scores, time variables, error rates, number of practice problems solved, criterion frame scores, or daily quiz scores. It is concluded that with 2 students at each computer-assisted learning terminal, educational costs may be substantially reduced and system efficiency increased. (32 ref.)—*Journal abstract.*

5787. Lucas, Nancy C., Harless, William G., & Thies, Roger E. (U. Oklahoma, Medical Center) **Computers in behavioral science: An experiment in learning behavior using computer-assisted instruction.** *Behavioral Science*, 1970(Sep), Vol. 15(5), 447-451.—Applies the attributes of computer-assisted instruction (CAI) to a behavioral experiment in verbal concept learning. The hypothesis states that giving the student freedom to acquire information according to his own cognitive style will facilitate his learning. 24 freshman medical students were randomly assigned to 2 groups. The control group was shown definitions of 11 physiological terms in a set order, while the experimental group was allowed to select, or structure, the order in which they saw the terms defined. The groups were carried to a criterion of correctly recalling each term 1 time. $\frac{2}{3}$ of the Ss in the experimental group showed a desire to structure the terms. However, the 2 groups showed no statistically significant differences in either the mean number of trials to criterion or in their mean scores on a retention test. Ss in the experimental group may not have been adequately motivated to become deeply involved in the organizational phase of the learning task. Ss' freedom to choose the sequence for presentation of a series of terms apparently did not result in increased efficiency during the rehearsal task. Consequently, CAI tutorial sessions might be more effective if they encourage freedom during the material integration phase rather than during initial acquisition of a rehearsal task.—*Journal abstract.*

5788. Majer, Kenneth; Hansen, Duncan, & Dick, Walter. (Indiana U., Inst. for Child Study) **Note on effects of individualized verbal feedback on computer-assisted learning.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 217-218.—Investigated the effects of 5 conditions for verbal feedback on 75 high school students in a computer-assisted instruction program. Various conditions of verbal praise used as feedback for correct answers were not significantly related to terminal performance. However, lack of positive verbal feedback significantly increased time to complete the task.—*Journal abstract.*

5789. Merrill, Paul F. (U. Texas) **Interaction of cognitive abilities with availability of behavioral objectives in learning a hierarchical task by computer-assisted instruction.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3345-3346.

5790. Merrill, Paul F. & Towle, Nelson J. (Florida State U.) **Interaction of abilities and anxiety with availability of objectives and/or test items on computer-based task performance.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 539-540.—Investigated the effects of behavioral objectives and/or criterion test

items on the learning process. The 123 Ss were randomly assigned to either an example-only, an objective-only, or an objective-test-example group. Objectives significantly increased the amount of time Ss spent studying the example displays. A significant Ability \times Treatment interaction revealed that display latency had a negative relationship to reasoning ability for Ss in the test-example and objective-test-example groups, but was not related to reasoning ability in the example-only and objective-example groups. Differential relationships between state-anxiety and treatment were also observed.—*Author abstract.*

5791. Meyen, Edward L., Frank, Alan R., & Rodvick, Myron. **Special class teachers as field testing evaluators.** *Training School Bulletin*, 1971(Feb), Vol. 67(4), 198-205.—Examines the feasibility of using special education teachers as evaluators of instructional materials. 19 junior high teachers were given instructional packages to use in their classrooms with directions to evaluate each lesson as well as the total unit. It was determined that teachers were able to make very useful comments in redesigning materials before final publication.—*Journal abstract.*

5792. Politzer, Robert L. (Stanford U.) **Toward individualization in foreign language teaching.** *Modern Language Journal*, 1971(Apr), Vol. 55(4), 207-212.—Briefly discusses the convergence of trends causing the present renewed and intensified interest in individualization in foreign language teaching: (a) reactions against a curriculum that tends to neglect individual differences; (b) present tendencies in learning theory which stress the role of the learner rather than the role of the teacher; (c) emergence of the "new style" psychological research which studies treatment aptitude interaction rather than the differential results of different treatments; (d) greater flexibility in the administrative framework; (e) technological advances, especially in the utilization of the computer for instructional purposes; and (f) the abandoning of foreign language requirements as part of general education. "Individualization of instruction seems the best response which Foreign Language Education can make in the present situation. It represents a challenge that must be met. Foreign Language Education is to continue to make an important and worthwhile educational impact."—*ILR abstract.*

5793. Puryear, Ruby H. (Columbia U.) **The effect of direct teaching on representational categorization in disadvantaged Negro kindergarten children.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3349-3350.

5794. Reibel, David A. (U. York, England) **Language learning analysis.** *IRAL: International Review of Applied Linguistics*, 1969(Nov), Vol. 7(4), 283-294. Discusses the principle that a "course designer must write his teaching material on the basis of a detailed analysis of various parameters of texts of the target language e.g., frequency, usefulness, business, or productiveness of lexical or structural items." It is unnecessary for the teacher to control the selection and sequencing of lexical, phonological, or grammatical elements. Instead the learner should receive materials that represent real language being used in real situations. (French & German summaries) (37 ref.)—*M. West.*

5795. Reinert, Harry. (Edmonds School District, Wash.) **Practical guide to individualization.** *Modern Language Journal*, 1971(Mar), Vol. 55(3), 156-160.—Presents a plea for individualization—the development

of courses which have flexibility and significance to students in foreign language programs. It is emphasized that individualization does not mean independent study or programmed learning. The term is more closely related to attitudes than to methods. A description of an improved foreign language program in Edmonds, Washington, mapping its conversion from a traditional course to an individualized one, shows that the new program is beginning to have an impact toward creating more positive attitudes among students and teachers alike toward foreign language study. *JLBA*

5296. **Rusner, Jerome.** (U. Pittsburgh, Learning Research & Development Center) **Phonic analysis training and beginning reading skills.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 533-534. Phonic analysis skills correlate highly with reading ability. This study probed (a) the possibility of training such skills with beginning 1st graders, and (b) the effect of the training upon reading performance. 16 illiterate 1st graders with equivalent analysis skills were stratified according to IQ and randomly sorted into 2 groups. All were given reading instruction. 1 group only was given 49 training sessions. Posttest scores show significant differences between groups in phonic analysis skills ($p < .005$), reading words drawn from their instructional material ($p < .008$), and reading unfamiliar words constructed from familiar graphemes ($p < .0005$). Educational implications are discussed. *Author abstract*

5297. **Rothkopf, Ernst Z.** (Bell Telephone Lab., Inc., Murray Hill, N.J.) **Towards a conceptual model of learning from written discourse: A review of experimental findings on the mathemagenic effects of adjunct questions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 507-508. Presents a review of the experimental literature and a theoretical discussion of the conditions under which testlike events such as adjunct questions influence learning from written instructional materials. 2 roles of adjunct questions—rehearsal and the control of mathemagenic activities—are discussed. The review of the factors that influence the rehearsal role of adjunct questions includes trace consolidation mechanics and alteration of the effective discriminative stimulus. Mathemagenic effects are considered in terms of entering behaviors of students, distribution of relevant sentences in the text, nature and frequency of adjunct questions, question source, question placement, and relationship to inspection rate. *Author abstract*

5299. **Scanland, Francis W.** (Florida State U.) **An investigation of the relative effectiveness of two methods of instruction, including computer-assisted instruction, as techniques for changing the parental attitudes of Negro adults.** *CU Center Technical Report*, Florida State U., 1970(Jul), No. 13, 74 p. Investigated the possibility of applying computer-assisted instruction to the task of changing attitudes of Negro parents toward the value of education for their children. The study was based on the theory that more positive attitudes would aid in solving the social problem of low educational achievement of Negroes in the South. A program of achievement was written, and, after translation into Coursewriter II computer language, entered in an IBM

1440 computer. A remote terminal located in a rural school was used by 22 Negro parents of schoolchildren. Concurrently the same material was given to 23 Ss by lecture discussion method, and a 3rd group of 22 Ss received no instruction. All Ss were administered pre- and posttests designed to measure attitudes toward education and related matters as well as an achievement test following the instruction phase. Results indicate that Ss attitudes were significantly and positively changed by the computer-assisted instruction and were not changed significantly by the lecture discussion instruction. It is concluded that computer-assisted instruction is a technique with high potential for application to adult education. (63 ref.) *Journal abstract*

5801. **Shulman, Lee S.** (Michigan State U.) **Psychological controversies in the teaching of science and mathematics.** *Science Teacher*, 1968(Sep), Vol. 35(6), 34-38, 89-90. Compares 2 major approaches to the understanding of learning in education: (a) learning by discovery as presented by J. S. Bruner, and (b) guided learning and instruction as developed by R. M. Gagne. The manner in which these 2 approaches may be applied to the teaching of a particular topic is presented. The 2 positions are compared with respect to instructional objectives and styles, readiness for learning, and transfer of training. Implications of this controversy for instruction in science and mathematics are examined. *P. McMillan*

5802. **Snow, Richard E.** (Stanford U.) **Research on media and aptitudes.** *Unpublished*, 1970(Sep), Vol. 166/1, 63-89. Aptitude-treatment interaction (ATI) research in education attempts to ascertain "in what manner do the characteristics of learners affect the extent by which they attain the outcomes from each of the treatments that might be considered." Or, considering a particular learner, which treatment is best for him? With respect to media research then, a prime task is to define some initial stimulus and person characteristics. Their extent can be assessed for ATI hypothesis and the final question is then laid for the design of ATI research on media. It is concluded that there is a need for new conceptions of general intelligence and aptitudes to understand the differences in learning based on the new forms of instruction. (21 ref.) *J. L. Loeck*

5803. **Solomon, Leonard.** **Innovazioni nei metodi di insegnamento delle scienze sociali e di comportamento.** *Unpublished* in teaching methods in the social and behavioral sciences. *Il Risveglio in Italia*, 1968, No. 58, 40-52. (1) Explores the T-group approach. (2) Explores the T-group as a new group training method in sociology and psychology. The T-group is a nonstructured group of 10-15 persons. The purpose of the group is the question of the means to achieve an authentic communication, which is possible by means of a deep understanding of one's self and of others. The T-group can be considered a micro-society with person-to-person communication. One can resolve conflicts concerning the interpersonal influences, one's understanding in communication, and one's attitude toward group authority. The T-group is organized as a course offered in universities, modeled by a sociologist or a psychologist. Each T-group member goes through a

phases of development: (a) the problem of truly belonging to the group, (b) the problem of leadership and influence, and (c) the problem of spontaneity and expression. "What seems necessary in the light of these teaching methods is the transformation of the classroom into a stage where the students are the actors, the teacher initially acts as director," but the presentation follows the lines of the modern theatre of art.—A. M. Farfaglia.

5804. Spielberg, Charles D. The effects of anxiety on computer-assisted learning. *CAI Center Technical Report, Florida State U., 1970(Jun), No. 7, 47 p.*—Examines the nature of anxiety in historical perspective, and discusses the concept of trait and state anxiety. Methods for measuring these constructs are described. Hypotheses about the effects of anxiety on learning were formulated in terms of Spence-Taylor drive theory and Spielberg's trait-state anxiety theory. 2 experiments with undergraduates tested the effects of anxiety on computer-assisted learning. It was found that state anxiety was a better predictor of performance than trait anxiety, and that performance was an interactive function of anxiety state and task difficulty. Some important implications for the classroom teacher of research on anxiety and learning are discussed. (34 ref.)—*Journal abstract.*

5805. Spielberg, Charles D., O'Neil, Harold F., & Hansen, Duncan N. Anxiety, drive theory, and computer-assisted learning. *CAI Center Technical Report, Florida State U., 1970(Sep), No. 14, 67 p.*—Investigated the effects of anxiety on computer-assisted learning. 4 studies with 7th grade and undergraduate males and females are reported. Ss were tested with the State-Trait Anxiety Inventory before and after being presented with science and mathematics materials by an IBM 1500 CAI system or in a laboratory setting. Results are discussed in terms of their implications for trait-state anxiety theory and drive theory. Findings support trait-state anxiety theory in affirming the importance of the conceptual distinction between anxiety trait and anxiety state, and in the prediction that high anxiety trait Ss will show greater elevations in anxiety state than low anxiety trait Ss in a learning situation in which the S's personal adequacy is evaluated, or which pose a threat to self-esteem. Findings also support the drive theory, although sex differences were noted which need further evaluation. (39 ref.)—*Journal abstract.*

5806. Spollen, Joseph C. (Fordham U.) The effect of individualization of instruction on cognitive and perceptual functioning of kindergarten children with a developmental lag. *Dissertation Abstracts International, 1971(Jan), Vol. 31(7-A), 3355.*

5807. Sporborg, Anthony. (New York U.) An experimental study of the effect of programmed productive thinking materials on the divergent and convergent test scores of sixth grade students in a suburban school system. *Dissertation Abstracts International, 1971(Jan), Vol. 31(7-A), 3355.*

5808. Thomas, David B. Two applications of simulation in the educational environment. *CAI Center Technical Memorandum, Florida State U., 1971(Feb), No. 31, 27 p.*—Discusses 2 simulations which provide a laboratory-like means for student involvement with complex quantitative models in the context of an individualized learning environment. STATSIM, exercises in statistics, permits the student to explore simulated representations of descriptive and inferential

statistics relating to sampling distributions, the concepts of Type I and Type II errors, and the sequential nature of hypothesis testing. The simulation of mathematical learning models provides a student laboratory for investigation of associative learning. An experiment using 23 graduate students investigated student control of instructional sequence with simulations employed as learning materials. Results suggest that naive students may show increased performance when permitted learner control over instructional sequence. (18 ref.)—*Journal abstract.*

5809. Torrance, E. Paul. (U. Georgia) Small group behavior of 5-year-old children under three kinds of educational stimulation. *Journal of Experimental Education, 1970(Sum), Vol. 38(4), 79-82.*—Investigated differential effects on the small group behavior among 5-yr-old children of 3 alternative approaches to educational stimulation. Ss were 48 children in a "traditional kindergarten approach," 48 children under the "creative-aesthetic approach," and 96 children under the "cognitive-structured approach." Ss were assigned to 4-person groups to function in teams to match correctly 12 sets of twin faces on plaques. The E oriented entire classes (15-25 Ss each) to the concept of team behavior and an O was assigned to each 4-person group. There were no statistically significant differences among the 3 sets of groups on amount of time required to complete the task. The behavior of the "traditional kindergarten" groups could be characterized as alert, cooperative, enthusiastic, organized, and friendly. That of the "creative-aesthetic" Ss could be described as bickering, fighting, absorbed, and enthusiastic. That of the "cognitive-structured" could be characterized as somewhat apathetic, inattentive, low in friendliness, and lacking in organization.—*Journal abstract.*

5810. Torrey, Jane W. & Silverman, Linda. (Connecticut Coll.) Teaching standard English grammatical morphemes to speakers of another dialect. *Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6(Pt. 2), 531-532.*—The grammar of nonstandard Negro English permits omission of certain grammatical morphemes that are required in standard English. Previous research had shown that Negro 2nd graders increased their use and understanding of the possessive "is" ending and the contracted "is" but not of the singular verb "s" after drills that gave practice with each morpheme separately without reference to other grammatical knowledge. In the present experiment (N = 24 2nd graders in a special summer program for children who needed extra schoolwork) the verb inflection was taught through a program that built upon the speakers' existing knowledge of tense inflections and the "is-are" distinction. Prompted verbal responding, writing, and understanding of the singular inflection were improved.—*Author abstract.*

5811. Wasik, Barbara H. & Simmons, Joyce T. (North Carolina, Chapel Hill) Management of small group behavior within a first grade classroom. *Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6(Pt. 2), 667-668.*—Management procedures were successfully employed to decrease the frequency with which 1st graders were leaving small work groups. Each group of 5-6 Ss were leaving small work groups. Each group of 5-6 Ss rotated daily through 5 activity times. During a modification condition, a special activity time was introduced

If no member of a group had left the group setting during the day that group had access to the entire activity time. The frequency of leaving the centers quickly decreased during the modification condition, increased during Base-Line II, decreased during Modification II. During the modification conditions appropriate behaviors within the groups increased and teacher time spent in managing behavior decreased. *Author abstract.*

5812. Zahorik, John A. (U. Wisconsin, Milwaukee) **Teacher verbal feedback and content development.** *Journal of Educational Research*, 1970(May), Vol. 63(9), 419-423. Examined the use of 16 types of feedback during the medial and terminal phases of ventures in general and in relation to 4 types of ventures: 8 3rd and 7 6th grade teachers taught 1 current events discussion lesson based on the same content for each grade level. Analysis of tape recordings indicate that teacher verbal feedback is not independent of phase and type of venture. Significant differences were found between the types of feedback used during the medial and the terminal phase. Significant differences were also found in relation to both medial and terminal feedback among the 4 types of ventures. The value of these feedback behaviors is considered.—*Journal abstract.*

PERSONNEL & INDUSTRIAL PSYCHOLOGY

5813. Askren, William B. & Newton, Richard R. **Review and analysis of Personnel Subsystem Test and Evaluation literature.** *USAF AFHRL Technical Report*, 1969(Jan), No. 68-7, 382 p. Reviews and analyzes 95 documents related to Personnel Subsystem test and evaluation. Reports are divided into 2 groups: system tests and related research material. Each report is abstracted and then analyzed further in terms of 11 categories: (a) scope and relation to personnel subsystem elements, (b) test objectives, (c) data requirements and test criteria, (d) data collection methodology, (e) support requirements, (f) reducing and analyzing data, (g) significant test results, (h) communicating and using test results, (i) factors in planning a test program, (j) factors in conducting a test program, and (k) other problems (95 ref.).—*USAF AFHRL.*

5814. Avelsen, Thorbjørn. (U. Oslo, Inst of Psychology, Norway) **Psykologisk arbeid og forskning innen bedriften: Uktast til en kritisk vurdering.** [Psychological work and research in production plants: Draft for a critical discussion.] *Nordisk Psykologi*, 1969, Vol. 21(5), 320-334.—Presents an outline for a critical discussion of psychological work and research in production plants. It is considered important that such an analysis must be carried out on a level embracing the entire social system and the functions of the psychologist. Such an analysis will expose possible dysfunctions connected with the role of the psychologist. To carry out the analysis, the author has drawn on 2 sources: (a) other analyses of the functions of psychologists are noted and (b) some psychological findings are transformed to a more concrete language illustrating other possible dysfunctions in such a setting. The analysis shows that the role of the psychologist in the production plant may involve troublesome aspects. Since few psychologists in Norway currently work in this field, there will still be

opportunities for discussing and influencing the development of this kind of profession. It is concluded that psychologists in the production plants, as well as most other psychologists, may be much better off by wanting to do such system analyses themselves.—*English summary.*

5815. Gitter, A. George & Altavella, Julie. (Boston, U.) **Components of selected occupational statuses.** *CRC Report*, Boston U., 1969(Apr), No. 40, 82 p.

5816. Gitter, A. George & Baron, Norman. (Boston U.) **Gilding: Perception of occupational statuses.** *CRC Report*, Boston U., 1969(May), No. 38, 41 p.

Explored 1 aspect of "gilding" (communicative behavior intended by the communicator to falsify what he actually believes to be true). Ss were 95 white female undergraduates. A 3 x 29 correlated matrices design investigated the effects of ethnicity of occupational status incumbent and nature of occupation on gilding ascribed to the various incumbents. Significant differences were found among (a) the 29 occupations, the supervisory and nonsupervisory levels of occupations, and (c) white Anglo-Saxon Protestants as compared with Jewish and black incumbents (18 ref.).—*Journal abstract.*

5817. Hodos, Tibor. (National Inst of Labor Hygiene) **A munka- és muszáki pszichológiai kutatások módszertani fejlődésének néhány kérdéséről.** [Developments in the methodology of industrial and technical psychology in the Soviet Union.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 285-291.

Presents 2 characteristic problems of Soviet industrial and technical psychology with respect to methodological development. Soviet methods employed in the study of mental fatigue are considered. EEG, EMG, and GSR being the most effective. The central problem of technical psychology concerns the reliability of the human operator of modern control systems. While discussing various approaches attempted by different researchers, 1 of the most important theoretical and methodological principles of Soviet industrial psychology is stressed: the study of man who is the subject of cognition work and communication. (Russian summary) (4 p. ref.).—*English summary.*

chology in "Psychological Abstracts," 1927-1969. *Journal of Psychology*, 1971(May), Vol. 78(1), 125-137.—Investigated productivity in industrial psychology as indicated in *Psychological Abstracts* from the time of its inception in 1927 until 1970. The findings may be summarized as follows: (a) There has been a large increase in the number of articles reported over the years. (b) There are peak and lean years. (c) Productivity considered in terms of output/person has generally gone down with increase in membership in Division 14. (d) The skewed distribution for industrial psychology resembles the skew found in other areas of psychology. (e) The productivity and status of psychology compares relatively favorably with that of other sciences whose research output has been studied. (21 ref.)—*Author abstract*.

5822. Smith, Robert G. (HumRRO, Alexandria, Va.) A manpower delivery system: Implications for curriculum development. *HumRRO Professional Paper*, 1970(Jun), No. 19-70, 6 p.—Presents a simplified and abstract model of a manpower delivery system. The relationships among the functions of occupational demands, guidance activities, placement work, occupational barriers, and interests of the job-seeker are discussed. The model points out to educational and training planners the principal aspects to consider when conducting a system analysis for vocational or professional education.—*HumRRO*.

5823. Strub, Michael H. Perception of military event patterns in a two-alternative prediction task. *U.S. Army BESRL Technical Research Note*, 1970(Feb), No. 221, 20 p.—In a study of perception of military event patterns, research effort was focused on the recognition of complex cues to enemy action. An attempt was made to determine the role of (a) different forms of 2nd-order patterns, (b) 2nd-order strength, (c) continuity, and (d) experience as factors in the recognition of 2nd-order patterns. 48 enlisted men participating in 2 experimental sessions, each consisting of 5 100-trial periods with 10-min interval breaks, indicated which of 2 enemy activities, attack or rest, was likely to follow each of 2 previous events. Each man worked individually, was self-paced, and also responded to indicate confidence in his decisions. Findings showed that given a pattern of events occurring with high frequency (80% of the time) and sufficient experiences with the patterns, the decision-maker learned to predict the 3rd sequential event as often as it occurred. When pattern occurrence was less frequent (68% of the time), recognition did not occur. Confidence in predicted decisions was affected by increase in experience and pattern form, but not by pattern strength or continuity.—*A. J. Drucker*.

VOCATIONAL CHOICE & GUIDANCE

5824. Čáp, Jan. (Charles U., Prague, Czechoslovakia) Pedagogickopsychologická hlediska v profesniografických metodách. [Educational psychology

concern with regard to methods of occupational psychology.] *Psychologie v Ekonomické Praxi*, 1970, No. 4, 191-209. Discusses educational psychology with regard to the methods of occupation selection. The need for investigating occupational psychology premises and their outer (psychology of experience) as well as inner (psychology of conduct) aspects is emphasized. In gathering occupational data, the results of the following are analyzed: (a) man-man, (b) man-working tool, and (c) man-environment interactions during the apprenticeship and occupation in biological as well as social connections. The critical points of the occupation (e.g., stress, difficulties) and their relations to the genesis of psychological premises are discussed. (English, German, & Russian summaries) (38 ref.)—*M. Lescinsky*.

5825. Csirzka, János. Foglalkozásismeret az egyéni fogalomkincs tükrében. [Students' knowledge about the vocation they want to choose as reflected in their individual vocabulary.] *Pszichológiai Tanulmányok*, 1968, No. 11, 393-407.—Describes an inquiry into the ideas about occupations as conceptualized by 150 pupils about to graduate from Budapest secondary schools. It was found that both boys and girls had more or less adequate ideas about the most popular occupations, e.g., physician, teacher, engineer, electrician, motor mechanic, precision mechanic, and hairdresser. Any kind of critical approach, however, was lacking—drawbacks of the occupations in question were only minimally considered. Ss ideas of occupations are 1-sidedly materialistic; concepts involving the personal traits of the candidate, pleasure in achievement, professional ideals, and working morale are rare. Differences between Ss in this respect are considerable. It is suggested that vocational guidance should include preparatory instructions dealing with the issues involved. (Russian summary)—*English summary*.

5826. Hawley, Peggy. (San Diego State Coll.) What women think men think: Does it affect their career choice? *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 193-199.—Attempted to find an empirical data-base appropriate to women's careers. It was hypothesized that men's views play an important although often unrecognized part in the careers women choose. Women may be influenced by what they believe men think is appropriate female behavior. This supposition was supported by 2 findings in a study of 86 women: (a) women's perceptions of male views of the feminine ideal differed significantly depending upon the career group in which they belonged, and (b) their perceptions differed according to whether or not they were married. Women in traditionally feminine occupations tended to think men view behavior in a sex-linked way, as appropriately male or female. Women outside the feminine career group did not perceive men making sex the basis for the behaviors described. (18 ref.)—*Journal abstract*.

5827. Johansson, Charles B. & Rossmann, Jack E. (Macalester Coll.) Interest patterns among economists. *Journal of Counseling Psychology*, 1971(May), Vol. 18(3), 255-261.—Compared the vocational interest patterns of 99 PhD male economists on the SVIB with data from 91 non-PhD economists and 4 other groups of PhD behavioral scientists. The interests of PhD economists most closely resembled those of psychologists and to a lesser extent those of political scientists, sociologists, and anthropologists. An economists' scale was developed for the SVIB and 105 male occupations were scored on the

scale—the highest scoring groups were the behavioral scientists and the lowest included policemen, salesmen, and farmers. Contrasting PhD and non-PhD economists indicates that the non-PhDs had similar interests, but they were not as strongly committed to those interests as the PhDs.—*Journal abstract.*

5828. **Kostolanský, Rudolf.** (Komenský's U., Inst. for the Psychology of Professional Development, Bratislava, Czechoslovakia) **Posudzovanie vhodnosti pre povolanie psychologickými testami.** [Judging the suitability of professions through psychological tests.] *Jednotná Škola*, 1969(Dec), Vol. 21(10), 913-925. -Proposes that psychological tests be used to help the individual decide what professions are available to him and which he should enter. In estimating the suitability of a profession, social and psychological data are considered necessary. The level, possibilities, and aims of the social background are important factors in the selection of a profession. Psychological data are intended to help the advisor to determine the educational level the client is able to reach, what special aptitudes are needed for the successful exercise of a preferred profession, and what group of people in professional life the client resembles. Several categories of useful tests are distinguished: intelligence, special aptitude, performance, interest, and personality tests. The limitations of the tests and the need for tact and prudence in advising the client of results are discussed. (Russian summary)—*English summary.*

5829. **Maxon, Lloyd M.** (North Texas State U.) **The relationship of certain mental factors, reading factors, aptitudes, and situational factors to achievement in selected Air Force technical courses.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3437.

5830. **Rókuszalvy, Pál.** (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Kérdőívek alkalmazása a munkamagatartás és a személyiségvonások értékelésére.** [Use of questionnaires for evaluating work-attitude and personality traits.] *Pszichológiai Tanulmányok*, 1968, No. 11, 357-376. Aims at increasing the diagnostic value of evaluative questionnaires, and refining research methods directed at revealing vocational effectiveness. Although objective criteria of vocational effectiveness (output of products, proportion of rejects, casualties, etc.) are of basic importance in establishing the prognostic value of a vocational test system, they do not furnish information on the personal constituents of vocational effectiveness. Therefore, a new evaluative questionnaire has been drawn up based on the recommendations of H. Dirks, W.M. O'Neil and W. Tschanz, to report on the personality of the testee. It is a situational, specific, multiple choice method. 1st, Ss were evaluated from 1 definite viewpoint. Then by referring to the normal distribution, the examiners were able to avoid giving an average. Evaluation is based on parameters gained from ability tests for the requirements of the vocation chosen. Evaluative criteria including the parameters are graded along a 5-point scale, and each category in the scale is situationally defined. These situational value categories are exposed in random order. In the final section of the questionnaire, complementary questions eliciting data for free characterization are included. Independent reports on every S are asked from 2 of his superiors. Up to now 3 versions of the questionnaire have been elaborated and employed to test (a) female assemblers in

precision mechanics, (b) railway personnel, and (c) apprentices in the clipping trade. Experience has shown that the questionnaire is of considerable value in (a) improving test systems for vocational fitness, (b) training apprentices and increasing their vocational effectiveness, and (c) follow-up service of vocational guidance. (Russian summary)—*English summary.*

SELECTION & PLACEMENT

5831. **Bale, Ronald M. & Waldeisen, Lewis E.** (U.S. Naval Aerospace Medical Inst., Pensacola, Fla.) **The relationship of the Objectively Scoreable Apperception Test (OAT) to success in naval aviation training.** *USN AMI*, 1969(Jun), No. 1076, 6 p.—The Objectively Scoreable Apperception Test (OAT) was administered to 725 naval aviation officer candidates during their 1st wk. of training to examine the potential of the OAT as a supplement to the primary selection system. Multiple correlations were first determined by using only the scores from existing primary selection variables: the criterion was completion vs. separation from flight training. With a 2nd set of multiple correlations the dimension scores of the OAT combined with those of the primary selection variables were used. Results of the experimental analysis revealed that inclusion of the OAT scores significantly augmented the multiple correlation; however, under cross-validation the inclusion of those scores did not result in a significant increase in predictive validity. It is concluded that, although the OAT as it presently exists is not suitable for inclusion in the Pensacola student prediction system, the evidence obtained with the experimental sample indicates the feasibility of developing a similar device geared specifically toward a naval aviation population. *USN AMI*.

5832. **Einhorn, Hillel J. & Bass, Alan R.** (U. Chicago, Graduate School of Business) **Methodological considerations relevant to discrimination in employment testing.** *Psychological Bulletin*, 1970(Apr), Vol. 75(4), 261-269. Test discrimination can be defined as an over- or underprediction of criterion scores for different subgroups of job applicants. It is shown in the present study that differences between subgroups with respect to test-criterion correlations, criterion means and variances, and differences in standard errors of estimate must be taken into account to avoid unfair discrimination. Utility assumptions, which play an important part in any selection strategy, are considered with respect to test discrimination. A method is developed which utilizes all the relevant information concerning differences between groups to arrive at a nondiscriminatory procedure for selection (15 ref.) *Journal abstract.*

5833. **Evans, John T.** **Preliminary report on a test of mechanical comprehension.** *USN AMI*, 1970(Mar), No. 1103, 4 p.—Describes a display board with 4 knobs, variably geared on the back. The postulated task involves a perceptual recognition of the direction and degree of rotation of the 3 knobs as 1 of them is turned. After this determination is made a projection then must be made to the gearing that must be present on the back of the board to explain the direction and degree of rotation as perceived. Solutions to the problems were recorded either on an answer sheet or by laying blank gears in the desired configuration on the desk. 3 phases successively controlled time of observation and amount of rotation allowed.—*USN AMI.*

5834. Froehlich, Dean K. (HumRRO, Alexandria, Va.) **Military advisors and counterparts in Korea: II. A study of personal traits and role behaviors.** *HumRRO Technical Report*, 1970(Sep), No. 70-13, 89 p.—To develop successful selection procedures, training materials, and management policies for Military Assistance Program advisors, the conditions under which they work were analyzed, including identifying the culturally determined preferences counterparts have for the people with whom they wish to work, and the extent to which advisors and counterparts satisfy what each regards as critical role behaviors of the other. United States Army advisory personnel assigned to the United States Army Advisory Group, Korea and counterparts in the Republic of Korea Army were surveyed. Through rating scales and questionnaires, observations were made of the kinds of personalities with whom advisors and counterparts most preferred to work. In addition, advisors and counterparts judged one another in terms of a large number of role behaviors previously identified as important.—*HumRRO*.

5835. Gregg, George. **The effect of maturation and educational experience on Air Force Officer Qualifying Test scores.** *USAF AFHRL Technical Report*, 1968(Jul), No. 68-107, 12 p.—It is known that maturation and education have an elevating effect on Air Force Officer Qualifying Test (AFOQT) scores. Since the AFOQT is administered at different educational levels for the several commissioning programs, differences which are largely spurious exist between the programs with respect to their score distributions. To evaluate the extent of differences produced by maturation and education, the AFOQT was administered experimentally to 415 AFROTC cadets in 32 institutions near the end of their senior yr. Scores were compared with those obtained for the same group when they were tested as freshmen or sophomores for selection by the AFROTC program. For the experimental group as a whole, the Officer Quality score showed an increase of approximately 30 percentile points over the national mean for AFROTC applicants. The increase was greatest for cadets in rated categories (IP and IN) and in the scientific-technical category (II). Because of statistical artifacts, the increase was greater for those whose initial scores were low than for those whose initial scores were high. The increase in Pilot scores for the total group was about 20 percentile points, with the greatest increase (30-50 points) occurring in the categories which received light plane training as part of the AFROTC curriculum. The increase in Navigator/Technical scores amounted to about 6 points for the total group, but it approached 30 points for Category II cadets whose initial scores were below the 75th percentile. Category II cadets had initial scores about 30 points higher than cadets in nonscientific programs (Category III), and this difference persisted in the final testing. Data supported the additional finding that the known stable rank-ordering of institutions with respect to AFOQT scores of freshmen and sophomores applies also to AFOQT scores of seniors. The data also permitted determination of test-retest reliabilities and intercorrelations of AFOQT scores.—*USAF AFHRL*.

5836. Nash, Allan N. (U. Maryland) **Modification of forced-choice format for use in personnel selection and appraisal.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 108-110.—Discusses implications of a "mixed triad" format for forced-choice scales on the acceptability and validity of such scales in selection and

appraisal instruments. Results of a pilot study ($N = 15$) which is interpreted as supporting the use of the suggested format for such instruments are presented.—*Journal abstract*.

5837. Perczel, J. & Perczel, T. **Description and measurement of personality traits by a projective technique and an auto-definition questionnaire with production engineering inspectors.** *British Journal of Projective Psychology & Personality Study*, 1969(Jun), Vol. 14(1), 27-29.—Describes 2 tests as being predictive of occupational suitability in 2 groups of production engineering inspectors. The Lavoegie self-characterization test predicted suitability in a group of 39 inspectors. The Rosenzweig Picture-Frustration Study predicted success on the job in a group of 43 inspectors. A combined grading system, using both tests, was used with a group of 30 inspectors. (15 ref.)—*B. Beulahmami*.

5838. Schircks, A. & Laroche, J. L. (Inst. National pour la Formation des Adultes, Nancy, France) **Etude des opérations intellectuelles chez des adultes de la promotion supérieure du travail.** [Study of mental operations in adults working toward technical promotions.] *Travail Humain*, 1970(Jan), Vol. 33(1-2), 99-112.—Ss were adults (average age, 23 yr.) with only elementary education, who were striving for higher positions. They were given reasoning tests based on Piaget's theory and clinical methods. There was a large spread of scores, and it is suggested that training goals should be set on the basis of these test findings.—*R. W. Husband*.

5839. Šlédř, Jiří. (Charles U., Psychological Div. Prague, Czechoslovakia) **Koncepcie psychologického výběru pracovníků.** [System of psychological employee selection.] *Psychologie v Ekonomické Praxi*, 1970, No. 4, 218-224.—Discusses factors affecting the labor productivity and harmony between the occupation demands of a job and personal occupation premises of employees. The general principles and the procedure of employee selection are described. Psychologists (a) inform the firm representative about the possibilities of psychological selection and agree on the requirements of the selection and (b) find the mental aspects of the employee and on that basis determine the method of selection. Selection is carried out on: (a) general intelligence, (b) special ability, and (c) personal ability levels. The unreliability of the short-term investigation is to be reduced by: (a) the tests carried out individually as well as in groups at different times, (b) the test which enables results to be checked, (c) the order of the examinations, and (d) the results which are compared with available data. The psychologist's responsibility in employees' selection is conceived of as his responsibility to society and to the individual (English, German, & Russian summaries) *M. Lescinsky*.

5840. Walker, Elaine & Markham, S. J. (Sydney Technical Coll., New South Wales, Australia) **Computer programming aptitude tests.** *Australian Psychologist*, 1970(Mar), Vol. 5(1), 52-58.—Investigated the International Business Machines' Revised Programmer Aptitude Test (RPAT) and the International Computers and Tabulators Computer Programming Aptitude Test (ICT) in relation to the selection of students for computer programming courses. 86 applicants were administered the RPAT and the Otis Quick-Scoring Mental Ability Tests, Higher Form B; 297 applicants were administered the RPAT and the ICT. Means and

standard deviations of various tests and product-moment correlations between various test scores and high school certificate examinations were computed. It is concluded that (a) Australian norms appeared necessary since the Australian applicants for computer jobs differed considerably from the American population, and (b) neither the RPAT nor the ICT correlated highly; consequently no differential selection of applicants were possible with 1 test as compared to the other.—H. Roemmich.

5841. Walker, James W. (Indiana U.) **Forecasting manpower needs.** *Harvard Business Review*, 1969(Mar), Vol. 47(2), 152-164.—Describes the initial steps toward improved models for manpower planning. Sound theory and careful research are needed to develop forecasting techniques which managers can use in planning personnel strategies.—C. F. Youngberg.

5842. Want, R. L. **The history of psychology in the Royal Australian Air Force.** *Australian Psychologist*, 1970(Mar), Vol. 5(1), 2-8.—Describes the introduction and utilization of psychological testing in screening for training and selection for promotion in the Royal Australian Air Force. The results are described as positive and both training and promotional procedures have been improved.—H. Roemmich.

TRAINING

5843. Ammerman, Harry L. (HumRRO Div. No. 5, Fort Bliss, Tex.) **Systematic approaches for identifying and organizing content for training programs.** *HumRRO Professional Paper*, 1970(Jun), No. 20-70, 15 p.—Discusses 2 aspects in the development of curriculums for technical training: (a) the identification of curriculum content for specific courses of study, and (b) the organization of such content in training programs. Use of a word-association technique in a military radar maintenance course revealed that many procedural questions need exploring before this approach can become an operational tool of curriculum designers. Effort being expended in making instructional decisions should be directed toward more complete determination of the performance requirements.—HumRRO.

5844. Berry, Gene A., Prather, Dirk C., & Jones, Gerald L. (U.S. Air Force Academy, Colorado Springs, Colo.) **The effect of prompting and feedback on the learning of a perceptual skill.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 589-590.—40 Air Force cadets were randomly assigned to 2 groups and were trained on a range estimation task. 1 of the groups was trained by a trial-and-error method involving feedback only. The other group was trained by a combination of 3 heavily prompted trials and 6 trial-and-error trials. After the 4th and 5th training trial the trial-and-error Ss' performance was superior ($p's < .1$ and $< .05$). Following training each group was compared on performance under the conditions of transfer and stress. On transfer the difference in performance favored the trial-and-error Ss ($p < .1$), but the stressful condition produced no significant differences. *Author abstract*

5845. Caro, Paul W. (HumRRO, Ft. Rucker, Ala.) **Equipment-device task commonality analysis and transfer of training.** *HumRRO Technical Report*, 1970(Jun), No. 70-7, 30 p.—Developed procedures to enable training personnel systematically and objectively to determine the potential utility of training devices for teaching how to perform missions in operational equip-

ment. The procedures allow comparison of operational task stimulus and response elements with corresponding elements in synthetic training equipment. On the basis of such information, training programs consistent with the psychological principles underlying transfer of training may be developed. The procedures may be applied to the potential use of training equipment in a training situation other than that for which it was designed, or in determining the applicability of "off-the-shelf" training devices to specific training requirements. The procedures, termed Task Commonality Analysis, were developed in connection with an Army rotary wing instrument flight training program. In an application of the procedures in that program, transfer of training predictions were generally consistent with empirical evidence collected earlier.—HumRRO

5846. Crawford, Meredith P., et al. (HumRRO, Alexandria, Va.) **HumRRO research in training technology.** *HumRRO Professional Paper*, 1970(Jun), No. 21-70, 35 p.—Records 4 presentations on research and development in educational technology made by members of the HumRRO staff. The presentations describe research under Work Unit IMPACT, Prototypes of Computerized Training for Army Personnel; research activities on individual training with low aptitude personnel under Project 100,000; and research in aviation training and aviation training devices.—HumRRO

5847. Faconti, Victor; Mortimer, Charles P., & Simpson, Duncan W. **Automated instruction and performance monitoring in flight simulator training.** *USAF AFHRL Technical Report*, 1970(Feb), No. 69-29, 365 p.—Documents research in the area of automated instruction and performance monitoring conducted to develop modular approaches to implementing 8 individual automated training capabilities in flight simulators. Several approaches to each area were identified and investigated. 2 integrated systems were designed. Selection of the components for each of the systems was made by assigning levels of relative complexity to each approach in each area. System 1 was designed by using the lowest complexity approach in each area while System 2 consisted of the highest. Several methods of implementation, in relation to the computer complex, are presented. Estimated implementation costs are given for the 2 systems for each selected computer configuration and 2 display system options (System 2). (18 ref.) *USAF AFHRL*

5848. Gebhard, Richard M. (HumRRO, Alexandria, Va.) **Development of a training program and job aids for maintenance of electronic communication equipment.** *HumRRO Technical Report*, 1970(Dec), No. 70-19, 71 p.—Developed the JOBTRAIN IV to produce a combination of training and manuals (job aids) that would require less training time than the standard course for the 294.1 Carrier Equipment Repairman. The methods developed were those of an equipment malfunction analysis for producing content for special manuals and methods of course construction which introduced theory as the student needed it to solve practical maintenance problems. 22 students graduating from an 11-wk JOBTRAIN course were tested on the same job performance test as 19 graduates of the 28-wk standard course. Ss from the 2 groups were matched and each was individually tested for 22 hr during a 6-day period. There were no statistically significant differences in performance. It is concluded that the combination of JOBTRAIN training and job aids is as effective as

conventional school training and manuals and that a 50% reduction in academic hours can be achieved by this combination.—*HumRRO*.

An attempt at shaping a model for evaluating by quantity: I.] *MPI B-Rapport*, 1969(Oct), No. 35, 51 p.—Considers that psychological effects in combat are due to the troop's morale. An attempt is made to replace the concept of morale by measurable auxiliary concepts. The theoretical background is described of investigations aiming to predict likely performance in the field on the basis of the troop's performance in military training in peacetime. (Swedish summary) (23 ref.)—*English summary*.

5850. Matheny, W. G. & Wilkerson, L. E. (Life Sciences, Inc., Ft. Worth, Tex.) *Functional requirements for ground-based trainers: Helicopter response characteristics.* *HumRRO Technical Report*, 1970(Oct), No. 70-17, 108 p.—Studied helicopter response characteristics using 44 experienced helicopter pilots. Analyses were made of (a) characteristics of each dimension of control, (b) interaction among the dimensions, (c) effect of external forcing functions, and (d) information the pilot receives by kinesthetic feedback from the controls. A measure of man-machine system characteristics was postulated—the "effective-time constant," the time it takes for the displayed output of the system to rise above the pilot's threshold of perception. Dealing with the effects of interaction among the controls proved to be 1 of the most difficult pilot tasks; of the single dimensions, pitch control is the most difficult. The characteristics of the system were identified for quantitative variation in research on task difficulty and transfer of training. (38 ref.)—*HumRRO*.

5851. McClelland, William A., et al. (HumRRO, Alexandria, Va.) *HumRRO research on officer training.* *HumRRO Professional Paper*, 1970(Sep), No. 24-70, 40 p.—Records 4 presentations on officer training and education research programs made by members of the HumRRO staff. The presentations provide information about selected HumRRO research projects, summarizing the work, describing progress to date, and giving a forecast of future demands to be placed on military leaders and advisors. (25 ref.)—*HumRRO*.

5852. McHugh, William T. (U. Oregon) *A study of the differences in self-concept and occupational role concepts of young women and middle-aged women in occupational training programs.* *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 3273.

5853. Mullins, Cecil J. & Usdin, Eugene. (Southwestern Computing Service, Tulsa, Okla.) *Estimation of validity in the absence of a criterion.* *USAF AFHRL Technical Report*, 1970(Oct), No. 70-36, 23 p.—In a training situation, standard procedures to predict performance entail a long delay between the request for a prediction instrument and its delivery. In this study, methods were developed for constructing prediction instruments at the time of request, rather than requiring the necessary time elapse for maturation of criterion data. The prediction systems developed by these methods were about as effective as instruments developed by the classical methods. The synthetic methods utilized estimates of performance made by experts in the training area as substitutes for actual performance. These

methods, therefore, can be used before a course has even been given for the 1st time. *USAF AFHRL*.

5854. Osborn, William C. *An approach to the development of synthetic performance tests for use in training evaluation.* *HumRRO Professional Paper*, 1970(Dec), No. 30-70, 6 p.—Describes an approach to the selection of inexpensive alternatives to fully job-relevant performance tests. Based on the concept of content validity, the approach is to utilize the skill and knowledge required of the trainee as a criterion for assessing the cost and job-relevance of fabricated alternatives to performance tests. 2 job tasks are analyzed to illustrate the concept.—*HumRRO*.

5855. Ozkaptan, Halim, et al. (U.S. Naval Personnel Research & Development Lab., Washington, D.C.) *Investigation of required television parameters for simulation of the pilot's visual world.* *NAVTRADEVCECEN Technical Report*, 1969(Dec), No. 68-C-0153-1, 137 p.—Describes a series of tests designed to investigate resolution and target recognition performance under conditions of direct viewing and TV mediated viewing of appropriate test stimuli. The study, using ex-military pilots as Ss, utilized resolution bar charts and simple target forms, varying in target-to-background contrast. It was found that under idealized viewing conditions the same visual relationships generally apply between direct and TV viewing. Under normal TV resolution limitations, an increase in target image size and/or contrast is required to permit visual resolution equivalent to that of direct viewing. It is concluded that the specific delineation of TV simulation requirements will be a function of target complexity, with TV resolution and video signal-to-noise ratio playing a different role as target complexity increases. (22 ref.)—*NAVTRADEVCECEN*.

5856. Schumacher, Robert A., Brand, Brigitta; Gilliland, Maurice G., & Sharp, Werner H. (General Electric Co., Apollo Systems, Daytona Beach, Fla.) *Study for applying computer-generated images to visual simulation.* *USAF AFHRL Technical Report*, 1969(Sep), No. 69-14, 131 p.—Describes the results of a system design study for applying digital image generation techniques to visual simulation for pilot training. Digitally generated scenes overcome many of the shortcomings associated with more conventional approaches but have had limited application because of the difficulty of computing enough image detail. The impact of recent developments in this area on the design of an image generating system is assessed. The conceptual design of an image generator is described. The principles of operation, the system configuration, operational characteristics, and feasible methods of implementation with presently available hardware are examined. An estimate of the hardware complexity is given.—*USAF AFHRL*.

5857. Sidorsky, Raymond C. & Simoneau, George R. (General Dynamics Corp., Electric Boat Div., Groton, Conn.) *Decision-making study final report: An Experimental Evaluation of TACTRAIN: An approach to computer-aided tactical decision-making training.* *NAVTRADEVCECEN Technical Report*, 1970(Jun), No. 1329-4, 93 p.—Presents summaries of 3 previous technical reports and the final report of a study of generalized decision making skills. The purpose of this project was to identify through both analytic and experimental means, the decision making skills required for effective performance in AAW and ASW tactical situations. The results of an experimental evaluation of a

new decision-making trainer, TACTRAIN, are presented. Results demonstrate the feasibility and utility of TACTRAIN as a developer of basic decision-making skills. The hardware and software of the prototype system are described. The system was assembled to demonstrate that a relatively small computer (4096 24-bit words) and a computer-controlled CRT display system are sufficient to provide a fairly complex training situation. Use of the device as an adjunct to computer-aided instruction in the usual instructor-controlled training situation is discussed. (22 ref.)—NAVTRADEVEN.

5858. Taylor, John E., Montague, Ernest K., & Hauke, Robert. (HumRRO, Presidio Monterey, Calif.) **The interrelationships of ability level, instructional system, and skill acquisition.** *HumRRO Professional Paper*, 1970(Dec), No. 29-70, 5 p.—Describes an assessment of the impact of aptitude differences on the learning performance of Army recruits. As a result of these tests, instructional strategies are being developed to make efficient training programs for men of differing aptitude levels. Observations were that the high level group (N = 180) did better when left without a structured training program; that the middle range (N = 190) was also able to work at its own speed. Low aptitude groups (N = 350), however, required a complete structured program in which the instructional sequence was kept down to small steps presented on an elementary language level.—HumRRO.

5859. Thompson, J. W. & Evans, W. W. (Michigan State U.) **Behavioral approach to industrial selling.** *Harvard Business Review*, 1969(Mar), Vol. 47(2), 137-151.—After the basic principles of selling were extracted from the literature of the behavioral sciences they were converted to a manual of marketing techniques. The sales force of Carborundum Company was divided into training groups and several hundred instructional cases were developed for small group discussions. Management, salesmen, and distributors were enthusiastic about the program.—C. F. Youngberg.

5860. Weber, R. Jack. (Dartmouth Coll.) **Effects of videotape feedback on task group behavior.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 499-500.—1 relatively unexplored approach to group development which avoids the encapsulation of training implicit in residential laboratory education involves the periodic provision of videotape feedback to ongoing task groups of their own recent functioning. 56 students in a course in business administration served as Ss in a 3 x 5 repeated-measures factorial experiment with 3 levels of videotape feedback and 5 weekly meetings. A factor analysis of Bales' interaction process analysis scores showed that groups receiving videotape feedback experienced significant long-run increases in positive emotional behavior and decreases in negative emotional behavior, and significant short-run increases in questions and decreases in assertions compared to temporal changes in the control groups.—Author abstract.

5861. Wheaton, George R., Mirabella, Angelo, & Farina, Alfred. (American Inst. of Research, Silver Spring, Md.) **Trainee and instructor task quantification: Development of quantitative indices and a predictive methodology.** *NAVTRADEVEN*, 1971(Jan), No. 69-C-0278-1, 116 p.—An exploratory study was undertaken, as part of a program to develop quantitative techniques for prescribing the design and

use of training systems. As a 1st step in this program, the present study attempted to: (a) compile an initial set of quantitative indices, (b) determine whether these indices could be used to describe a sample of trainee tasks and differentiate among them, (c) develop a predictive methodology based upon the indices, and (d) assess that methodology using studies in the literature. The compilation included the display-evaluative index, a set of panel layout indices, and a set of task rating scales. These indices were applied to task analytic data, collected on sonar operator trainers. Application of the indices proved feasible, and differentiation among 3 training devices, and within 4 trainee subtasks (set-up, detection, localization, classification) was possible. The predictive method which was generated was an adaptation of the standard multiple regression model. Mean task scores replaced the usual individual criterion scores, and quantitative task index values were used as predictor scores. This adaptation was tested using data from published studies on tracking. Significant multiple correlations using task indices were found for criterion data obtained during early stages of practice. A combination of task and training indices did predict later performance. This result supported the contention that a prescriptive method must include "training" as well as "task indices" in order to account for advanced levels of proficiency.—NAVTRADEVEN.

TASK & WORK ANALYSIS

5862. Engel, John D. (HumRRO, Ft. Knox, Ky.) **An approach to standardizing human performance assessment.** *HumRRO Professional Paper*, 1970(Oct), No. 26-70, 9 p.—Presents an approach to standardizing performance assessment that concentrates on 2 critical areas and the relationship between them: (a) a task classification system; and (b) a performance measure, or criterion classification system. An example is presented that illustrates some preliminary research related to the use of a performance measure classification system, involving a 4-day proficiency test administered to 38 organizational mechanics.—HumRRO.

5863. Geréb, György. (Teacher Formative Coll., Szeged, Hungary) **Intenzív igénybevételt jelentő tevékenység és egyhangú cselekvés kölcsönhatásának pszichológiai vizsgálata.** [Psychological investigation of interaction between operations requiring intensive involvement and monotonous activities.] *Pszichológiai Tanulmányok*, 1968, No. 11, 335-355.—Performed experiments to determine how an operation requiring maximum concentration influences a monotonous activity following it, or to what extent monotonous activity affects degree of concentration, level of divided attention, and efficiency of manuality. Ss were given ball-sorting practice until bored with it. Achievement was mechanically recorded. The task requiring great concentration was partly the Düker-Lienert Concentration Achievement Test and partly the recorded information derived from a "stereometer." On the basis of arrhythmic programming, 5 disks were moved for 60 sec. According to the program, 1 or more disks would stop simultaneously, and the Ss were asked to release these disks again by pressing certain buttons placed in front of the disks. The amount of information the computer was able to produce and the rank order of the handling achievement was made. Achievement was greatest in the middle range and poorest at both extremes. Monotonous activity was

highly influenced by intensive concentration. Intensity of the preceding and succeeding activity weakens the monotony. (Russian summary) (46 ref.)—*English summary*.

5864. Hammerton, M. & Tickner, A. H. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **The effect of temporary obscuration of the target on a pursuit tracking task.** *Ergonomics*, 1970(Nov), Vol. 13(6), 723-725.—Describes an experiment with 8 groups of 6 Royal Naval ratings each, in which Ss performed a continuous tracking task with the moving target temporarily obscured during part of its course. It is concluded that (a) S's pursuit was very poor during the obscured interval; but (b) recovery of the target was very rapid thereafter. These conclusions held with both positional and velocity control systems. (French & German summaries)—*Journal abstract*

5865. Hammerton, M. & Tickner, A. H. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Structured and blank backgrounds in a pursuit tracking task.** *Ergonomics*, 1970(Nov), Vol. 13(6), 719-722.—Describes an experiment with 22 Naval ratings in which Ss moved a sighting device to keep a graticule on a moving target. Both realistic and blank backgrounds for the target were used; and S performances in the 2 conditions were compared. It was found that the blank and structured backgrounds were subjectively apprehended by Ss as providing entirely different types of control problem. Performance was inferior with a blank background, and it is suggested that training simulators for this type of control should always feature as realistic a background as possible. (French & German summaries)—*Journal abstract*.

5866. Kopstein, Felix F. (HumRRO, Alexandria, Va.) **Rational vs. empirical approaches to job/task description for COBOL programmers.** *HumRRO Professional Paper*, 1970(Jun), No. 18-70, 11 p.—Suggests the differences in the information to be gained from rational and empirical approaches to job/task analysis. Job analysis establishes what a representative sample of incumbents do on the job. Task/equipment analysis deduces the behavioral requirements for its operators and maintainers from the functional characteristics of equipment, or from task situations that do not yet exist in actuality. The empirical approach develops a set of behavioral capabilities together with associated frequencies of occurrence, but cannot guarantee that the required set of behavioral capabilities will be exhaustively enumerated. The rational approach will develop an exhaustive set of behavioral capabilities requisite for certain job or task constellations, but will provide no good way of establishing their probabilities of occurrence. Therefore, a combined approach seems desirable. This is illustrated in the context of a COBOL programmer's job. The uses of data from combined rational and empirical job/task analyses for statistical models of job families is discussed. The use of these models in training design is also discussed.—*HumRRO*.

5867. Maxey, Jeffery L. & Caviness, James A. (HumRRO Div. No. 4, Ft. Benning, Ga.) **Target detection in the field.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 583-584.—A factorial experiment was designed to determine if a negative exponential target detection model was adequate for describing the detection of moving human targets by stationary Os, and if the O's detection behavior was affected by (a) target

speed, (b) target-to-O range, and (c) the terrain in which the target appeared. 90 17 26 yr. old male enlisted men detected moving human targets. Analysis revealed that the negative exponential model did not adequately describe the Ss' detection behavior, but that target speed, target-to-O range, and the terrain in which the target appeared significantly affected the Ss' detection times.—*Author abstract*.

5868. McCormick, Ernest J., Jeanneret, P. R., & Mecham, Robert C. (Purdue U.) **Application of a structured job analysis procedure.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 501-502.—A structured job analysis questionnaire called the Position Analysis Questionnaire (PAQ) was used in 2 sets of factor analyses. 1 of these consisted of job data for a sample of 536 jobs, and the other of the rated attribute requirements of the 179 job elements. Experimental application of data based on the PAQ indicates that job requirements (expressed in terms of test scores) can be established by a synthetic job analysis procedure without conventional aptitude test validation procedures. Likewise, PAQ data are highly predictive of job values, thus, suggesting that conventional job evaluation systems might be eliminated.—*Author abstract*.

5869. Mead, Donald F. **Continuation study on development of a method for evaluating job difficulty.** *USAF AFHRL Technical Report*, 1970(Nov), No. 70-43, 12 p.—Describes the development of a multiple regression equation which satisfactorily predicted the difficulty level of 250 jobs from the Vehicle Maintenance Career Ladder. The correlation between the predicted values and the criterion values assigned the jobs by Air Force supervisors was .93. The research design was a replication of one used earlier with jobs from the Medical Materiel Career Ladder. The results obtained in this study support the major findings of the earlier investigation. The same basic predictor variables combined to form the most effective prediction equation in both investigations. The primary factors reflected in the job difficulty evaluation policy were number of tasks in the job description, difficulty level of tasks performed, and time spent performing the tasks. These findings provide support for the hypothesis that there are common factors which influence supervisors' judgments of job difficulty in all Air Force career ladders.—*ASAF AFHRL*.

5870. Mead, Donald F. **Development of an equation for evaluating job difficulty.** *USAF AFHRL Technical Report*, 1970(Nov), No. 70-42, 10 p.—This is the 1st in a series of studies designed to produce a method for evaluating the difficulty levels of Air Force enlisted jobs. In this particular study, 250 job descriptions in the Medical Materiel Career Ladder were ranked on difficulty by supervising personnel, using a complex partitioning system. Computation of interrater agreement for these rankings yielded an r of .93. 21 variables were defined which might have entered into the judgments made by supervisors, and regression analyses subsequently identified 3 variables which predicted the job difficulty rankings with an R of .95. These 3 predictor variables were Number of Tasks Performed, Difficulty of Tasks Performed per Unit Time, and Number of Tasks Performed, Squared. Application of a shrinkage correction formula to test for chance errors resulted in a negligible correction to the obtained R . Developing weights for the 3 predictor variables in

separate samples and cross-applying to predict the difficulty level of jobs in the opposite group yielded an R of .94 in both cross-applications. Comparisons of the rank-order positions of the criterion jobs using predicted and rated difficulty values revealed nonsignificant differences. Results indicate that the difficulty level of jobs within the Medical Materiel Career Ladder can be adequately determined using the derived 3-variable regression equation.—USAF AFHRL.

5871. Noël, W. K. A pilot study of the validity of ratings done on first-line supervisors. *Studies in Personnel Psychology*, 1970(Apr), Vol. 2(1), 48-61.—Test measures of the intellectual aptitude, personality, and interests of 30 French-speaking 1st-line supervisors were correlated to supervisor ratings on 12 factors including job knowledge, analytical ability, originality, judgment, risk-taking, administrative ability, communication, leadership, quality of work, quantity of work, general evaluation, and total score. 14 of 18 significant correlations were negative indicating that the relationship between test performance and rated performance is in the opposite direction from that usually found. Test validity, rating validity, and test-rating compatibility are discussed as explanations for the dissonance between test scores and ratings. (French abstract)—J. G. Tiedemann.

PERFORMANCE & JOB SATISFACTION

5872. Adam, Everett E. (Indiana U., Graduate School of Business) An experimental analysis of the change in performance quantity and quality on a routine, repetitive task. *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3097.

5873. Beatty, Richard W. (U. Colorado) First- and second-level supervision and the job performance of the hard-core unemployed. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 479-480.—This study of the relationship between certain supervisory qualities and the job performance of the hard-core unemployed found no significant correlations at the 2nd-level of supervision. The study indicated, however, that the immediate supervisor, when perceived as considerate, influenced performance positively and, when perceived as initiating structure to a high degree, influenced performance negatively. This negative relationship with structure appeared to be linear, but the relationship between consideration and performance was best described as curvilinear; for a majority of the trainees a positive relationship existed but at the extremes, for both high and low performers, the relationship was negative.—Author abstract.

5875. Hendrick, Hal W. (U.S. Air Force Academy, Colorado Springs, Colo.) A comparison of negative transfer of training effects for experienced and inexperienced subjects on a reversed polarity tracking task. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 591-592.—10 Air Force Academy cadets and 10 pilots with over 1000 hr. of single-engine jet flying time performed a realistic complex tracking task in the C-11 (F-80) jet trainer. The polarity of the control stick was then reversed and Ss again performed the tracking task.

Both groups of Ss had significantly larger heading and altitude errors under the reversed polarity condition, but the pilots' performance was grossly poorer.—Author abstract.

5876. Horváth, László G. (Inst. for Career Aptitudes, Budapest, Hungary) A személyiség és a szituáció szubjektív viszonya a munkapszichológiailag kutatások problematikájában. [The subjective relation between personality and situation in industrial psychology.] *Pszichológiai Tanulmányok*, 1970, Vol. 12, 223-233.—Work activity is considered to be the active behavior of a person whose main endeavor is to maintain the labor situation, to modify it, or to escape from it. The behavior of the worker depends on his attitude toward an active labor situation: normal or abnormal. In both the normal and abnormal situation, the worker may relate to his job adequately or inadequately. In the 1st case the worker has undertaken work he understands and is able to accomplish on an average level. If his performance is above average this will enhance his self-regard, self-respect, positive relations to his surroundings, and his assurance of belonging, of being part of society. A worker who undertakes a task he does not understand may relate inadequately to his work. This will affect his whole behavior, influence his relations with his coworkers, and diminish his self-regard. In an abnormal labor situation involving dangerous or heavy work calling for great physical or mental effort, it is still possible for the worker to react adequately or inadequately. Therefore special attention should be devoted to the psychological study of personality in order to assess why the worker has the experience of success or failure, and why the number of workers abandoning their jobs is increasing in the latter case. (Russian summary)—English summary.

5877. Jones, Ruel E. & Pederson, Darhl M. (Brigham Young U.) Human performance in a three-axis tracking problem using two distinct hand controller configurations. *Journal of Psychology*, 1971(May), Vol. 78(1), 31-37.—32 male, advanced Air Force ROTC cadet volunteers served as Ss. Ss were divided into 2 groups and then trained and tested on identical tasks using both controller configurations. Only the order of controller configuration used 1st differentiated the 2 groups. The task required the Ss to keep a simulated 3-axis artificial horizon in a straight, level, and on-heading condition while programed error signals were introduced. The dual controller configuration was found to be easier to use.—Journal summary.

5878. Kaufman, H. G. (Polytechnic Inst., Brooklyn, N.Y.) Effect of cognitive and motivational factors on the maintenance of professional competence among engineers. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 491-492.—This longitudinal study focused on the relative effects of cognitive and motivational factors, exhibited by engineers at the outset of their careers, on the maintenance of professional competence in their subsequent careers. Results indicate that initial cognitive level was the strongest single predictor of later professional competence. However, motivation appeared more limited in its effects, both individually and in interaction with cognitive level. It is suggested that it is primarily for the maintenance of competence in the most difficult activities, later in the career, that motivation becomes important, particularly in interaction with the cognitive dimension.—Author abstract.

5879. Klockhaus, Ruth. (13 Westorgraben, Nürnberg, W. Germany) **Führungsverhalten und Effektivität.** [Leadership behavior and effectiveness.] *Psychologie und Praxis*, 1970(Oct), Vol. 14(4), 145-160.—Discusses the question of how far the effectiveness of interacting worker groups can be influenced. Basis for the discussion is recent experimental data, generated by the Fiedler model. No original experimental data is presented. Since the least preferred co-worker score value, representing the sum of items on a semantic differential, can be interpreted in different ways, alternate possibilities for the increase in effectiveness is explored (e.g., task relevant variables).—R. F. Wagner.

5880. Levine, Edward L. & Katzell, Raymond A. (New York U.) **Effects of variations in control structure on group performance and satisfaction: A laboratory study.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 475-476.—Attempted to clarify the operation of 2 aspects of control structure indicated as relevant by organizational theory and research. Hypotheses tested include the following: (a) The higher the total amount of control of group members over decision-making and the more equally the members share this control, the better the group's problem-solving performance and the higher the satisfaction. (b) These effects may be partly accounted for by more positive socioemotional interaction within those groups with higher amounts and more equal distributions of control. 16 groups of undergraduates were used in each of 4 sets. Results generally support the hypotheses. The methodology, organizational simulation using controlled role-playing behaviors, seems promising.—Author abstract.

5881. Mase, Howard S. **The effects of interpersonal expectancy upon learning achievement in an industrial setting.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3744.

5882. McCarrey, Michael W. & Edwards, Shirley A. (Public Service Commission of Canada, Personnel Psychology Center, Ottawa, Ontario) **Hierarchies of scientific need referents: Their subject and performance correlates.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 493-494.—Analysis of the perceived importance of 9 job characteristics or need referents relevant to job satisfaction of 71 research biologists revealed 2 distinct hierarchies. A majority of scientists gave greatest importance to a number of personal and professional achievement factors and to recognition secondarily. In contrast, recognition in various forms was given primary importance by a minority subgroup. Analysis of the correlates of need referent importance indicated the recognition orientation was related to quantity of published output but that achievement orientation was related to quality of published work.—Author abstract.

5883. Moreland, Stephen & Barnes, John A. **Exploratory study of pilot performance during high ambient temperatures/humidity.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Mar), No. 6-70, 90 p.—Measured performance changes in 4 fully qualified Army pilots, wearing complete operational combat flight clothing and equipment. Ss flew a light observation helicopter during periods of high ambient temperature and humidity. Important relationships were found between physiological changes and crew station environment. An equation

is presented to quantify a hypothetical relationship between performance, environment, and physiological changes. (17 ref.)—Journal abstract.

5884. Paul, J. P., Robertson, K. B., & Herzberg, F. **Job enrichment pays off.** *Harvard Business Review*, 1969(Mar), Vol. 47(2), 61-78.—Reports on a series of studies in various British firms which are attempting to determine how Herzberg's concept of job enrichment might profitably be applied. The experiments in the main yielded positive results and this approach to employee motivation is highly recommended.—C. F. Youngberg.

5885. Pennings, Johannes M. (U. Michigan, Inst. for Social Research) **Work-value systems of white-collar workers.** *Administrative Science Quarterly*, 1970(Dec), Vol. 15(4), 397-406.—Attempted to ascertain to what degree structural factors might explain variance in the work-value systems of white-collar workers. Herzberg's dual-factor theory of job satisfaction is challenged by relating value systems of white-collar workers to the promotion rates of their organization. Findings indicate that the importance attributed to intrinsic work aspects varies with promotion rates. (20 ref.)—A. J. Kabany.

5886. Sloan, S. & Johnson, A. C. **New context of personnel appraisal.** *Harvard Business Review*, 1968(Nov), Vol. 46(6), 14-29. Due to various deficiencies, the trait approach is declining in popularity and being replaced by complex quantitative techniques. Considering the central importance of performance evaluation, management should support behavioral science research in this area.—C. F. Youngberg.

5887. Stewart, C. P. (Public Service Commission of Canada, Ottawa, Ontario) **Motivating the employee.** *Studies in Personnel Psychology*, 1970(Apr), Vol. 2(1), 89-93.—Summarizes the work being done by R. Ford of the American Telephone and Telegraph Company to reduce employee dissatisfaction, turnover, grievances, and loss of productivity. Ford's approach was based on F. Herzberg's job satisfaction theory. 7 ways of "improving" the job of women who answer complaint letters and telephone calls were introduced at a rate of 1/wk to an experimental group whose turnover, productivity, promotions, and attitudes were compared with a control group. The experimental group showed significant improvement over 6 mo., thus supporting the "job improvement" approach to employee motivation. (French abstract)—J. G. Tiedemann.

5888. Tosi, Henry. (Michigan State U.) **Effect of the interaction of leader behavior and subordinate authoritarianism.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 473-474. 488 managers responded to questionnaires containing measures of boss tolerance for freedom, their authoritarianism, influence, role conflict, role ambiguity, job satisfaction, and job threat and anxiety. Performance measures were also collected. A 2 x 2 analysis of variance using authoritarianism and boss tolerance for freedom as independent variables was performed. Performance was related to neither of the independent variables. Participation and job satisfaction were highest for a high authoritarian working for a low tolerance for a freedom boss and lowest for a low authoritarian under a high tolerance for freedom boss. Role conflict and job anxiety were highest under high tolerance for freedom bosses. They were not affected by authoritarianism.—Author abstract.

5889. Vineberg, Robert; Taylor, Elaine N., & Caylor, John S. (HumRRO, Monterey, Calif.) **Performance in**

five Army jobs by men at different aptitude (AFQT) levels: I. Purpose and design of study. *HumRRO Technical Report*, 1970(Nov), No. 70-18, 33 p.—Describes the rationale, research design, and general chronology of research events in a study of the performance and characteristics of effective and ineffective marginal personnel in the Army. 1800 men with experience ranging up to 20 yr. in 5 military occupational specialties were studied. The sample included a comparison group of men in the same jobs but coming from the upper (nonmarginal) part of the Armed Forces Qualification Test distribution. Performance was measured by intensive job sample tests, job knowledge tests, and supervisor ratings. Information about background, personal characteristics, and military experiences was obtained through biographical questionnaires, a battery of published and experimental tests, and Army records. —*HumRRO*.

5890. Vineberg, Robert; Taylor, Elaine N., & Sticht, Thomas G. (HumRRO, Monterey, Calif.) Performance in five Army jobs by men at different aptitude (AFQT) levels: II. Development and description of instruments. *HumRRO Technical Report*, 1970(Nov), No. 70-20, 286 p.—Continues the study by R. Vineburg, E. N. Taylor, and J. S. Caylor on the performance and characteristics of effective and ineffective marginal personnel in the Army. Information about background, personal characteristics, and military experiences was obtained through biographical questionnaires, a battery of published and experimental tests, and Army records. The data collection instruments, their development and administration, are described. —*HumRRO*.

5891. Weinstein, Alan G. & Srinivasan, V. (Carnegie-Mellon U.) Prediction of managerial compensation. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 483-484.—Annual compensation of 136 alumni of Carnegie-Mellon University Graduate School of Industrial Administration (GSIA) was predicted using years of work experience, graduate grades, and data obtained prior to admission to GSIA. Stepwise multiple regression analyses indicated that work experience was highly predictive of staff but not line compensation. After adjusting for the effect of work experience, graduate grades significantly predicted line but not staff earnings. Some pregraduate academic variables were also significant predictors. Of special interest were the ratings on social activity and ratings on sports activity which predicted staff and line adjusted compensation, respectively. Results support the ability to predict managerial compensation prior to career entry. —*Author abstract*.

5892. Wiley, Llewellyn N. & Cagwin, Leland P. Comparing prediction of job performance ratings from trait ratings for aircraft mechanics and administrative airmen. *USAF AFHRL Technical Report*, 1968(Oct), No. 68-108, 26 p.—Supervisors in all commands rated aircraft mechanics on overall job performance and on 65 work-related traits. Of 1290 rates, there were 852 who were rated by each of 2 supervisors. Trait predictions of overall performance yielded R^2 s ranging from .78 to .94, and cross-validation R^2 s from .33 to .86. Interpretations involved comparisons with previous findings obtained from ratings on administrative airmen. The analyses added confirmation in a different career ladder of most of the administrative ladder findings and suggested that there are some areas where the interpretations cannot be generalized from 1 work

situation to another. It is concluded that any supervisor should be able to make this type of rating if given an opportunity to observe the man. Particular attention should be given to the opportunity of supervisors to observe men. —*USAF AFHRL*.

5893. Wood, Donald A. (Indiana U., Graduate School of Business) Enhancing attitude-performance relationships by degree of job involvement. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 494-496.—Examined differential effects of low and high job involvement on job performance-job satisfaction relationships for female machine operators in a small nonunion packaging plant. All satisfaction items measuring 4 intrinsic and 5 extrinsic areas related insignificantly to both actual productivity scores and paired-comparison ratings averaged across 1st- and 2nd-line supervision. However, those low on job involvement expressed significantly greater extrinsic satisfaction with wages and the company as actual productivity scores increased while those high on job involvement indicated significantly greater dissatisfaction with intrinsic areas of recognition and advancement. Performance appraisal was more reliable for the high job involvement group, but only the performance levels in the low job involvement group were significantly predicted by 4 different ability tests. The accentuation of certain attitude-performance relationships was shown to be greatly facilitated through involvement moderation. —*Author abstract*.

MANAGEMENT & ORGANIZATION

5894. Barth, Richard T. & Ace, Merle E. (U. British Columbia, Vancouver, Canada) Relationships between the urgency and attainment of various environmental factors relevant to engineers and scientists. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 489-490.—Investigated the relationship between the perceived attainment (rather than satisfaction) of 68 intergroup climate factors and the urgency these elicit with respect to improving the perceived actual intergroup climate to the preferred ideal for 256 engineers and scientists representing 10 research and development organizations. Results indicate: (a) an inverted V shaped distribution between attainment and urgency; (b) a positive correlation between low attainment and urgency, but a negative correlation between high attainment and urgency; and (c) factors of extreme attainment or lack of attainment are rated less urgent than factors of moderate attainment. —*Author abstract*.

5895. Brown, Julius S. (Loyola U., Los Angeles, Calif.) Risk propensity in decision making: A comparison of business and public school administrators. *Administrative Science Quarterly*, 1970(Dec), Vol. 15(4), 473-481.—Compared the risk propensity of business and public school administrators on qualitative and realistic decision problems. Each problem was combined with a quantitative decision matrix to make it consonant with the expected value of utilities concept of decision theory in economics. Relevant organizational and personality variables were measured. Business administrators were found to be greater risk takers than public school administrators. (28 ref.) 4 J. Kahany.

5896. Carroll, Stephen J., Cintron, Dennis, & Toul, Henry L. (U. Maryland, Behavioral Science Div.) Factors related to how superiors establish goals and

review performance for their subordinates. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 497-498.—Attempted to identify the characteristics of the superior and of the situation which were related to how the superior established goals and reviewed performance. Data collected from 112 managers in a national industrial firm were used in the analysis. A number of factors were found to be related to types of goals established, procedures used to establish goals, and how frequently goal performance was reviewed. These include: how the superior's boss established goals and reviewed performance with him, the superior's personality, his perceptions of higher management support for the Management by Objectives program, and the subordinate's competence.—*Author abstract*.

5897. Ghorpade, Jaisingh. (San Diego State Coll.) **Assessment of organizational effectiveness: Issues, analysis, and readings.** Pacific Palisades, Calif: Good-year, 1971. x, 255 p. \$4.95(paper).

5898. Greenhaus, Jeffrey H., Gavin, James F., & Korman, Abraham K. (City Coll., City U. New York) **Organizational correlates of achievement, aggression, and acceptance of change.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 477-478.—Investigated the relationship between dimensions of organizational climate and relevant organizational criterion behaviors. 1st-line managers of a major airline participated in the study. 7 empirically derived climate factors were correlated with (self-reported and supervisory-rated) measures of achievement, aggression, and acceptance of change. The dimensions of organizational climate were most consistently related to acceptance of change and degree of intergroup conflict, and to a lesser extent with achievement motivation. Self-reports and supervisory ratings appeared to be equally related to organizational climate.—*Author abstract*.

5899. Korman, Abraham K. (New York U.) **The prediction of managerial performance: A preview.** *Studies in Personnel Psychology*, 1970(Apr), Vol. 2(1), 4-26.—Reviews and evaluates "research literature pertaining to the usefulness of various procedures in the prediction of leadership behavior in formal organizations in a selection context." The theoretical significance and contributions of the research reviewed to the psychological characteristics involved in leadership and to practical implications for selection and development procedures are discussed. The studies reviewed are grouped into 5 predictor categories: cognitive ability, personality and interest inventories, personal history data, peer ratings, and superior and faculty ratings. The investigators, description of the sample and study, N, predictors, criterion, and results of the studies reviewed are presented along with conclusions on the relative merits of each predictor category. (54 ref.)—J. G. Tiedemann.

5900. Kraut, Allen I. (IBM, Armonk, N.Y.) **Use of managers' peer ratings to predict executive success.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 485-486.—Examined the validity of managers' peer ratings in industry. Unlike raters in earlier research, managers in this study were led to believe the ratings would affect decisions about their careers (although they were kept just for research). For middle managers, peer ratings predicted promotional success, but not per-

formance appraisals. Among higher level (but slower moving) executives, ratings did not predict promotions but did predict appraisals. Peer ratings which reflect an individual's prominence were more predictive than ratings of his tactfulness. Correlations reached into the high 30s, despite the highly select nature of the groups. Results indicate that the use of managers' peer ratings is likely to select more successful executives. *Author abstract*.

5901. Larson, Raymond L. (U. Oregon) **A behavioral investigation of the pricing of intra-company transfers and the operation of the industrial firm organized under the profit center concept.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3094

5902. Lee, James A. **Developing managers in developing countries.** *Harvard Business Review* 1968(Nov), Vol. 46(6), 55-69.—Attempts at developing managers in the emerging countries must give consideration to the limited sources of managerial potential, intellectual deprivation, economic attitudes, concepts of what a manager is and does, and resistance to face-to-face criticism.—C. F. Youngberg.

5903. Narver, John C. (U. Washington, Graduate School of Business Administration) **Rational management responses to external effects.** *Academy of Management Journal*, 1971(Mar), Vol. 14(1), 99-115.—Discusses the external or side effects of business and rational responses to the external effects for profit-maximizing firms. It has been suggested that the rational response for the profit-maximizing firm is to do nothing about its external effects until required by law. This study, however, argues that the rational response is to take action. The meaning of externalities, of which pollution is a fundamental type, and the phases of a solution to such problems are discussed. Rational responses for the profit-maximizing firm regarding its externalities, are presented, in which many aspects of the popular arguments against the rationality and the practicability of independent corrective action by a firm are examined. (18 ref.) *Journal abstract*.

5904. Neubauer, Walter F. (Linz Coll. Social & Economic Science, Inst. for Psychology, Austria) **Studie zur Messung der individuellen Einstellung gegenüber dem Vorgesetzten in der Industrie.** [Study on the measurement of individual attitudes towards the manager in industry.] *Psychologische Rundschau* 1971(Jan), Vol. 22(1), 1-16.—108 16-60 yr. old employees evaluated their immediate managers on 15 category scales. The same scales were also used in deriving the profile of an ideal manager. Since the ideal profile was nearly concordant both in the group that showed the greatest deviations between the actual and ideal manager, and the group that showed the smallest deviation, it can be taken as a standard and the deviation from this standard as a measure of manager's evaluation.—W. J. Koppitz.

5905. Noë, W. K. **The relative importance of ten aspects of executive ability.** *Studies in Personnel Psychology*, 1970(Apr), Vol. 2(1), 44-47.—This is 4 of a series of studies on the dimensions of executive ability in the Public Service of Canada. The relative importance of 10 traits thought to be related to executive success was determined by 101 members of several Career Assessment Program courses using the pair-comparison method. Results indicate 4 clusters of traits from most important to least important: (a) leadership and judgment; (b) communication, analytical ability, quality

work, and administrative skills; (c) originality, knowledge, and risk-taking; and (d) quantity of work. (French abstract)—J. G. Tidemann.

5906. Pollay, Richard W. (U. British Columbia, Vancouver, Canada) **The structure of executive decisions and decision times.** *Administrative Science Quarterly*, 1970(Dec), Vol. 15(4), 459-471.—Doubt is thrown on the direct relationship between the difficulty of a decision problem and decision time. A formal theory is proposed, hypothesizing that decision-makers take longer to choose from 4 alternatives when 2 of the alternatives are easily rejected than when all 4 alternatives are equal. The results of laboratory experiments support this hypothesis, and suggest that decision behavior is related to personality factors. (17 ref.)—A. J. Kahany.

5907. Rowe, David K. (Macke Co., Cheverly, Md.) **Industrial relations management for profit and growth.** New York, N.Y.: American Management Assn., 1970. xii, 337 p. \$21.50.

5908. Tosi, Henry. (Michigan State U.) **Organization stress as a moderator of the relationship between influence and role response.** *Academy of Management Journal*, 1971(Mar), Vol. 14(1), 7-20.—Examines some aspects of the role-taking model proposed by R. L. Kahn et al. (see PA, Vol. 39 8866) Role conflict as measured by a questionnaire distributed by mail to 537 branch managers—is significantly related to job satisfaction and job threat and anxiety, but not to an effectiveness measure. Under different levels of organization stress, influence is not differentially related to the responses of job satisfaction, job threat, and anxiety. There is a slight relationship between influence and effectiveness in low stress situations, but not under high stress.—*Journal abstract*.

5909. Turney, John R., Rosen, Ned A., & Conklyn, Elizabeth D. (Cornell U.) **Early identification of managerial potential in a technical-professional organization.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 481-482.—This longitudinal study focuses on a number of paper-and-pencil measures and group interaction indices as possible predictors of managerial emergence in a relatively unstructured organization. The criterion was number of promotions during a 3-yr period. The data indicate 2 different patterns characteristic of managerial emergence depending on whether an employee is young or old. Successful young employees are characterized as aggressive or forceful; successful old employees as agreeable or passive. Successful young employees are rated more technically competent by their superiors than successful old employees. Data are discussed in terms of their implications for organizational effectiveness.—*Author abstract*.

5910. Witz, Klaus & O'Brien, Gordon. (U. Illinois) **Collaboration indices in structural role theory.** *Journal of Mathematical Psychology*, 1971(Feb), Vol. 8(1), 44-57.—Defines a central aspect of organizational structure—interposition collaboration—using the concepts of structural role theory. 4 indices for measuring different forms of structural collaboration are defined; 2 of these have been used in several empirical studies. The problem of finding maxima for 2 of the indices under suitable conditions is detailed. Ways in which the indices could be used to investigate the relationships between collaboration and organizational processes are discussed.—*Journal abstract*.

SPECIAL ENVIRONMENTS

5911. Collins, William E. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) **Effective approaches to disorientation familiarization for aviation personnel.** *FAA Office of Aviation Medicine Report*, 1970(Nov), No. 70-17, 19 p.—Discusses techniques for providing familiarization of aviation personnel with disorientation problems. The procedures are spelled out in detail. Methods of modifying existing equipment as well as an evaluation of available commercial equipment are presented. The techniques have been used with notable success both at the Civil Aeromedical Institute and in the field. They are relatively inexpensive, effective both for participants and Os, and are readily accepted by fliers as pertinent to the aviation situation. (27 ref.) *Author abstract*.

5912. Jones, R. Douglas. **Effects of thermal stress on human performance: A review and critique of existing methodology.** *U.S. Army Human Engineering Laboratories Technical Memorandum* 1970(May), No. 11-70, 71 p.—A critical review of the literature provides the basis for an analysis of the effects of thermal stress on human performance. Research in this area to date reflects a wide divergence of opinion regarding the magnitude, direction, and significance of performance changes occurring under conditions of high temperature, humidity, solar radiation, etc. An attempt to resolve major conflicts in experimental findings leads to a detailed examination of such factors as thermal stress indices, exposure times, and acclimatization. The role of the S in thermal stress research is discussed with emphasis on the contribution of such psychological variables as personality and motivation to performance change. Recommendations for future research are advanced.—*Journal abstract*.

5913. Mathieu, M. & Hadni, J. Cl. **La relation medecin-pilote.** [The relationship between physician and pilot.] *Information Psychosociologie*, 1970(Jan), Vol. 10(37-38), 61-83.—Discusses the motivation to fly military aircraft, flying accidents, and fears of accidents and their treatment. It is suggested that the best treatment is provided by physicians who are fliers themselves. S. G. Vandenberg.

5914. Simmons, William W. & Ambler, Rosalie K. **Isoniazid prophylaxis as an aviation risk. Preliminary report.** *USAFM*, 1969(Nov), No. 1093, 7 p.—Studied the question of the advisability of aviation personnel continuing in duties involving the actual control of aircraft while taking prophylactic isoniazid. Specifically, adverse side effects of the drug were looked for both subjectively and objectively while 8 personnel continued aviation duties. 15 aviation personnel were studied with clinical, laboratory, and psychometric examinations for a total of 862.5 person-hrs. of drug ingestion. No significant adverse side effects which were thought to constitute a hazard to the safe performance of flying duties were detected. Although the expected incidence of adverse drug effects from isoniazid is small and no significant effects were detected for this small sample, it is suggested that a large number of Ss be studied prior to formulating a statement of policy on this regard. Meanwhile, aviation duties for personnel undergoing 300 mg. remantel therapy are judged to be allowable provided the flight surgeon maintains close scrutiny over such men. The long duration of the

isoniazid therapy makes it economically desirable to continue personnel in a flight status.—*USN AMI*.

ADVERTISING & CONSUMER PSYCHOLOGY

5915. Andrews, I. R. & Valenzi, E. R. (Simon Fraser U., Burnaby, British Columbia, Canada) **Combining price, brand, and store cues to form an impression of product quality.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 649-650.—50 Ss rated consumer products on the basis of price, brand, and store information. Despite several significant interactions among cues, combined cue judgments were predicted with a high degree of accuracy by a simple weighted average of single cue responses. It is concluded that cue combination processes for consumer products are similar to those previously reported in research on personality impression formation. For the 2 products used in this study, product quality judgments were influenced much more by price information than by brand or store information.—*Author abstract*.

5916. Davis, Barbara J. (Northwestern U.) **Five variables and their association with consumer purchase behavior.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3099-3100.

5917. Friedman, Monroe P. (Eastern Michigan U.) **Consumer price comparisons in the supermarket: Role of packaging and pricing factors and the case for a new informational display.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 647-648.—Consumer spokesmen have recently questioned whether present conditions in the American marketplace permit accurate consumer comparisons of the prices of packaged retail products. The present study examined this question by testing 499 customers of an inner-city supermarket and 526 customers of a suburban supermarket on 6 sets of price-comparison problems. A 2×3 factorial design was utilized to explore packaging and pricing variables which were hypothesized to affect problem difficulty. Results support the hypotheses and suggest that the adoption by supermarkets of a new information display, called dual-price labels, would yield substantial reductions in difficulty level for many price-comparison problems.—*Author abstract*.

5918. Fromkin, Howard L., Olson, Jerry C., Dipboye, Robert L., & Barnaby, David. (Purdue U.) **A commodity theory analysis of consumer preferences for scarce products.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 653-654.—Several recent advertising campaigns emphasize that the product is scarce or available only in limited quantities. An organized formal statement of the notions implied in these advertising strategies is provided by Brock's commodity theory which posits that a commodity will be valued to the extent that it is perceived to be unavailable. This hypothesis was tested for nylon hose, under 2 levels of availability (low and high) and 2 levels of expectations of obtaining the product (possession and nonpossession). Tentative support was obtained for the hypothesis of increased valuation under conditions of perceived scarcity.—*Author abstract*.

5919. Geller, E. Scott; Wylie, Ruth G., & Farris, John C. (Virginia Polytechnic Inst.) **An attempt at applying prompting and reinforcement to pollution control.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 701-

702.—Studied the effectiveness of a procedure which combined prompting and reinforcement principles to modify behavior relevant to environmental pollution. During treatment customers entering a grocery store were handed a circular which urged them to buy drinks in returnable bottles (i.e., prompting); after making a purchase, customers were given social approval if they purchased drinks in returnable bottles (i.e., reinforcement). The ABA design indicated that beverage-buying behavior at 1 grocery store was markedly influenced by the treatment procedure; for 2 other markets, treatment effects were not pronounced. An explanation for the differential success of the prompting-reinforcement method is discussed.—*Author abstract*.

5920. Grass, Robert C., Winters, Lewis C., & Wallace, Wallace H. (E. I. du Pont de Nemours, Wilmington, Del.) **Communication effectiveness of advertising: A method of pretesting.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 656-660.—Describes a technique of pretesting print advertising (the method is also applicable to TV commercials) which involves independent measures of (a) the ability of an advertisement appearing in its natural environment to attract the attention of the target audience, and (b) the ability of the advertisement to teach the prescribed message to members of the target audience who read the advertisement under conditions of maximum (motivated) attention. These measures of attention level and teaching ability are then used in a mathematical model of communication effectiveness which predicts the performance of the advertisement in communicating its message objectives in the "real world."—*Author abstract*.

5921. Jacoby, Jacob. (Purdue U.) **Brand loyalty: A conceptual definition.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 655-656. While clear conceptualizations of phenomena ought to precede and shape measurement approaches rather than vice versa, the brand loyalty literature contains 8 varieties of operational definitions but no precise conceptual definition. Brand loyalty is conceptually defined in terms of 6 necessary and sufficient conditions as: (a) biased (i.e., nonrandom), (b) behavioral response, (c) expressed over time, (d) some decision-making unit, (e) with respect to 1 or more brands out of a set of such alternative brands, and (f) a function of psychological (decision-making, evaluative) processes. Each definitional element is discussed in some detail.—*Author abstract*.

5922. Moynour, Reza. (Ohio State U.) **An empirical investigation of multidimensional scaling and multidimensional unfolding to predict brand purchasing behavior.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-A), 3109-3110.

5923. Olshavsky, Richard W. & Miller, John A. (Indiana U.) **Effects of expectation and product performance on perceived product quality.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 651-652.—An experimental laboratory investigation of the effects of disconfirmation of expectancies in both directions (negative and positive, for a single product was performed. The hypothesis, stemming from dissonance theory, that overstatement of a low performance product will produce favorable product evaluation was confirmed. The hypothesis, also stemming from dissonance theory, that understatement of a high performance

product will produce unfavorable product evaluation was also confirmed. Results support the common belief that a little exaggeration in promotion of a complex multidimensional product has desirable effects.—*Author abstract.*

5924. Olson, Jerry C. & Jacoby, Jacob. (Purdue U.) **A construct validation study of brand loyalty.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 2), 657-658.—Operational definitions of brand loyalty abound, yet the reliability, interrelationship, and factor structure of these measures remains to be determined. 12 specific brand loyalty measures were administered to 177 undergraduates, with 32 Ss receiving a 2nd administration 3 wk. later. Results: (a) 10 of the measures possessed adequate stability; (b) all 12 measures were positively intercorrelated (coefficient alpha = .85 for the set); and (c) the optimal factor analytic solution explained 67% of the variance and yielded 4 factors—behavioral brand loyalty, attitudinal brand loyalty, multi-brand-loyalty, and general brand loyalty tendencies. These findings support a multidimensional conceptualization of brand loyalty and militate for richer and more complex brand loyalty measures.—*Author abstract.*

ENGINEERING PSYCHOLOGY

5927. Dudek, Richard A., et al. (Texas Tech U., Lubbock) **Standardization of tasks and measures for human factors research.** *U.S. Army Human Engineering Laboratories Technical Memorandum*, 1970(Mar). No. 19-70, 106 p.—Summarizes the proceedings of a conference held at Texas Tech University in March, 1970. The Center of Biotechnology and Human Performance is conducting a research program titled "Performance, Recovery and Man-Machine Effectiveness." This program's goals include measurement of man's ability to perform for long periods of time and his ability to recover from such performance. Environmental, task, and organizational variables affecting a variety of conceptualized man-machine systems are being studied. Means of sustaining performance and/or speeding recovery are being investigated and fundamental data on human performance and recovery will be used to evolve criteria for insuring efficient performance in small military units. (82 ref.)—*Journal abstract.*

5928. Mills, Robert G. **Use of contingent status information in diagnostic performance and related aspects for information design.** *USAF AMRL Technical Report*, 1968(Dec), No. 68-135, 22 p.—Investigated the ability of Os to use stimulus relationships in making predictive or diagnostic decisions, and considers implications of this area of research for application to man-machine systems. Os were required to make predictive estimates of the state of a system based on observations of sequentially presented qualitative subsystem status information. The status information was derived from 4-cell contingency tables containing event

frequencies and quantified by a correlation coefficient which varied from approximately 1 to -1. Results indicate that: (a) Os' estimates appear to be based on the relative frequency of cell events as opposed to a correlation solution, (b) there is greater accuracy when estimates are based on positive relationships, and (c) Os are capable of only very gross discrimination between various levels of relationship. Conclusions generally considered how these results might be used in "designing" the information structure of man-machine systems such that an operator's decision performance would be facilitated. (21 ref.)—*USAF AMRL.*

5929. Nikoiforov, G. S. (Leningrad State U., USSR) **Problém spoľehlivosti človeka-operátora v inžinýrské psychológii.** [Reliability problem and operation in engineering psychology.] *Psychologie v Ekonomické Praxi*, 1970, No. 4, 210-217.—Discusses the problem of operator reliability within the framework of engineering psychology. Machine reliability, man-machine connection, and the effect of a man in the control system are defined. Terminological questions concerning the theory of reliability of an operator are discussed. The definitions of operator's reliability, operator's failure, levels of the failure, and working efficiency are given. The survey of methods (mathematical theory of man reliability, medico-biological methods) for the evaluation of operator's reliability is presented. The micro (inner dimensions of a man) and the macro (black-box) methods of operator's reliability are compared. (English, German, & Russian summaries) (22 ref.)—*M. Lescinsky.*

Displays & Controls

5930. Strizeneč, Michal. (Slovak Academy of Sciences, Inst. of Experimental Psychology, Bratislava, Czechoslovakia) **Prediction of parametre changes in a simulated control system: II.** *Studia Psychologica*, 1970, Vol. 12(4), 249-257.—Tested factory operators by the same methods as those employed with apprentices and undergraduates in a preceding study. Essentially the same correlations were found. These groups of Ss were compared and the most important parameters of panel performance (number of correctly predicted steps, duration of prediction and size deviation) were determined. There is a correlation of statistical significance between performance and difficulty of rule, profession of apprentices, intelligence level, and work achievement. (Czech & Russian summaries)—*Journal abstract.*

DRIVING & SAFETY

5931. Biehl, B. & Fuhrmann, J. (Traffic Psychology Inst., Vienna, Austria) **Einfluss verschiedener Arten der Geschwindigkeitkontrolle auf die Geschwindigkeitwahl.** [Influence of various types of speed controls upon the driver's selection of speed.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit*, Vienna, 1969(Jan), No. 7, 29-33.—Studied the influence of various types of speed controls upon actual speeds. The speeds of 1367 4-wheel vehicles were measured at 6 sites with a speed limit of 50 km/hr. The measurements were made in part with well concealed radar devices and with a light barrier measuring device, unseen by the driver. The 5 different types of measuring conditions had significant influence upon the speeds driven. Therefore no statement about speeds irrespective of fact and kind

of measurement by radar can be made. (French summary)—*English summary*.

5932. Biehl, B., Fuhrmann, J., & Seydel, U. (Traffic Psychology Inst., Vienna, Austria) **Untersuchungen zur Wahrnehmbarkeit und Lesbarkeit von unterschiedlich gestalteten Kennzeichentafeln.** [Investigation into the ability to recognize and read various types of differing license plates.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 45-57.—Studied various questions relating to human ability to recognize, read, and retain the symbols on vehicle license plates. The combination found to be best of all symbol combinations studied consisted of 2 groups—3 letters and 3 figures. In a further test, the various types of reflecting license plates were tested regarding their lightness, legibility, and influence upon the estimation of distance as compared to vehicle licenses made of nonreflecting material. There were significant differences, necessitating an exact evaluation of the materials. (French summary)—*English summary*.

5933. Biehl, B. & Seydel, U. (Traffic Psychology Inst., Vienna, Austria) **Beeinflussung des Fahrverhaltens durch einen Medium-Tranquillizer.** [Influence of a medium tranquilizer on driving behavior.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 80-90.—Administered mesoridazine in various dosages and in various periods of medication to 85 Ss and its influence upon driving ability was studied. With short application and high dosages, a significant reducing effect upon the stress capacity of reaction behavior and an effect upon sensorimotor coordination were observed. With longer application and lower dosages, a reduction of RT for optical single signals, a factor which is of relatively small importance in driving behavior, was observed. Results suggest that mesoridazine in the recommended dosage of 5 mg. 3 times daily does not reduce the driving ability. Higher dosages are not recommended for drivers. With a medication period of 7 days there were no cumulative effects observed. (French summary)—*English summary*.

5934. Biehl, B. & Seydel, U. (Traffic Psychology Inst., Vienna, Austria) **Psychopharmaka und Verkehrstüchtigkeit.** [The importance of pharmacopsychology for traffic safety.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 67-79.—Discusses the importance of pharmacopsychology for traffic safety and the basic problems regarding experimental research on the effect of different drugs and combinations on driving. Statistical studies on the influence of drugs on accident frequency and accident risk are cited. Recommendations for operational measures are made. The simulator is considered to be the most useful device for recording the influence of drugs on driving. An order system of psychopharmaca with an empirical base is required. (French summary) (23 ref.)—*English summary*.

5935. Biehl, B., et al. (Traffic Psychology Inst., Vienna, Austria) **The measurement of fluency of driving.** *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 61-66.—Describes an apparatus for measuring fluent driving which is also suitable for driver-training. The apparatus gives optical and/or acoustical information on variations in fluency of driving due to centrifugal force as well as sudden acceleration or deceleration. Experiments compared the fluency of driving between groups of people, distinguished by stage of training and driving experience

and being trained with and without V-Gerät. The reason for the significantly more fluent driving after instruction with the V-Gerät is the "feed-back" stressed by indication of errors leading to faster and more intensive learning. A further survey investigated items of driver behavior which are essential for fluent driving. (French & German summaries)—*Journal summary*.

5936. Fuhrmann, J. (Traffic Psychology Inst., Vienna, Austria) **Prüfung einer Methode zur Erfassung des Verhaltens von Kraftfahrzeugen und Fussgängern an Überwegen.** [Applicability of a method for measuring driver and pedestrian behavior at crossings.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 21-28.—Studied the use of a counting method for comparative tests of different types of pedestrian crossings. There were significant differences on the 3 types of pedestrian crossings marked differently, regarding their effect upon the behavior of drivers and pedestrians. (French summary) (16 ref.)—*English summary*.

5937. Gheri, M. (Traffic Psychology Inst., Vienna, Austria) **Unterschiede im Erkennen von Verkehrszeichen in Abhängigkeit von deren Bedeutung.** [Differences in the recognition of traffic signals depending upon their meaning.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 34-44.—The time for recognizing traffic signs exposed by tachistoscope was tested in a group of drivers and a control group of nondrivers. There were significant differences in faster recognition due to the type of traffic signal and driving practice. The differences did not depend upon personal characteristics, e.g., extroversion and neuroticism. A further survey investigated the effect of penalty in connection with a certain traffic sign. Recognition of the sign did not restrain, but enforced Ss' perception of the signs. (French summary) (17 ref.)—*English summary*.

5938. Johansson, G. & Backlund, F. (Uppsala U. Sweden) **Drivers and road signs.** *Ergonomics* 1970(Nov), Vol. 13(6), 749-759.—Investigated the function of the road sign system as an information channel for car drivers. Data were gathered from more than 5000 car drivers stopped after passing a road sign on a Swedish highway. Results are as follows: (a) the overall probability of a road sign being noticed on passing was not higher than about .5; (b) the different signs studied formed a scale of recording probability of perception extending from a low group with a probability of being perceived of about .25 up to a group with probabilities between .60-.75; and (c) results verify the outcome of a previous investigation by G. Johansson and K. Rumar. It is concluded that the road sign system to a high degree does not achieve its purpose. (French & German summaries)—*Journal abstract*.

5939. Klehelsberg, D. (Tübingen U., Psychological Inst., W. Germany) **Zum Begriff des normvernünftigen des Kraftfahrers.** [About the notion of the motorist's standard way of acting.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969*(Jan), No. 7, 5-8.—The notion of standard behavior in the sense of a prevalent way of acting on the part of motorists, as well as in the sense of a way of acting as determined by the traffic rules, are related to the notion of "limiting value" in the physical sense. The relations between these notions are discussed in view of optimum feasibility of influence the manner of driving. (French summary)—*English summary*.

5940. Klinger, P. (Traffic Research Dept., Vienna, Austria) *Das V-Gerät, seine Wirkungsweise und Anwendungsmöglichkeiten.* ["V-Gerät": Technical operation and applicability.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969* (Jan), No. 7, 58-60.—Describes the physical characteristics and technical details of operation of a device which permits an exact definition of the critical values on smooth, wet, or sandy pavement. (French summary)—*English summary*

5941. Lombroso, Daniel. (Israel Inst. of Technology, School of Industrial Engineering, Haifa) *La valeur diagnostique du P.M.K. pour la détection des chauffeurs professionnels accidentés.* [Diagnostic value of the P.M.K. test in the detection of accident-prone professional drivers.] *Revue de Psychologie Appliquée, 1970, Vol. 20*(2), 81-100.—Reports results from administering Mira y Lopez' Myokinetic Psychodiagnostic test to a control group of 50 safe drivers and 2 experimental groups of 50 drivers each who had numerous accidents. It is concluded that differences between safe and unsafe drivers reside essentially in transitory states relative to the period of the accidents. Personality traits of the unsafe drivers are strong inhibitions, e.g., deficient nervous equilibrium, poor self-control, and very great anxiety. A neurosis syndrome among the accident-prone is discussed. The auto accident is seen as a phase of recidivism, a new symptom among other symptoms, and the expected behavior of a neurotic in a hopeless situation. (22 ref.)—*K. J. Hartman*

5942. Schuster, D. H. (Iowa State U.) *Two-year follow-up of official action taken against problem drivers.* *Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6*(Pt. 2), 505-506.—Evaluated the effectiveness of official action, such as probation or suspension of driver's license, on problem drivers. Official action was manipulated by randomly assigning more or less restriction of driving privilege than normally would have been given to a

problem driver at an individual driver improvement interview. 3 criteria of driving records in the subsequent 24 mo. were used in the nonlinear multiple regression analyses, number of moving violations, number of driving accidents, and amount of official action. The manipulated variable of interview action was found to interact significantly with measures of previous driving record in predicting follow up driving record.—*Author abstract*

5943. Seydel, U. (Traffic Psychology Inst., Vienna, Austria) *Die Beeinflussung des Fahrverhaltens durch Leit- und Randlinien auf Freilandstrassen: In Zusammenarbeit mit dem Verkehrstechnischen Dienst des KIV.* [The influence of middle and edge markings upon driving behavior.] *Kleine Fachbuchreihe, Kuratorium für Verkehrssicherheit, Vienna, 1969* (Jan), No. 7, 9-20.—Attempts to obtain the actual effect of middle and edge markings using the distance of a vehicle from the edge of the road measured under 12 different test conditions. The distance from the edge of the right side of the road was measured for 4800 vehicles. The following results were obtained: (a) After dark more drivers tend to use the part of the road nearer the middle provided the road is unmarked, whereas 10.8% drive beyond the middle and move to the opposite lane, possibly because of poor marking of the road edges; (b) After the installation of the middle markings there is a more uniform manner of driving, i.e., most drivers use the left part of the right lane. It seems that a middle line without an edge marking leads to an overestimation of the guiding function of the middle marking. This observation was made during daylight only. (c) If there are both middle and edge markings, the guiding effect of the middle marking is decreased to some extent; the combination of both markings creates a "field of tension" which leads potential "middle line drivers" who are accident prone back to the right lane. It is concluded that a combination of both middle and edge markings has a positive effect upon the behavior of drivers. (French summary)—*English summary.*

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents and is designed to lead the reader to subjects that are more specific than the general categories of the classification. When many abstract numbers are listed under a heading, the reader may conveniently find them by matching the numbers found under the two or more headings that specify his particular interest.

- Dial** (SEE Display)
- Diet** (SEE Food)
- Differential Reinforcement at Low Rates of Responding** (SEE Reinforcement Schedule)
- Digestive System** (see also Metabolism)
4300, 4316, 4413, 4417, 4432, 4442, 4443, 4444, 4445, 4481
- Digit** (SEE Number)
- Disability** (SEE Physical Handicap)
- Disarmament** (SEE War, International Relations)
- Discrimination** (see also Auditory Discrimination, Learning/Discrimination, Visual Discrimination, Rat/Discrimination in)
4022, 4194, 4613, 4649, 5478
- Discrimination Learning** (SEE Learning/Discrimination)
- Discrimination Reversal**
4270, 4404, 4482, 4484, 4513, 4517, 4521
- Discrimination/Racial** (SEE Integration, Prejudice, Social Movements)
- Disease** (see also Illness)
4750, 5310, 5354, 5380, 5381, 5385, 5386
- Displacement** (SEE Defense Mechanism)
- Display** (see also Control)
4272, 5833, 5917
- Dissonance** (see also Attitude Change)
4683, 4794, 4796, 4808, 5923
- Distance** (SEE Perception/Depth)
- Distraction** (SEE Attention)
- Diurnal Rhythms** (SEE Biological Rhythms)
- Divorce** (SEE Marital Problems)
- DNA** (SEE Biochemistry)
- Dog**
4287, 4304, 4306, 4311, 4313, 4314, 4336, 4356, 4419, 4425, 4432, 4491, 4492, 4496, 4497, 4498, 4554, 4568
- Dogmatism** (SEE Authoritarianism, Personality Trait)
- Dominance** (see also Authoritarianism)
4581, 4696, 4770, 4931
- Double Blind Design** (SEE Experimental Design)
- Down's Syndrome** (SEE Genetics, Mental Retardation)
- Draft** (SEE Military)
- Draw-a-Man Test** (SEE Projective Technique)
- Draw-A-Person Test** (SEE Projective Technique)
- Drawing** (see also Aesthetics, Creativity, Picture)
4257, 5146, 5352, 5720
- Dream & Dreaming** (see also Rapid Eye Movement, Sleep)
3979, 4145, 4146, 4147, 4148, 4711, 4990
- Drinking** (SEE Alcohol, Water & Water Intake)
- Drive** (SEE Motivation)
- Driving** (see also Safety)
5298, 5751, 5931, 5932, 5933, 5934, 5935, 5936, 5937, 5938, 5939, 5940, 5941, 5942, 5943
- DRI** (SFE Reinforcement Schedule)
- Dropout** (SEE School Dropout)
- Drug Addiction** (see also Drug Effects, Drugs)
4928, 4929, 4935, 4936, 5153, 5154, 5155, 5156, 5157
- Drug Effects** (SEE next headings, Drug Addiction)
- Drug Effects-Animal** (see also Rat/Drug Effects in, Cat/Drug Effects in, Drugs)
4365, 4389, 4393, 4396, 4397, 4399, 4400, 4402, 4403, 4411, 4412, 4419, 4421
- Drug Effects-Human** (see also Drug Addiction, Drugs)
4290, 4291, 4308, 4362, 4371, 4372, 4373, 4374, 4375, 4376, 4377, 4379, 4380, 4381, 4382, 4383, 4384, 4385, 4386, 4387, 4391, 5108, 5222, 5914, 5933, 5934
- Drug Therapy**
5094, 5095, 5096, 5097, 5098, 5099, 5100, 5101, 5102, 5103, 5104, 5105, 5106, 5108, 5109, 5111, 5112, 5113, 5114, 5115, 5116, 5221, 5297, 5325, 5487
- Drug Therapy-Schizophrenia**
5095, 5100, 5103, 5110, 5241, 5244, 5245
- Drug Usage & Abuse** (see also Drug Addiction, Drugs)
4597, 4922, 4923, 4924, 4925, 4928, 4929, 4932, 4933, 4934, 4935, 4936, 4970, 5093, 5153, 5155, 5157, 5190, 5393, 5428
- Drugs** (see also Amphetamine, Antidepressant Drugs, Chlorpromazine, Lysergic Acid Diethylamide, Marijuana, Tranquilizer)
4410, 4418, 5155
- Dyad** (SEE Group/Small, Interpersonal Processes)
- Dyslexia** (SEE Reading Deficiency)
- Ear** (see also Audition)
4125, 4132, 4138, 4234, 5312
- Eating** (SEE Food, Food Intake)
- Ecology** (SEE Environment)
- Education** (see also next headings, College Curriculum, School Teaching (Training))
5267, 5306, 5400, 5403, 5404, 5408, 5410, 5412, 5414, 5415, 5428, 5497, 5568, 5601, 5668, 5747, 5755, 5799
- Education/Adult** (SEE Education)
- Education/Physical**
3991, 3992, 4630, 5290, 5455, 5480, 5515, 5644, 5722, 5725, 5729, 5733, 5734, 5737, 5745
- Education/Programs In**
4746, 5266, 5458, 5487, 5489, 5496, 5501, 5525, 5595, 5611, 5677, 5717, 5718, 5730, 5731, 5733, 5736, 5738, 5739, 5740, 5742, 5743, 5744, 5745, 5746, 5748, 5750, 5752, 5754, 5759
- Education/Special**
5305, 5486, 5487, 5488, 5489, 5490, 5491, 5492, 5493, 5494, 5495, 5496, 5497, 5498, 5507, 5510, 5511, 5512, 5517, 5520, 5531, 5532, 5533, 5593, 5610, 5617
- Education/Special-Mental Retardation** (see also Mental Retardation/Learning in)
5341, 5349, 5353, 5514, 5515, 5516, 5519, 5521, 5522, 5524, 5525, 5526, 5527, 5528, 5529, 5530, 5603, 5606
- Education/Special-Remedial**
5499, 5500, 5501, 5502, 5503, 5649
- Educational Background**
4601, 4742, 4759, 4793, 4930, 4983, 5036, 5308, 5827, 5835, 5838, 5926
- Educational Guidance** (SEE Guidance/Educational)
- Educational Measurement** (see also Test/Achievement)
5457, 5458, 5459, 5460, 5462, 5464, 5466, 5468, 5469, 5470, 5474, 5475, 5476, 5478, 5481, 5484, 5485, 5708
- Educational Psychology**
3962, 5399, 5403, 5412, 5591, 5636, 5824
- Edwards Personal Preference Schedule** (SEE Test/Personality)
- Effort** (SEE Work & Work Analysis)
- Ego** (see also Self)
4768, 4772, 4942, 4944, 4972, 5270, 5420, 5447, 5474, 5625
- Electrical Activity** (see also Potential/Evoked)
4007, 4146, 4279, 4284, 4285, 4295, 4301, 4325, 4326, 4339, 4340, 4342, 4343, 4344, 4371, 4382, 4383, 4384, 4385, 4387, 4400, 4430, 5169, 5323
- Electrocardiogram** (SEE Electrophysiology, Cardiovascular Processes, Heart)
- Electroconvulsive Shock**
4049, 4565
- Electroconvulsive Shock Therapy**
5244
- Electrode** (SEE Electroencephalography, Electrical Activity)
- Electrodermal Response** (SEE Galvanic Skin Response)
- Electroencephalography** (see also Arousal)
4146, 4281, 4347, 4348, 4349, 4350, 4353, 4376, 4380, 4440, 5116, 5135, 5141, 5187, 5326, 5817
- Electroencephalography-Animal**
4325, 4342, 4344, 4345, 4356, 4363
- Electromyography** (see also Eye Movement, Muscle)
4155, 5324, 5817
- Electrophysiology**
4055, 4353, 4369
- Electroretinograph** (SEE Electrophysiology, Retina)
- Elimination**
4429, 5378
- Embedded Figures** (SEE Test/Intelligence, Dependency)
- Embryo** (see Pregnancy)
- Emotion** (see also Affect, Depression)
3975, 4160, 4164, 4382, 4383, 4387, 4433, 4472, 4477, 4596, 4602, 4632, 4674, 4695, 4822, 4835, 4891, 4898, 4913, 4938, 4958, 4963, 5162, 5184, 5256, 5312, 5329, 5387, 5399, 5588
- Emotional Disturbance** (see also Childhood, Emotional Disturbances in)
4792, 5038, 5050, 5060, 5210, 5352
- Emotionality** (see also Emotion)
4741, 4450, 4467, 4468, 4471, 4496
- Empathy** (see also Therapeutic Process)
4736, 4830, 4893, 5272, 5395, 5545, 5586
- Employee** (SEE Personnel/Industrial)
- Encephalitis** (SEE Brain Disorder)
- Encoding** (SEE Categorical Behavior, Memory, Thinking)
- Encounter Group** (SEE Sensitivity, Psychotherapy Group)
- Endocrine** (SEE Gland, Hormone)
- Endogenous-Exogenous Factor** (SEE Etiology)
- Engineering Psychology**
5927, 5928, 5929
- Engineers & Engineering** (SEE Occupation)
- Eureasis** (SEE Elimination)
- Environment** (see also Environment-Animal, Isolation, Temperature, Deprivation/Sensory, Urban & Suburban Environment, Rural Environment)
4004, 4140, 4141, 4832, 4939, 5189, 5210,

BRIEF SUBJECT INDEX

5344, 5353, 5389, 5443, 5446, 5471, 5494, 5596, 5883, 5903, 5919
Environment-Animal (see also Isolation, Depri-
 vation/Sensory, Temperature)
 4280, 4323, 4428, 4431, 4434, 4443, 4455,
 4535, 4581
Epilepsy
 5336, 5337
Epinephrine
 4329, 4381, 4406, 5222
EPPS (SEE Test/Personality)
Equipment (SEE Apparatus, Apparatus-An-
 imal)
Ergonomics (SEE Engineering Psychology,
 Industrial Psychology)
Error
 3971, 4029, 4108, 4113, 4196, 4515, 4641,
 4644, 4675, 5141, 5485, 5655
Escape
 4164, 4526, 4528, 4530, 4568, 4957
Esthetics (SEE Aesthetics)
Estimation
 4021, 4026, 4086, 4098, 4269, 5126, 5236
Ethics (see also Value & Values, Philosophy)
 5025
Ethology
 4620, 4638, 4647, 4656, 4669, 4674, 4684,
 4687, 4706, 4711, 4713, 4715, 4752, 4753,

 5616, 5619, 5657, 5672, 5697, 5759, 5881,
 5918, 5923, 5925
Experience (see also Familiarity, Practice)
 4268, 4276, 4781, 4879, 5823
Experience/Early
 4370, 4446, 4453, 4454, 4455, 4467, 4468,
 4578, 4581
Experimental Design
 4837, 4889
Experimental Psychology
 4045
Experimentation & Experiments (see also
 Research, Research Methods)
 4043, 4044, 4046, 4121, 5471
Experimenter Bias (SEE Bias, Experimenta-
 tion & Experiments)
Expert Testimony (SEE Law, Clinical Judg-
 ment)
Exploratory Behavior (see also Rat/Activity
 in)
 4463, 4470, 4534
Extinction (see also Extinction/Resistance to,
 Inhibition, Learning, Rat/Extinction in)
 4379, 4496, 4531, 4536, 4566, 4567, 4568,

4570, 4600, 4648, 4704, 5075, 5367
Extinction/Resistance to
 4572, 4573
Extrasensory Perception (SEE Parapsychol-
 ogy)
Extroversion-Introversion
 4440, 4787, 4802, 4872, 4968, 5384, 5386
Eye (see also Retina, Vision)
 4079, 4084, 4094, 4097, 4152, 4220, 4315,
 4340, 4495, 4826, 4872, 4878
Eye Movement (see also Rapid Eye Move-
 ment)
 4077, 4085, 4110, 4111, 4112, 4113, 4294
Eyelid Conditioning (SEE Conditioning/Eye-
 lid)
Facial Expression (SEE Communication/
 Nonverbal, Social Perception)
Factor Analysis (see also Correlation)
 4023, 4038, 4107, 4475, 4668, 4944, 5555
Faculty (SEE Teacher)
Failure (SEE Achievement, Emotion, Anxiety)
Faking (SEE Deception)
Familiarity (see also Experience, Practice)
 4083, 4216, 4239, 4243, 4246, 4580, 5863,
 5911
Family (see also next headings, Marriage,
 Mother, Father)
 4670, 4695, 4742, 4776, 4780, 5172, 5217,
 5218, 5226, 5319, 5332, 5352, 5383, 5580,
 5654
Family Planning (SEE Birth Control)
Family Relations (see also Parent-Child Re-
 lations)
 4708, 4759, 4780, 4781, 4792, 5151, 5189,
 5225, 5246, 5305, 5393, 5654, 5777
Family Therapy
 5049, 5067, 5242, 5281, 5336
Fantasy (see also Dream & Dreaming, Image-
 ry)
 4957, 5079
Farming (SEE Rural Environment, Occupa-
 tion)
Father (see also Parent-Child Relations)
 4611, 5229, 5349, 5581
Fatigue
 4143, 4168, 4174, 4429, 5344
Fear (see also Anxiety, Emotion, Motivation,
 Phobia, Threat)
 4454, 4473, 4683, 4961, 5073, 5143, 5913
Feeble-mindedness (SEE Mental Retardation)
Feedback (see also Reinforcement)
 4079, 4113, 4155, 4181, 4182, 4199, 4211,
 4265, 4275, 4287, 4360, 4829, 5148, 5320,
 5410, 5567, 5582, 5607, 5631, 5649, 5655,
 5669, 5788, 5800, 5812, 5844, 5850, 5860
Feeding (SEE Food Intake)
Feeling (SEE Emotion)
Femininity (SEE Sex Role)
Fetishism (SEE Sexual Deviation, Sexual
 Disorder)
Fetus (SEE Pregnancy)
Field Dependence (SEE Dependency)
Field Study (SEE Research Methods, Obser-
 vation)
Fighting (SEE Aggression, Hostility)
Figure Aftereffect (SEE Aftereffect)
Figure (SEE Stimulus, Pattern, Perception/
 Form & Shape)
Film
 4040, 4341, 5044, 5545, 5567, 5615, 5764,
 5781, 5860
Fine Arts (SEE Aesthetics, Literature, Music)
Finger (SEE Hand, Motor Performance,
 Body)
Fish
 4412, 4461, 4507, 4591
Flavor (SEE Taste)
Flicker Fusion (SEE Vision)
Food
 4051, 4279, 4481, 4542, 4557, 4562, 4660
Food Deprivation
 4479, 4481
Food Intake
 4280, 4316, 4322, 4323, 4324, 4407, 4418,

4442, 4443, 4448, 4450, 4453, 4456, 4459,
 4459, 4464, 4466, 4546, 4547, 5213
Food Preference (SEE Food Intake)
Forced Choice (SEE Choice Behavior, Item
 Response, Testing Methods)
Foreign Relations (SEE International Rela-
 tions)
Foreman (SEE Management)
Forgetting (SEE Extinction, Learning, Mem-
 ory, Retention)
Form Perception (SEE Perception Form &
 Shape)
Foster Home (SEE Family, Community Ser-
 vices)
France
 4895, 5678
Freud/S. (SEE Psychoanalysis, Psychoanaly-
 tic Theory)
Friendship (SEE Interpersonal Processes, In-
 terpersonal Attraction)
Frigidity (SEE Sexual Disorder)
Frog
 4295
Frontal Lobotomy (SEE Brain Lesion, Brain
 Lesion-Animal)
Frustration (see also Aggression, Conflict,
 Emotion)
 4474, 4477, 4755, 5285
Galvanic Skin Response
 4161, 4206, 4338, 4341, 4379, 5481, 5481
Game (see also Recreation)
 4254, 4262, 4264, 4265, 4695, 4706, 4849,
 4859, 5078, 5433, 5683, 5727
Game Theory (SEE Choice Behavior, Decision
 Making, Learning/Probability)
Gastrointestinal Processes (SEE Digestive
 System)
Generalization
 4194, 4217, 4305, 4395, 4511, 4515, 4560,
 5237, 5691
Generalization/Stimulus (SEE Transfer (Gen-
 eralization))
Genetics

BRIEF SUBJECT INDEX

- specific disorders)
3965, 5021, 5027, 5030, 5047, 5049, 5142,
5147, 5202, 5203, 5204, 5206, 5207, 5209,
5211, 5212, 5213, 5214, 5218, 5252, 5255,
5397
- Mental Health** (see also Adjustment/Personal
& Social, Community Services)
3984, 4988, 5068, 5117, 5258, 5259, 5262,
5263, 5264, 5265, 5266, 5269, 5270, 5394,
5395, 5431, 5731
- Mental Hospital & Hospitalization** (see also
Hospital & Hospitalization, Institution &
Institutionalization)
5033, 5034, 5037, 5041, 5118, 5119, 5120,
5123, 5126, 5197, 5206, 5246, 5352, 5394
- Mental Hospital/Programs in**
5118, 5121, 5124, 5125, 5127, 5128, 5130,
5131, 5241
- Mental Hygiene** (SEE Mental Health)
- Mental Patient** (SEE Psychiatric Patient)
- Mental Processes**
4338, 4596, 5457
- Mental Retardation** (see also next headings,
Learning, Learning Disorders)
5033, 5034, 5142, 5340, 5342, 5345, 5348,
5349, 5350, 5351, 5352, 5353, 5354, 5355,
5356, 5357, 5358, 5359, 5364, 5371, 5516,
5526, 5529
- Mental Retardation/Diagnosis of**
5142, 5338, 5343, 5346
- Mental Retardation/Education in** (SEE Edu-
cation/Special-Mental Retardation)
- Mental Retardation/Learning in**
5340, 5360, 5361, 5362, 5363, 5364, 5365,
5366, 5367, 5368, 5369, 5374, 5375, 5377,
5515, 5519, 5521, 5527
- Mental Retardation/Treatment of**
5037, 5110, 5339, 5344, 5347
- Mental Retardation/Vocational Rehabilitation
& Training in**
5340, 5343, 5370, 5371, 5372, 5373, 5374,
5375, 5376, 5377
- Meprobrate** (SEE Tranquilizer)
- Metabolism**
4279, 4283, 4299, 4363, 4365, 4413, 4417,
4427
- Method & Methodology** (see also Research
Methods, Teaching Methods, Experimen-
tation, Measurement, Survey, Experimental
Design)
3972, 3991, 3992, 3993, 3994, 3995, 3996,
3997, 4000, 4001, 4027, 4046, 4070, 4103,
4135, 4631, 4634, 4735, 4788, 4811, 4916,
4917, 5021, 5181, 5333, 5719, 5817, 5862,
5916
- Metropolitan Area** (SEE Urban & Suburban
Environment)
- Middle Age** (SEE Adulthood)
- Migration** (SEE Social Processes)
- Milieu Therapy** (SEE Mental Hospital/Pro-
grams in, Psychotherapy/Methods in)
- Military** (see also Personnel/Military)
5706, 5823, 5835, 5842, 5851, 5867, 5912
- Mind** (SEE Cognition, Thinking)
- Minnesota Multiphasic Personality Inventory
(MMPI)**
4922, 4999, 5000, 5047, 5147, 5165, 5176,
5380
- Minority Group** (SEE Ethnology)
- MMPI** (SEE Minnesota Multiphasic Person-
ality Inventory)
- Mobility** (SEE Movement, Social Mobility,
Socioeconomic Status)
- Model** (see also Imitation)
4003, 4004, 4006, 4007, 4008, 4009, 4010,
4011, 4012, 4013, 4014, 4015, 4016, 4017,
4018, 4019, 4033, 4037, 4053, 4109, 4115,
4217, 4227, 4627, 4653, 4749, 4798, 4813,
4844, 4908, 5130, 5278, 5287, 5563, 5575,
5583, 5588, 5628, 5682, 5822, 5874, 5925
- Money**
3990, 4758, 4797, 4869, 4875, 5125, 5872,
5891
- Mongolism** (SEE Mental Retardation)
- Monitoring** (SEE Detection, Attention)
- Monkey**
4310, 4312, 4335, 4340, 4397, 4399, 4403,
4447, 4453, 4469, 4470, 4533
- Monkey/Learning in**
4402, 4486, 4503, 4509, 4510, 4518, 4531,
4532, 4550, 4564
- Mood** (SEE Emotion)
- Morale** (SEE Job Satisfaction, Attitude, Emo-
tion)
- Morality** (SEE Value & Values, Religion,
Ethics)
- Mother** (see also Maternal Behavior, Parent-
Child Relations, Parent)
4613, 4626, 4709, 4741, 4786, 4792, 5349,
5407, 5577, 5581
- Mother-Child Relations** (SEE Parent-Child
Relations, Child Rearing)
- Motion** (SEE Movement)
- Motion Pictures** (SEE Film)
- Motivation** (see also next headings, Achieve-
ment Motivation, Incentive, Reinforce-
ment)
3999, 4002, 4005, 4068, 4143, 4156, 4166,
4171, 4254, 4277, 4424, 4450, 4489, 4604,
4619, 4630, 4740, 4806, 4819, 4858, 4875,
4959, 5134, 5272, 5420, 5430, 5440, 5445,
5484, 5546, 5684, 5730, 5789, 5829, 5863,
5872, 5878, 5884, 5887, 5913
- Motivation-Animal** (see also Rat/Motivation
in)
4298, 4403, 4419, 4444, 4463, 4464, 4469,
4470, 4474, 4477, 4478
- Motivation/Learning** (SEE Learning, Moti-
vation)
- Motivation Theory**
4195, 4474, 4476, 5805
- Motor Disorder**
5098, 5100, 5319
- Motor Learning** (SEE Learning/Motor)
- Motor Performance**
4159, 4168, 4174, 4175, 4176, 4177, 4178,
4181, 4183, 4184, 4231, 4377, 4388, 4414,
4533, 4633, 5303, 5327, 5480, 5513, 5684,
5712, 5734, 5737, 5745
- Motor Processes** (see also Learning, Motor,
Muscle)
4003, 4179, 4180, 4182, 4184, 4196, 4199,
4311, 4327, 4371, 4382, 4383, 4384, 4385,
4426, 4434, 4458, 4496, 4606, 4614, 5289,
5328, 5514, 5725, 5733, 5763
- Motor Skill** (SEE Motor Performance)
- Mouse**
4365, 4393, 4411, 4428, 4437, 4439, 4471,
4472, 4475, 4478, 4494, 4585
- Mouth** (SEE Body)
- Movement** (see also Social Movements)
4057, 4065, 4079, 4138, 4178, 4179, 4180,
4294, 4313, 4314, 4657, 4682, 5729, 5733,
5911, 5935
- Movement/Apparent** (SEE Gestalt Psychol-
ogy, Visual Perception)
- Muller-Lyer Illusion** (SEE Illusion)
- Multiple Sclerosis** (SEE Disease, Nervous
System/Disorder of)
- Murder** (SEE Crime & Criminals)
- Muscle** (see also Electromyography)
4007, 4140, 4155, 4184, 4293, 4333
- Muscle Sense** (SEE Kinesthesia, Somesthesia)
- Music**
4122, 4249, 4919, 4992
- Mutilism** (SEE Speech Defective)
- Myth & Mythology** (SEE Culture)
- Narcissism** (SEE Psychoanalytic Theory, Neu-
rosis, Personality Trait)
- Narcosis** (SEE Sleep, Drug Therapy)
- Narcotics** (SEE Drugs, Drug Addiction)
- Natural Observation** (SEE Observation)
- Navy** (SEE Military, Personnel/Military)
- Need** (see also Motivation)
4448, 4775, 4779, 4824, 4856, 4954, 5427,
5442, 5593, 5730, 5882
- Need Achievement** (SEE Achievement Moti-
vation)
- Negro**
4620, 4621, 4647, 4656, 4660, 4669, 4674,
4706, 4711, 4713, 4752, 4755, 4756, 4757,
4783, 4818, 4839, 4860, 5308, 5416, 5418,
5420, 5440, 5457, 5460, 5493, 5536, 5541,
5550, 5588, 5613, 5645, 5690, 5698, 5717,
5731, 5740, 5743, 5799, 5810
- Neonate** (see also Infancy)
4280, 4370, 4425, 4458, 4497, 4615, 4616,
4618, 4612, 4916
- Nerve** (SEE Neurology, Neuroanatomy)
- Nervous System** (see also next headings)
4291, 4478
- Nervous System/Autonomic**
4154, 4292, 4306, 4314, 4371, 4382, 4383,
4384, 4385, 4387, 4432, 4496, 5323
- Nervous System/Central**
4311, 4313, 4314, 4327, 4485
- Nervous System/Disorder of**
5080, 5102, 5135, 5141, 5167, 5247, 5322,
5325, 5326, 5330, 5392
- Neuroanatomy**
- Neuroanatomy-Animal**
- Neurology**
3982, 4006, 4017, 4054, 4097, 4279, 4281,
4285, 4286, 4288, 4289, 4290, 4292, 4292,
4294, 4300, 4302, 4303, 4307, 4308, 4360,
4361, 4362, 4386, 4919, 4921, 5141, 5671
- Neurology-Animal**
4282, 4283, 4284, 4287, 4293, 4295, 4296,
4297, 4298, 4299, 4301, 4306, 4339, 4359,
4389, 4391, 4428, 4430, 4432, 4434, 4491
- Neuron** (SEE Neurology, Neuroanatomy)
- Neurophysiology** (SEE Neurology, Neuro-
anatomy)
- Neurosis & Neuroticism** (see also specific
neuroses)
4292, 4432, 4440, 4787, 4847, 5084, 5109,
5133, 5142, 5147, 5201, 5215, 5216, 5220,
5222, 5223, 5226, 5332, 5384
- News & Newspaper** (SEE Communication
Mass)
- Nicotine** (SEE Smoking, Drugs, Biochemistry)
- Nictitating Membrane** (SEE Eye, Conditioning
Eyelid)
- Noise** (see also Audition, Sound)
4125, 4126, 4129, 4180, 4577, 5337
- Nondirective Therapy** (SEE Psychotherapy
Methods in)
- Nonsense & Nonsense Syllables** (SEE Asso-
ciation, Learning, Paired Associate, Word)
- Nonverbal Communication** (SEE Communi-
cation/Nonverbal)
- Noradrenalin** (SEE Hormone)
- Norephedrine** (SEE Hormone)
- Norm** (see also Value & Values, Social Influe-
nce)
3965, 4668, 4814, 4998, 5562
- Novelty** (SEE Familiarity)
- Number** (see also Mathematics)
- Nursery School** (SEE Childhood, Preschool)
- Nursing & Nurses** (see also Medicine, Per-
sonnel, Psychological)
4082, 5136, 5641
- Nutrition** (SEE Food)
- Nystagmus** (SEE Eye Movement)
- Obesity** (SEE Physique)
- Obituaries**
- Observation**
4045, 4452, 4480, 5410, 5709, 5719, 5759
- Obsession-Compulsion** (see also Mental Dis-
order, Neurosis, Psychosis, Personality
Trait)
4073, 5049, 5220
- Occupation** (see also Personnel/Industrial,
Work & Work Analysis)
4145, 4622, 4730, 4742, 4760, 4761, 4762,
4793, 4866, 4913, 4962, 5171, 5306, 5308,
5376, 5573, 5596, 5668, 5707, 5815, 5816,
5826, 5827, 5837, 5852, 5873, 5894
- Occupational Choice** (see also Guidance/
Vocational)
5539, 5541, 5542, 5544, 5546, 5547, 5824,
5825, 5826, 5828, 5830
- Occupational Interest**
5534, 5537, 5548, 5555, 5557, 5565, 5568,
5573, 5588, 5707, 5827

Occupational & Physical Therapy
5041, 5230**Oceanography** (SEE Environment)**Oedipus** (SEE Psychoanalytic Theory)**Old Age** (SEE Geriatrics, Gerontology)**Olfaction** (SEE Smell)**Open-Field Behavior** (SEE Activity, Rat, Activity in)**Operant Behavior** (SEE Conditioning, Operant)**Opinion** (see also Attitude)

4810, 4811, 4812, 4871, 5035

Optic Nerve (SEE Neurology, Neuroanatomy)**Oral Character** (SEE Psychoanalytic Theory)**Organ Implantation & Transplantation** (SEE Surgery)**Organizational Structure**

4837, 5056, 5535, 5602, 5678, 5746, 5822, 5873, 5880, 5885, 5894, 5896, 5898, 5901, 5907, 5910

Organizations

5897, 5908

Orientation

4094, 4274, 4306, 4363, 4463, 4489, 4498, 4604, 4608, 4649, 4650, 4858, 4889, 4943, 5295, 5358, 5609, 5752, 5911

Orienting Response (SEE Orientation)**Outpatient** (SEE Treatment/Outpatient)**Overlearning** (SEE Learning)**Oxygen** (SEE Respiration, Biochemistry)**Pain** (see also Somesthesia)**Paired Associate Learning** (SEE Learning/ Paired Associate)**Palsy** (SEE Nervous System/Disorder of, Physical Handicap)**Paralysis** (SEE Nervous System/Disorder of, Physical Handicap)**Paranoia** (see also Psychosis, Neurosis, Schizophrenia, Personality Trait)

5176, 5217, 5283

Parapsychology

3972, 3973, 3974, 3975, 3977, 3978, 3979

Parent (SEE Father, Mother, Parent-Child Relations)**Parent-Child Relations** (see also Family Relations)

4435, 4611, 4613, 4626, 4689, 4696, 4701, 4702, 4703, 4704, 4705, 4706, 4709, 4715, 4718, 4741, 4761, 4782, 4790, 4846, 4962, 4978, 5005, 5080, 5086, 5192, 5225, 5229, 5284, 5288, 5336, 5349, 5368, 5383, 5409, 5425, 5436, 5460, 5524, 5543, 5690, 5709, 5776, 5799, 5916

Parkinson's Disease (SEE Nervous System Disorder of)**Pastoral Counseling** (SEE Counseling)**Paternal Deprivation** (SEE Father, Parent-Child Relations)**Pathogenesis** (SEE Etiology)**Patient** (see also Psychiatric Patient)

5129, 5178

Pattern

4004, 4106, 4108, 4128, 4517

Peace (SEE International Relations, War)**Peace Corps** (SEE Government, International Relations)**Peak Experience** (SEE Emotion)**Peer Rating** (SEE Peers)**Peers**

4696, 4870, 5091, 5452, 5480, 5543, 5644, 5650, 5679, 5710, 5725, 5900

Penitentiary (SEE Prison)**Perception** (see also next headings, Intersensory Processes, Childhood/Perception in)

3966, 3971, 3974, 4055, 4057, 4058, 4059, 4060, 4061, 4146, 4159, 4367, 4731, 4784, 4919, 5014, 5217, 5289, 5296, 5406, 5408, 5667, 5770, 5833, 5850

Perception/Auditory (SEE Auditory Perception)**Perception/Depth**

4065, 4100, 4587, 4590

Perception/Form & Shape

4065, 4081, 4105, 4107, 4109, 4355, 4451,

4672, 4676, 5363

Perception/Size

4098, 5363

Perception/Social (SEE Social Perception)**Perception/Space**

4082, 4095, 4096, 4097, 4447, 4680, 5291, 5295

Perception/Time

4066, 4067, 4068, 4097

Perception/Visual (SEE Visual Perception)**Perception/Weight** (SEE Weight, Perception)**Perceptual Defense** (SEE Defense Mechanism)**Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)**Performance** (see also Job Performance, Motor Performance)

4045, 4141, 5854, 5862, 5912, 5927

Perseveration (SEE Personality Trait, Thinking)**Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)

3980, 3982, 3996, 4148, 4719, 4729, 4740, 4772, 4903, 4937, 4950, 4970, 4971, 5048, 5189, 5217, 5306, 5385, 5453, 5456, 5547, 5559, 5596, 5708, 5725, 5834, 5876, 5906

Personality Change

4830, 5312, 5331, 5443, 5494, 5553

Personality Correlates

4925, 4945, 4972, 4975, 5187, 5308, 5380, 5539, 5724, 5896, 5909

Personality Diagnosis (SEE Personality Measurement, Test Personality)**Personality Disorder** (SEE Emotional Disturbance, Neurosis)**Personality Inventory** (SEE Personality Measurement)**Personality Measurement**

4725, 4993, 4994, 4995, 4997, 5140, 5201, 5403, 5542, 5545

Personality Test (SEE Test/Personality)**Personality Theory**

4195, 4941

Personality Trait (see also Inventory)

4156, 4176, 4441, 4716, 4742, 4764, 4800, 4802, 4867, 4876, 4881, 4934, 4939, 4946, 4952, 4956, 4962, 4963, 4965, 4978, 5027, 5307, 5395, 5451, 5467, 5558, 5561, 5634, 5711, 5728, 5830, 5871, 5905

Personality/Assessment of (SEE Personality Measurement)**Personality/Childhood** (SEE Childhood/Personality in)**Personnel** (see also next headings)

5311, 5813, 5836, 5848, 5871, 5879, 5884, 5885, 5886, 5899

Personnel/Industrial

4775, 5265, 5819, 5830, 5839, 5841, 5859, 5878, 5881, 5887, 5893, 5894, 5904, 5929, 5930

Personnel/Military

4144, 4928, 4929, 4935, 4936, 4983, 5379, 5388, 5389, 5706, 5823, 5829, 5834, 5844, 5845, 5849, 5858, 5861, 5864, 5865, 5869, 5870, 5875, 5877, 5883, 5889, 5890, 5892, 5913, 5914

Personnel/Psychological (see also Counselor, Nurse, Psychiatrist, Psychologist, Therapist)

5017, 5033, 5034, 5037, 5042, 5119, 5131, 5261, 5362, 5395

Persuasion (see also Interpersonal Influence, Social Influence)

4806

Phenomenology

3964

Phenylketonuria (SEE Genetics, Mental Disorder, Mental Retardation)**Philosophy** (see also Existentialism)

3965, 3966, 3967, 3968, 3969, 3971, 3980, 4060, 4145, 4884

Phobia (see also Anxiety, Fear)

5061, 5086, 5087, 5091, 5202, 5219, 5223, 5227, 5425

Phoneme (SEE Word, Language)**Phonetics** (SEE Speech, Verbal Behavior, Language)**Photic** (SEE Light)**Photograph** (SEE Picture)**Physical Education** (SEE Education/Physical)**Physical Handicap** (see also Blindness, Childhood/Handicapped, Deafness & Hearing Disorder, Motor Disorder)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan.), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.).—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

5d—Text of the abstract.

6—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper)

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams" (5) (See (5a) PA, (5b) Vol 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

Abbreviations appearing in this issue include along with units of measurement (e.g., in., inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
AC = alternating current
ACTH = adrenocorticotrophic hormone
AM = ante meridiem
amp. = ampere

bpm = beats per minute

C = centigrade
¢ = cents
CA = chronological age
cc = cubic centimeter
CE.R = conditioned emotional response
CFP = critical flicker frequency
CNS = central nervous system
cps = cycles per second
CR = conditioned response (or reflex)
CRF = continuous reinforcement
CRT = cathode ray tube
CS = conditioned stimulus
CVC = consonant-vowel-consonant

db. = decibel
DC = direct current
DL = differential lumen
DNA = deoxyribonucleic acid
DRL = differential reinforcement of low rates

F = experimenter
FCS = electroconvulsive shock
EEG = electroencephalogram (or -graphy)
EKG = electrocardiogram
EMG = electromyogram
ESP = extrasensory perception
Exp. = experiment

F = Fahrenheit
ft-c = foot-candle
ft-l. = foot-lambert

g = gravity
gm. = gram(s)
GPA = grade-point average
GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
im = intramuscularly
ip = intraperitoneally
IQ(s) = intelligence quotient(s)
ITI = intertrial interval
iv = intravenously

kc. = kilocycle
kg. = kilogram
kg/m = kilogram per meter
kHz. = kilo-Hertz

LD = lethal dose
LSD = lysergic acid diethylamide

m. = meter
M = mean
M = mole or molar
ma. = milliamperce
MA = mental age
MAO = monoaminoxidase
mL. = millilambert
mm. = millimeter
mph = miles per hour
msec. = millisecond(s)

N = number
NREM = nonrapid eye movement

O = observer

p = probability
% = percent

PM = post meridiem
pps = pulses per second
PRE = partial reinforcement effect
PSE = point of subjective equality
psi = pounds per sq. in.

r = product-moment correlation
r = roentgen
REM = rapid eye movement
rms = root mean square
RNA = ribonucleic acid
rpm = revolutions per minute
RT = reaction time

S = subject
SEU = subjectively expected utility
SPL = sound pressure level

TV = television

UCR = unconditioned response
UCS = unconditioned stimulus
UHF = ultrahigh frequency

V = volt
VHF = very high frequency
vs. = versus

YMCA = Young Men's Christian Association
YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
California F Scale (Fascism)
CMA scale = Children's Manifest Anxiety scale
CPI = California Psychological Inventory
CTMM = California Test of Mental Maturity
EPSS = Edwards Personal Preference Schedule
MA scale = (Taylor) Manifest Anxiety scale
MMPI = Minnesota Multiphasic Personality Inventory
MPI = Mandelkern Personality Inventory
16 PF = Cattell's 16 Personality Factor Questionnaire
SVIB = Strong Vocational Interest Blank
TAT = Thematic Apperception Test
WAIS = Wechsler Adult Intelligence Scale
WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
Assoc. = associates
Co. = company
Coll. = college
Corp. = corporation
Dept. = department
Div. = division
Inst. = institute
Hosp. = hospital
Lab. = laboratory
Inc. = incorporated
U. = university

Ave. = avenue
Bldg. = building
Blvd. = boulevard
Ct. = court
Dr. = drive
Ft. = fort
Mt. = mount
Pkwy. = parkway
Pl. = place
PO = post office
Rd. = road
St. = street
N, S, E, W = North, South, East, West
U.S. = United States
USSR = Union of Soviet Socialist Republic

VOLUME 46

OCTOBER 1971

NUMBER 4

GENERAL

OBITUARIES

HISTORY

5944. Adorno, Theodor W. *Die Freudsche Theorie und die Struktur der faschistischen Propaganda.* [Freudian theory and the pattern of fascist propaganda.] *Psyche, Stuttgart*, 1970(Jul), Vol. 24(7), 486-509.

5945. Erikson, Erik H. *On the nature of psycho-historical evidence: In search of Gandhi.* In D. A. Rustow (Ed.), "Philosophers and kings: Studies in leadership." (See PA, Vol. 46:Issue 4) 33-68.

5946. Gottheld, Rene. (Cuyo National U., Mendoza, Argentina) *Historia de la psicología en la Argentina: I.* [History of psychology in Argentina: I.] *Revista Latinoamericana de Psicología*, 1969, Vol. 1(1), 13-33.—Psychology in Argentina during the times of the Spanish colonial period was mainly a scholastic discipline, taught at the universities. In the era of independence there were 3 periods: (a) the ideology period, during which Lafinur, Fernandez de Agüero, and Alcorta made important contributions to psychology; (b) the romantic period, centered more in action than in ideas; and (c) the eclectic period, with Amadeo Jacques. *English abstract.*

PHILOSOPHY

5947. Gray, Paul D. (Ohio State U.) *A defense of P. F. Strawson's theory of self.* *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4837.

5948. Ornstein, Jack H. (U. California, San Diego) *A critique of the mind-brain identity theory and a defense of a multi-aspect theory of the mind.* *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4842-4843.

PARAPSYCHOLOGY

5949. Moss, Thelma & Gengerelli, J. A. (U. California, Center for the Health Sciences, Los Angeles) *ESP effects generated by affective states.* *Behavioral Neuropsychiatry*, 1970(Dec), Vol. 2(9-10), 8-12. Replication was attempted of a laboratory study where telepathy seemed to occur between 2 people, isolated from each other, when "transmitter" (T) was emotionally aroused and "receiver" (R) was relaxed. In the present study 72 T-R teams were divided into 3 groups: LSP, non-LSP, and HSP? (according to expressed beliefs), and the dependent variable was a forced choice by Rs (rather than the matching of protocols by judges). Significant results ($p = .003$) were obtained only with the ESP group. Post-hoc regrouping of teams into "artists" and "nonartists" gave highly significant results ($p = .000005$) for "artists."—*Journal abstract.*

THEORY & SYSTEMS

5950. Ardila, Rubén. *Desarrollo de la psicología latinoamericana.* [Development of Latin American psychology.] *Revista Latinoamericana de Psicología*, 1969, Vol. 1(1), 65-71.—Describes the development of Latin American psychology as a science and as a profession, and emphasizes the social forces which shaped its present state. Today, psychology is taught in 16 Latin American countries, 13 countries have professional associations of psychologists, and 42 psychological journals are published in Latin America (19 ref.)—*English abstract.*

5951. Bannister, D. (Ed.) (Bexley Hosp., England) *Perspectives in personal construct theory.* London, England: Academic Press, 1970. xii, 273 p. \$11.50.

5952. Goble, Frank G. *The third force: The psychology of Abraham Maslow.* New York, N.Y.: Grossman, 1970. xii, 201 p. \$7.95.

5953. Wallach, Isaac. (Duke U.) *Implications of recent work in philosophy of science for the role of operational definition in psychology.* *Psychological Reports*, 1971(Apr), Vol. 28(2), 583-608.—Reports that philosophers of science have recently shown that not only extreme operationism but any operationist position faces very serious difficulties. Psychology has tended to take for granted that only "data language" or "observation terms" have direct empirical meaning, and that the empirical meaning of all other terms is given by their operational definitions. Strong arguments are outlined which indicate both that such "observation terms" are impossible to distinguish and that there are other indirect sources of empirical meaning besides operational definitions. If these arguments are correct, 2 conclusions follow: (a) it can no longer be maintained that psychological concepts must be "reconstructed" in terms of operational definitions, and (b) there is no longer any basis for failing to require the justification of operational definitions used in psychological research. (2 p. ref.)—*Journal abstract.*

5954. Walsh, Anthony A. (U. New Hampshire) *Contributions to the history of psychology: XIII. Bibliographia phrenologica.* *Psychological Reports*, 1971(Apr), Vol. 28(2), 641-642.—Presents a description of a bibliographic listing of 383 items concerned with phrenology and available from the American Society for Information Science. Some research underway is mentioned. (23 ref.)—*Journal abstract.*

EDUCATION & TRAINING

5955. Leah, Terry V. (U. Lethbridge, Alberta, Canada) *Zen meditation and the development of empathy in counselors.* *Journal of Humanistic Psychology*, 1970(Spring), Vol. 10(1), 39-74. 39 graduate students enrolled in counseling courses participated in an experiment designed to learn if practicing zazen could assist counselors to improve their empathic abilities.

Experimental Ss, who volunteered for meditation, practiced zazen 30 min. each weekday over 4 wk. Of 2 control groups, which did not meditate, 1 consisted also of volunteers for zazen and 1 of meditation refusers. Tests of affective sensitivity (empathy), of openness to experience, and of self-actualization were administered to all Ss before and after treatment. Experimental Ss improved their empathic abilities significantly: control Ss did not. The effect is greatest in persons with low initial abilities. Both openness to experience and self-actualization are positively related to empathic ability. Depth of concentration reached in zazen is positively related to openness to experience. (50 ref.) *P. Swartz*

PROFESSIONAL DEVELOPMENTS

5956. Brozek, Josef. (Lehigh U.) *Psicología estadounidense y psicología soviética en 1971*. [American psychology and Soviet psychology in 1971.] *Revista Latinoamericana de Psicología*, 1971, Vol. 3(1), 51-72.—Discusses barriers to scientific communication between the United States and the Soviet Union, and describes for each country undergraduate and graduate psychology curricula, degrees and diplomas awarded, research institutions, and relations to the neighboring fields. (23 ref.)—*English abstract.*

5957. Hyams, Lyon. (Rutgers State U., Medical School) *The practical psychology of biostatistical consultation*. *Biometrics*, 1971(Mar), Vol. 27(1), 201-211. Beginning with the premise that consultations with biological scientists are frequently characterized by communication difficulties, an attempt is made to provide insights into their etiology through the consideration of the seemingly different expectations and behaviors of consultants and clients. General issues and interpersonal problems are brought into focus by stereotypic characterizations. Suggestions for upgrading the consulting relationship are advanced that depend on the empathetic understanding of the client's position and a more realistic self-appraisal.—*R. L. McCornack.*

5958. Miller, George A. (Rockefeller U.) *On turning psychology over to the unwashed*. *Psychology Today*, 1969(Dec), Vol. 3(7), 53-55, 66-74.—Nonpsychologists are suspicious of the goals of psychology. Since control of behavior is emphasized, laymen want to know who will decide what behaviors should be reinforced. "Understanding and prediction are better goals for psychology than is control—better for both psychology and for the promotion of human welfare—because they lead us to think, not in terms of coercion by a powerful elite, but in terms of the diagnosis of problems and the development of programs that can enrich the lives of every citizen." Every effort should be made to pass on the principles of psychology to the public rather than depending on either professional psychologists or industrialists and politicians to apply psychology. *E. J. Posavac.*

INTERNATIONAL PSYCHOLOGY

5959. Benbeniste, Narciso & Read, Maria C. *Nivel psicológico*. [True psychology.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 25-40. Argues for a definition of psychology characterized by "interaction." Pointing out the need for a science to be defined with respect to other disciplines studying the same general phenomena, the notion is developed that psychology may be conceptualized as a study of the interaction of organisms with their environment, as opposed to a study

of the reactions of the same organisms. The evolutionary emergence of complex, hierarchically organized structures is discussed, and they are shown to require complex rather than reductionist study. Similarly, an argument is made for approaches within psychology which will, for example, look at affective as well as cognitive factors in development, and consider the joint effects of these on the person. It is pointed out that the statistically derived conceptions of normality are of little value without a full understanding of the multiple factors which, in interaction with one another, affect a person's adjustment to his environment.—*S. M. Halpin.*

5960. Dukov, Aleist V. *Vvedenie v sudebnuyu psikhologiyu*. [Introduction to the forensic psychology.] Moscow, USSR: Yuridicheskaya Literatura, 1970. 158 p. 57 K.

5961. Krantz, David L. & Wouters-Koster, Lia. (Lake Forest Coll.) *Publication patterns in Dutch psychology*. *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Jan), Vol. 26(1), 52-59.—The American research machine has been described as being high-speed, hard-working, well-supported, sets its own goals, spirals from 1 project to another, and is conditioned not to incorporate foreign materials. European research, however, is more extended in time and stresses the qualitative and theoretical with emphasis on fundamental issues. With reference to Dutch research in psychology, it was found that 90% of all publications are written in Dutch for local consumption to improve local conditions. 18% of the psychologists published 75% of all the pages published. The majority of the scientific papers in psychology are published by a small core of members from the doctoral class. The low productivity in publications by the doctorandus class is explainable by its heavy burden in teaching. Also the limited opportunity for employment for a doctor-professor has reduced the motivation for publication among the members of the doctorandus class.—*A. J. Ter Keurst*

5965. Lukaszewski, Wieslaw. *Niezgodność informacji i aktywność*. [Incomptability of information and activity II.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 35-59. Considers fundamental forms of information incompatibility between coded information and information input. A model is proposed which stands for the system of coded information and defines the organism's normal states and relations to his environ-

ment. 2 model types are distinguished: those generally conveyed to the organism and those taught. The features of information incompatibility and the degree of consolidation of the model are considered decisive for the organism's selection of methods to eliminate incompatibilities. Small and excessively great incompatibilities do not evoke tendencies to self-elimination (an area of lack of activity). Medium degrees of incompatibility provoke the organism to (a) changes in input information, (b) partial changes in both systems of information, or (c) a change of models. Several hypotheses derived from these considerations are considered. (Russian summary) (45 ref.).—*English summary*.

MODELS & MATHEMATICAL MODELS

MATHEMATICS & STATISTICS

5967. Baird, John C. & Stein, Timothy. (Dartmouth Coll.) **When power functions fail: A theoretical explanation.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 415-425.—When the simple power function fails to describe psychophysical results, it is necessary to add or subtract a constant from either the stimuli or responses in order to reinstitute a power function. It is suggested that this failure results from the nonlinearity of the function between the Weber fraction and stimulus intensity. Computer simulation experiments were conducted which support this contention. (20 ref.).—*Journal abstract*.

5968. Breidenkamp, J. (U. Heidelberg, W. Germany) **Über Masse der Praktischen Signifikanz.** [Measures of practical significance.] *Zeitschrift für Psychologie*, 1970, Vol. 177(3-4), 310-318.—Discusses 8 different measures of practical significance. All measures can be reduced to the basic equation $(\text{Var}(t) - \text{Var}(e))/\text{Var}(f)$. The practical significance is always equal to the relative part in the total variance which can be explained by a variation of conditions. The 7 variance analyses with a fixed factor can be reduced to 2 basic measures: one expressing the practical relevance of the spot-check result; and the other expressing the practical significance in the population. When the independent variable of the examination is a change factor, the practical significance can be estimated by calculating the intraclass correlation.—*P. von Toal*.

5969. Joe, George W. (Texas Christian U., Inst. of Behavioral Research) **Comment on Overall and Spiegel's "Least squares analysis of experimental data."** *Psychological Bulletin*, 1971(May), Vol. 75(5), 364-366.—Discusses the model employed by J. Overall and D. Spiegel (see PA, Vol. 44:1534) in their design matrix in the use of a multiple regression technique to the problem of analysis of variance.—*Journal abstract*.

Factor Analysis

5973. Brogden, Hubert E. (Purdue U.) **Further comments on the interpretation of factors.** *Psychological Bulletin*, 1971(May), Vol. 75(5), 362-363.—Discusses the suggestion of C. Harris (see PA, Vol. 46:Issue 4), concerning a paper by H. E. Brogden, that the matrix of weights on the latent test vectors which reproduce the factors is 1 among many matrices that might be used for factor score estimation and that one must choose among these. After clarification of certain features of the paper (see PA, Vol. 44:1536), a distinction is made between factor score estimation and factor interpretation. It is suggested that weight matrices appropriate for estimation may not be appropriate for interpretation. It is concluded that Harris's comments do not seem to be relevant to the earlier paper on factor interpretation.—*Journal abstract*.

5974. Harris, Chester W. (U. California, Santa Barbara) **On Brogden's interpretation of factors.** *Psychological Bulletin*, 1971(May), Vol. 75(5), 360-361.—Discusses the interpretations of factors proposed by H. E. Brogden (see PA, Vol. 44:1536) which provides weights for application to the (generally unavailable) common parts of the data and not to the data themselves. If the weights are applied to the data themselves, the result is 1 of several possible estimates of common factor scores. These weights are not, in general, proportional to the factor pattern. It is suggested, however, that this proportionality can be achieved if the final oblique solution is developed by means of the C. Harris and H. Kaiser (see PA, Vol. 39:9008) independent cluster algorithm. Such a solution guarantees proportionality of 2 sets of weights: those to estimate the variables from the factors, and those that might be used, following Brogden, to estimate factor scores from the variables.—*Journal abstract*.

5978. Marshall, Clifford & Maguire, Thomas O. (U. Alberta, Edmonton, Canada) **The computer as social pressure to produce conformity in a simple perceptual task.** *AV Communication Review*, 1971(Spring), Vol. 19(1), 19-28.—In a study to determine the effect of

the computer as an authority with the effects of simulated social pressure in bringing about individual agreement in a simple perceptual task, 98 Ss were exposed to a standard IBM 1500 computer-assisted instruction (CAI) system. The task consisted of the presentation of a single vertical line on the image projector for 3 sec. S was then asked to choose which of 5 alternative lines which subsequently appeared matched the stimulus line. 7 groups were used: (a) 3 groups received simulated social pressure of varying forms; (b) 3 groups received pressure from the computer to choose either the correct, a larger, or a smaller line, respectively; and (c) a no-pressure control group. Results indicate that computer pressure can produce the same type of results as true social pressure. Perceptual judgments can be manipulated by false information presented in a CAI situation.—*D. E. Anderson.*

TESTING

5983. Lourens, P. J. (National Inst. for Personnel Research, Johannesburg, South Africa) **Die aard, funksies en tekortkominge van sielkundige meting.** [The nature, functions and shortcomings of psychological measurement.] *Psychologia Africana*, 1970(Oct), Vol. 13(2-3), 149-172.—Describes the scientific task as the collection, rational processing, and communication of information concerning empirical entities. Scientific standards deduced from this formulation include coverage, comprehensiveness of implications, reliability, and contribution to understanding. A definition of measurement is presented, following a review of instances of measurement. Measurement is compared with other general procedures which are (in principle) available to the scientist, e.g., intuition, verbal formulation, simulation. It is concluded that measurement has important advantages; however, if used without due consideration of all relevant factors, it can give rise to misleading or erroneous results. Exclusive reliance on measurement may exclude important areas from scientific scrutiny. The concept of a psychological test is defined and a "typical" psychometric situation is analyzed in detail.

The relationship of reliability to validity, the relation between test definition and validity, the question of whether all tests have to be validated, and the heterogeneous nature of psychological investigations are discussed. (29 ref.)—*English summary.*

Construction & Validation

EXPERIMENTATION & OBSERVATION

5984. Bootzin, Richard R. (Northwestern U.) **Expectancy and individual differences in experimenter bias.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 303-312.—2 experiments, involving a total of 35 Es (male volunteer undergraduates) and 205 Ss (undergraduates), were performed to determine whether E's expectancy mediates E bias and to identify personality correlates of E bias. E's predictions of S's performance were employed as a convergent measure of expectancy along with the usual induced expectancies. The experimental task was the standard Rosenthal person-perception task. In both experiments the E's expectancy (as represented by the E's predictions) was a determinant of S performance while the induction was not. There was some support for the hypothesis that the dominance and self-confidence of the E is related to the magnitude of the induced expectancy effect obtained.—*Journal summary.*

5985. Pereboom, A. C. (Louisiana State U.) **Some fundamental problems in experimental psychology: An overview.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 439-455.—The application of the experimental approach to a multidimensional discipline presupposes that it will work, that control and analysis will generate explanations which will lead to a unified theory for a restricted behavior domain, and that there will be a fundamental basis for our concepts, scales, and methods which will justify the measurable generalization of that theory. Yet little of this appears to be happening. It is suggested that, in the name of basic research, more effort be directed toward fitting our empirical approach to the subject matter rather than attempting to do the reverse. This may mean less control, greater descriptive generality, and more tolerance for diverse theoretical positions. (3 p. ref.)—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

5986. Anan'ev, B. G. (Ed.) **Eksperimental'naya i prikladnaya psikhologiya.** [Experimental and applied psychology.] Leningrad, USSR: Leningrad U., 1970. 112 p. 51 K.

5987. Colotla, Victor A. & Gallegos de Colotla, Xochitl. (Alcoholism & Drug Addiction Research Foundation of Ontario, Psychological Lab, Toronto, Canada) **Un glosario de términos del análisis experimental de la conducta en el idioma español.** [A glossary of terms of the experimental analysis of behavior in the Spanish language.] *Revista Latinoamericana de Psicología*, 1971, Vol. 3(1), 37-50.—Stresses the importance of the experimental analysis of behavior in contemporary psychology. It is noted that Latin American psychologists do not show, with the exception of isolated instances, interest in this new area of modern psychology. Presented is a glossary of suggested Spanish translations in the field of the experimental analysis of behavior, in the hope that it will contribute to the arousal of interest in

this area among Spanish-speaking psychologists. (31 ref.)—*English abstract.*

5988. Ough, C. S. & Amerine, M. A. (U. California, Davis) **Effect of subjects' sex, experience, and training on their red wine color-preference patterns.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 395-398.—11 experienced adult Ss and 98 inexperienced undergraduates had essentially the same preference patterns for red table wine color, showing a tendency to prefer the middle brightness and the red hue (compared to orange or purple). Male and female undergraduates had very similar preference patterns. There was a slight tendency for the male Ss to prefer the wines with lower brightness. The 9 highly trained Ss tended to prefer the wine colors with decreasing brightness. The over-dark, purple wine was distinctly disliked by the adult and student Ss and the preference was split for the experts. The danger of using a highly trained panel to predict preference of an inexperienced group is evident.—*Journal abstract.*

PERCEPTION

5989. Ellis, Newton C. (Texas A & M U.) **Using proximities analysis in the quantification of stimulus similarity.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 403-406.—Experimental questions were: (a) can the psychological space implied by judgments of similarity be recovered and represented metrically; and (b) will it approximate the preconstructed physical space of the stimuli, and if so, what are the implications? Complex, physically similar stimuli were constructed according to rules of circumplex analysis; similarities judgments were obtained using the complete method of triads, and judgment data were examined by proximities analysis. Results demonstrate that the psychological space was recoverable and closely resembled the physical similarity of the stimuli.—*Journal abstract.*

5991. Hester, Gene A. (U. Texas, Medical School, San Antonio) **Effects of active movement on body-part size estimates.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 607-613.—Obtained body-part size estimates of 20 male 19-29 yr. old undergraduates under normal room illumination and under 3 basic conditions: (a) active movement of a joint-bounded body part prior to making an estimate of that part, (b) active movement of a different body part prior to making an estimate of a joint-bounded and non-joint bounded body parts as well as familiar nonbody objects; and (c) no movement prior to making an estimate of joint-bounded and non-joint-bounded body parts as well as nonbody objects. Results do not support the hypotheses that induced muscular tension or increased attention to the estimating task creates an enhancing effect upon size judgments from pictorial memory of body or nonbody stimuli. Other findings, e.g., overestimation of the head width and variability in estimation of the waist, were consistent with previous studies. (16 ref.)—*Journal abstract.*

5992. Hill, John W. (Stanford Research Inst., Menlo Park, Calif.) **Processing of tactual and visual point stimuli sequentially presented at high rates.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 340-348.—Investigated the differences between tactile and visual localization and temporal ordering ability using a

sequential presentation of 4- and 6-point stimuli in a 3×8 matrix of stimulators, 1 at a time, at onset intervals of 10-200 msec. The visual and tactile experiments were made as similar as possible by using analogous displays, identical experimental procedures, and the same 2 undergraduate Ss. Results show (a) that ordering a large number of points required considerably larger onset intervals than ordering a smaller number, (b) that ordering tactually presented points was more difficult than ordering the same number of visually presented points, and (c) that the ability to localize the points reached a minimum with a 50-msec onset interval. Tests show that this dip in performance with onset interval was not due to spatially dependent masking. (17 ref.)—*Journal abstract.*

5993. Koen, Frank. (U. Michigan) **Verbal mediators in cross-modal form discrimination.** *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 103-110.—Studied (a) the direction in which cross-modal discrimination is better (from vision to touch or vice versa), and (b) the nature and function of the mechanisms involved. Ss were 20 undergraduates in a pretest, and 40 undergraduate and graduate students in the main experiment. 2 sets of stimulus items differing in the degree to which they elicited verbal labels were used. The independent variables were perception and discrimination modalities, stimulus "nameability," and label use. On the basis of total error scores, perception modality, label use, nameability, perception \times discrimination, and perception \times label use were significant effects. The pattern of errors, however, indicates that verbal factors may be more strongly associated with false negatives than false positives, and more important as intramodal than as cross-modal mediators. Label use may either facilitate or depress performance, depending on the perceptual-cognitive operations that precede label "attainment." (French summary)—*Journal abstract.*

Illusion

5995. Kosliski, N. & Dewar, R. (U. Calgary, Alberta, Canada) **Tactile and kinesthetic influences on visual figural aftereffects.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 399-402.—Presented 12 18 28 yr. old and female college students with a bent line inspection (I) figure followed by a straight line test (I) figure under 4 different conditions in order to produce a figural aftereffect (IAE) of a bent line. In the visual condition S saw the I figure and then the I figure. In the tactile condition S held a curved bar and viewed the I figure simultaneously. The 2 kinesthetic conditions required S feel a straight or curved bar and view the I figure simultaneously. In both the kinesthetic and tactile curved-bar conditions, Ss showed a strong tendency to perceive the visual I figure as curved. In the other conditions Ss perceived the I figure as bent (the usual effect produced by this combination of I and I figures). Results demonstrate the influence of kinesthetic and tactile stimulation on visual FAE.—*Journal abstract.*

5998. Terstenjak, Antun. **K vprašanju interakcije med zaznavo svetlobe in časa.** [The perception of time under conditions of darkness and moderate illumination.] *Revija za Psihologiju*, 1970, Vol. 1(1), 27-31.—2 groups of 12 males each were asked to reproduce time intervals of 2, 4, and 8 min. 1 group was in total darkness and the other under illumination of 350 lux. The 8-min interval was significantly overestimated in darkness but underestimated in the light condition. 2- and 4-min intervals were underestimated under both conditions, the greatest underestimation being for the 2-min interval under the light condition.—*English summary*.

VISION

5999. Blake, R. Randolph; Fox, Robert, & McIntyre, Curtis. (Vanderbilt U.) **Stochastic properties of stabilized-image binocular rivalry alternations.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 327-332.—Conducted an experiment which consisted of a stochastic analysis of rivalry alternations produced by stimuli retinally stabilized by the method of enduring afterimages to determine whether the source of the random effect resided in a central mechanism or could be attributable to peripheral receptor variables, e.g., eye movements. The patterns of stabilized-image rivalry of 3 trained male Os were analyzed by a runs test, autocorrelation, and by fit to a theoretical gamma distribution. Analyses reveal that the successive durations were sequentially independent random variables similar to the pattern found for unstabilized rivalry. These data demonstrate that the source of the random effect must reside within a central mechanism and cannot be due to peripheral receptor variables. (15 ref.)—*Journal abstract*.

6000. Ernest, John T. (Walter Reed Army Medical Center, Inst. of Research, Washington, D.C.) **Night vision testing.** *Military Medicine*, 1971(Apr), Vol. 136(4), 381-382. Describes a psychophysical method for the demonstration of night vision defect simulation. This method could be used in distinguishing between a patient reporting false negatives and a person with completely subconscious hysterical amblyopia. Those individuals with hysterical amblyopia manifest a rapid fatigueability and after reaching an absolute visual threshold they show a slow elevation of this threshold as the examination progresses.—*G. A. Clum*.

A list of 1293 references brings up to date C. Landis' bibliography on flicker fusion. CODEN abbreviations, periodical titles, and subject index are included.—*Journal abstract*.

6002. Heinemann, Ludwig G. (Missouri Inst. of Psychiatry, St. Louis) **Visual phenomena in long sensory deprivation.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 563-570.—In order to study the spontaneous production of visual patterns without structured input under the condition of several days of sensory deprivation the observations of a 32-yr-old male physician over 108 and 128 hr were tape recorded; one study including immobilization, the other acoustical isolation. The phenomena depended on illumination and

on time from start. Very bright light suppressed imagery, bright daylight was associated with moving bright commas, average daylight in the room produced irregular patterns of darker circles, later multiple apparent objects composed of circular elements, often in geometrical arrays. There was a different style of phenomena with closed eyes: colored spots, later showing textural qualities, movements of elements and areas, flickering brightness changes, jumping white lines, and pictures with dark backgrounds. Phenomena are interpreted as randomly arising events of dark-perception, inhibition, color perception, and as patterns arising from complex functions that have been studied in constancy phenomena.—*Journal abstract*.

Perception

6007. Canon, Lance K. (U. Washington) **Directed attention and maladaptive "adaptation" to displacement of the visual field.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 403-408.—24 male undergraduates, wearing binocular, 30-diopter prisms inducing lateral displacement of the visual field, tracked a moving target during a 10-min exposure period. The experimental group received simultaneous visual and auditory stimuli from this target, but was instructed to attend to, and localize exclusively in terms of, the visual stimuli available. 2 control groups operated with (a) similar instructions but with only visual stimuli available, or (b) localized the target on the basis of either visual or auditory cues that were successively but never simultaneously presented. As predicted, only postexposure shifts in auditory localizations developed, and these occurred only in the experimental condition, where the exposure circumstances provided intermodality inconsistency of input regarding the spatial locus of the target. (15 ref.)—*Journal abstract*.

6013. Lindauer, Martin S. (State University Coll. New York, Brockport) **Effect of clues in perceiving the "good figure."** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 588.—Investigated the perception of the good figure (one organized according to balance, simplicity, and symmetry) with 2 groups of randomly assigned Ss, 27 in each. 1 group received instructions for a preference task, the other did not. A positive effect for instructions was found. Results suggest that an unaided response to a shape does not lead to an awareness of good figure and that test guidance can assist aesthetic judgment.—P. Hertzberg.

6014. Merikle, Philip M., Lowe, Douglas G., & Coltheart, Max. (U. Waterloo, Ontario, Canada) **Familiarity and method of report as determinants of tachistoscopic performance.** *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 167-174.—Presented 168 7-letter sequences, representing either 1st- or 2nd-order approximations to English, for 150 msec. and masked them immediately after presentation. For 2 different groups of 14 undergraduates each, performance was evaluated by either a partial-report (PR) or a full-report (FR) procedure. In general, 2nd-order approximations were better recalled regardless of the method of report, and the overall magnitude of the familiarity effect was approximately the same under both PR and FR procedures. The different methods of report, however, led to quite different accuracy functions across the letter rows. Results indicate that familiarity, as defined by differences in sequential redundancy, has its effect during processing but that left-to-right sequential processing may not necessarily be involved. (French summary)—*Journal summary*.

6015. Miller, Leon K. (U. Illinois) **Methodological note on masking effects in vision.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 582.—Examined identification rates of tachistoscopically presented discrete stimuli for 10 undergraduates with normal vision in each of 2 groups. Lower levels of performance were found when targets were followed by patterned stimulation, performance being more sensitive to difference among Ss. Results suggest methodological difficulties which may occur when comparing the effect of various posttarget fields upon performance, i.e., variance persisted even when equivalent levels of performance of various poststimulus conditions were found.—P. Hertzberg.

6017. Shulman, Harvey G., & Greenberg, Seth N. (Human Performance Center, Columbus, O.) **Perceptual deficit due to division of attention between memory and perception.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 171-176.—Administered a perceptual recognition task to 16 male undergraduates and a comparative judgment task to 16 male and 16 female undergraduates. Performance was studied as a function of the information storage demands made by a concurrently performed short-term memory task. Performance on the perceptual tasks was inversely related to memory load both when recognition rate was the dependent variable and when RT was measured under conditions of nearly errorless performance.—*Journal abstract*.

Size & Distance & Depth Perception

6018. Baird, John C., Romer, Daniel, & Stein, Timothy. (Dartmouth Coll.) **Test of a cognitive theory of psychophysics: Size discrimination.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 495-501.—The cognitive theory of psychophysics proposed in an earlier paper by J. C. Baird claims that the ratio of exponents obtained in the method of magnitude estimation for 2 stimulus attributes is equal to the ratio of information transmitted in the method of absolute judgment for those attributes. This theoretical prediction was tested experimentally for visual length and area. 40 university summer school students were Ss and served independently in 4 conditions, judging the attribute of length and of area with the method of absolute judgment and of magnitude estimation. Results partially support the prediction, inasmuch as the ordinal relations among exponents (length higher than area) was the same as the ordinal relation among information measures. However, in 1 instance, the exact quantitative relationship was significantly different from the predicted value. *Journal abstract*.

6019. Birnbaum, Michael H., Parducci, Allen, & Gifford, Robert K. (U. California, Los Angeles) **Contextual effects in information integration.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 158-170.—Category judgments of the average lengths of sets of lines are inconsistent with context-independent models of information integration: the effects of any particular line upon the judgment of average length varies inversely with the lengths of the other lines within the same set. This interaction, obtained in 5 separate experiments with a total of 211 undergraduates, was similar to that previously reported for auditory intensities. The judgments reflect (a) within-set effects, in which the judgment of the set varies directly with the range of values within the set; and (b) between-set effects, in which the apparent interaction between the stimuli within a set depends upon the context provided by the different sets. The context between sets is postulated to affect only the response scale; when the responses are rescaled to allow for the between-set context, the integrated impression is dependent upon both the mean and the range of components within the set. (18 ref.)—*Journal abstract*.

• Color Vision

6022. Letourneau, Jacques & Zeidel, Neil S. (U. Montreal, School of Optometry, Quebec, Canada) **The effect of sound on the perception of color.** *American Journal of Optometry & Archives of American Academy of Optometry*, 1971(Feb), Vol. 48(2), 133-137. Results of an experiment with 6-18-30-yr old experimentally naive men and 6 women indicate that sensitivity to white and green light increased under the influence of a pure sound of 1000 cps given at the intensities of 50, 70, and 90 db. Sensitivity to red light diminished only when the intensity of the sound had reached 70 db. Increase in sound intensity did not produce a proportional increase in the sensitivity to white and green light, but did decrease visual sensitivity to a certain extent in the case of red light. A control group of 3 Ss demonstrated that time alone had no effect upon the visual thresholds. —*Journal abstract.*

Form & Pattern Discrimination

6023. Dodwell, Peter C. (Queen's U., Kingston, Ontario, Canada) **Visual pattern recognition.** New York, N.Y.: Holt, Rinehart, & Winston, 1970. x, 276 p.

6024. Noton, David & Stark, Lawrence. (U. Colorado) **Scanpaths in eye movements during pattern perception.** *Science*, 1971(Jan), Vol. 171(3968), 308-311.—1 male and 3 female undergraduates learned and recognized patterns which were marginally visible, requiring them to fixate directly each feature to which they wished to attend. Fixed "scanpaths," specific to subject and pattern, appeared in their saccadic eye movements, both intermittently during learning and in initial eye movements during recognition. A proposed theory of pattern perception explains these results. —*Journal abstract.*

Eye Movement

6025. Bakan, Paul. (Michigan State U.) **The eyes have it.** *Psychology Today*, 1971(Apr), Vol. 4(1), 64-67, 96.—While pondering a question humans tend to look up and either to the left or to the right. Men tend to exhibit more of a preference for 1 direction than women do. The direction predominantly chosen is related to personality differences and may be related to cerebral hemisphere dominance. Many conceptions of behavior (e.g., primary and secondary processes) can be interpreted in terms of cerebral hemisphere dominance. —*E. J. Posavac.*

6028. Stanley, Gordon; Finlay, David C., & Bartlett, W. K. (U. Melbourne, Victoria, Australia) **Regions of brightness and darkness in the sequential presentation of partially overlapping straight lines.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 314-318.—2 male and 2 female undergraduates made estimates of the location of regions of brightness and darkness with respect to a reference code when 2 partially overlapping illuminated rectangles of 80x6 mm. were presented sequentially at 0- or 50-msec interstimulus interval. Stimuli were presented in a left-right or right-left order for durations of either 25 or 50 msec. under conditions of 20-, 30-, or 40-mm overlap. Results indicate that with increasing stimulus-onset-asynchrony (SOA), there was a shift of greatest brightness from the overlapped region toward the leading edge of the 2nd rectangle presented. Darkness judgments also shifted from 2 bands flanking the overlapped region at 25-msec SOA toward a single region in the area of overlap at greater SOAs. Results are discussed in terms of G. von Békésy's concept of brightness funneling. —*Journal abstract.*

AUDITION

6029. Cohen, Michael J. & Johnson, Harold J. (Bowling Green State U.) **Effects of intensity and the signal value of stimuli on the orienting and defensive responses.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 286-288.—Maximized the chances for the occurrence of both orienting and defensive responses by manipulating signal value and intensity of auditory stimuli. A 2x2 design was used generating 4 groups of 10 female undergraduates each. Intensity was manipulated by presenting 60- or 100-db tones. Signal value was manipulated by having Ss (a) make a frequency discrimination and an overt response under the signal condition, and (b) simply listen under the nonsignal condition. 2 different measures of both cephalic and digital vasomotor activity were used. Neither of the cephalic responses was sensitive to any of the experimental manipulations. The digital responses basically reflected changes in stimulus intensity. Results do not support V. Sokolov's theory with respect to cephalic responding. —*Journal abstract.*

6030. Fulgosi, Ante (Inst of Psychology, Faculty of Philosophy, Zagreb, Yugoslavia) **Informacijska vrijednost slušnih ritmova.** [Information value of auditory rhythms.] *Revija za Psihologiju*, 1970, Vol. 1(1), 11-13. 9 Ss were presented with 22 different auditory rhythms. The rhythms varied between 40-208 bpm with a constant increase of 8 bpm. Rhythms were presented in random order. Information value of this set was 4.46 bits. Amount of information transmitted was 2.3 bits (median value), a value quite similar to the amount of information transmitted by loudness and pitch. Each rhythm was presented 60 times. A separate analysis of transmitted information in the 1st and the last 15 presentations of each stimulus was made. Median values were 2.23 and 2.36 bits, respectively. On the basis of this, it is concluded that training does not affect the amount of information transmitted by these stimuli. (English abstract)—*A. Fulgosi.*

Perception

6031. Clement, Jack R. (Stanford U.) **Minimal**

perceptible differences in decay rates of aperiodic signals. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5054.

6032. Gerber, Sanford E. & Goldman, Phyllis. (U. California, Santa Barbara) **Ear preference for dichotically presented verbal stimuli as a function of report strategies.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 2), 1163-1168. —Investigated lateral asymmetries in the perception of dichotic synthetic verbal stimuli in a group of 24 normal-hearing right-handed Ss. Ss were tested under the following reporting conditions: (a) free recall, in which S reported the stimuli in any order; (b) ordered before, in which S was instructed which ear to report 1st before the presentation of stimuli; and (c) ordered after, in which S was instructed which ear to report 1st after the presentation of the stimuli. It was found that a significant right-ear preference for dichotically presented verbal stimuli existed regardless of the report strategy employed. In all 3 reporting conditions, the right ear showed a significant superiority of accuracy of response. (24 ref.)—*Journal abstract*.

6033. Jeffress, Lloyd A. & McFadden, Dennis. (U. Texas) **Differences of interaural phase and level in detection and lateralization.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 2), 1169-1179. —By employing the same narrow band of noise (50 Hz. wide, centered at 500 Hz.) as both masker and signal, and by introducing a phase-shifting network between the masking and signal channels, it is possible to control the phase angle, α , between the 2. For a given signal-to-noise ratio, controlling the phase angle controls the relative magnitudes of the interaural phase (time) difference and the interaural difference in level between the stimuli at the 2 ears. When α lies between 0 and 90° and the signal is reversed at 1 ear relative to the other, the interaural time and level differences favor the same ear. However, when α is between 90 and 180°, the ear that leads in phase or time will receive the weaker stimulus, thus putting time and intensity into opposition as cues to the lateralization of the stimulus. Data on both detection and lateralization were obtained in 2 experiments with 7 Ss, using the single-interval forced-choice procedure. Large masking-level differences were found at all values of α , and good detection was exhibited even at those values of α where time and intensity were in opposition, and where performance in lateralization was very poor. Substantial individual differences in the relative importance of time and intensity as cues were found among the Ss.—*Journal abstract*.

6034. Leshowitz, Barry & Wightman, Frederic L. (Arizona State U.) **On-frequency masking with continuous sinusoids.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 2), 1180-1190. —Examined the detectability of brief, 1000-Hz sinusoids added in phase or in quadrature to a continuous tonal masker (pedestal) of the same frequency as the signal in the presence of a continuous wide-band noise. Ss were 3 the undergraduates, serving in each of 2 experiments. The effects of signal duration, shape of the signal's energy-density spectrum, SPL of the pedestal, and noise spectrum level were investigated. For conditions in which the background noise level was low, 2 unusual phenomena were noted: (a) a complete absence of the customary trading relation between signal power and duration, and (b) an extremely shallow masking function relating signal SPL and pedestal level. These departures

from the law of temporal integration and Weber's law are consistent with a simple filter model of the ear in which it is assumed that the location of the auditory filter is altered in response to changes in the parameters of the signal and masker. A basic assumption of the model is that the location of the filter is changed in order to maximize the ratio of signal energy to masker energy at the output of the filter. For detection of a tonal signal in the presence of another sinusoid, it appears that Os can listen at frequencies far removed from that of the signal, where signal energy is as much as 40 db. down from the peak. (17 ref.)—*Journal abstract*.

6036. McFadden, Dennis & Pulliam, Kenneth A. (U. Texas) **Lateralization and detection of noise-masked tones of different durations.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 2), 1191-1194. —On different blocks of trials, 3 Ss either detected or lateralized a monaurally presented signal in a binaurally presented noise masker. 8 values of signal duration, ranging from 50-800 msec., were used for both detection and lateralization. The psychometric functions for lateralization and those for detection differed in form, but, despite this difference, both were displaced toward greater signal levels at about the same rate as signal duration decreased. That is, the difference between lateralization and detection was approximately the same for all signal durations. Signal: 400 cps. Masker: wide-band noise, 45 db. SPL/cycle. Method: single-interval forced choice.—*Journal abstract*.

6037. Taylor, M. M. & Clarke, D. P. (Defence Research Establishment Toronto, Ontario, Canada) **Monaural detection with contralateral cue (MDCC): II. Interaural delay of cue and signal.** *Journal of the Acoustical Society of America*, 1971(Apr), Vol. 49(4, Pt. 2), 1243-1253. —In a monaural detection with contralateral cue task, Ss detect a masked signal presented monaurally. A cue containing information relevant to the signal is presented to the other ear. In the present study with 2 Ss, a burst of noise was used as the signal and the same noise burst delayed or advanced by up to 2400 μ sec. as the cue. For most Ss, performance was best when the cue and signal were approximately simultaneous. When the cue led by about 800 μ sec., performance dropped sharply to levels below those obtained without the cue, recovering to the uncued level for yet longer disparities. When the signal led the cue, performance dropped smoothly as a function of timing disparity, and for signal lead greater than about 1000 μ sec., the cue had little effect on performance. It is concluded that, although the task subjectively is one of judging the apparent lateralization of the cue, the lateralization mechanism is not by itself the detecting mechanism.—*Journal abstract*.

Describes biplane center of gravity procedures which determine the vertical projection of the line of gravity in any 2 planes. The triangular center of gravity platform provides a means to study various biomechanical and physiological mechanisms operable during relatively "static" postural conditions. *Journal abstract*.

ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE & DREAMS

6043. Cartwright, Rosalind; Rechtschaffen, Allan, & Rhodes, John. (U. Illinois) **Abstracts of papers presented to the 10th annual meeting of the Association for the Psychophysiological Study of Sleep.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 293-358.—Includes abstracts of papers on the following topics: extra sleep, information processing, need for REM sleep, eye movements, ecology and phylogeny, rhythms, neurophysiology, unit activity, neurochemistry, serotonin, hormones and enzymes, dream content and recall, psychophysiology of dreams, need for dreams, methods and measurements, sex and sleep, ontogeny, insomnia and its treatment, addictive drugs, pathology, stimulus effects, response processes, and sleep under unusual conditions.

6044. Fancher, Raymond E. & Strahan, Robert F. (York U., Toronto, Ontario, Canada) **Galvanic skin response and the secondary revision of dreams: A partial disconfirmation of Freud's dream theory.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3),

308-312.—Monitored the GSRs of 15 female undergraduates while they tape-recorded accounts of their dreams. After 5 min Ss were asked to rerecord accounts of the same dreams. Passages from the 1st dream accounts that were told simultaneously with the occurrence of GSRs were significantly less likely than non-GSR control passages to be omitted from the 2nd accounts. GSR and control passages were equally likely to undergo substitutions in the 2nd accounts. Results are interpreted as being in partial disagreement with Freudian dream theory, which asserts that 1st-account passages that arouse anxiety are more likely than emotionally "indifferent" passages to undergo changes in the 2nd dream accounts.—*Journal abstract*.

6045. Hobson, J. Allan. (Massachusetts Mental Health Center, Boston, Mass.) **Sleep: Physiologic aspects.** *New England Journal of Medicine*, 1969(Dec), Vol. 281(24), 1343-1345.—Reviews sleep cycle stages and comments on current theories regarding the mechanism and function of sleep. Results of investigations recording localization of control mechanisms appear to agree on the pontine brainstem, however, findings are inconclusive regarding the actual function served by brainstem cells during the sleep cycle. Experiments in man support the theory that neural excitability regulation might be connected to the desynchronized phase of the sleep cycle. The theory that information processing is facilitated by desynchronized sleep is currently being tested. Clinical implications involved in control or suppression of desynchronized sleep (i.e., control of nocturnal asthma and anginal attacks) are discussed. (15 ref.)—B. A. Stanton.

6046. Krippner, Stanley & Hughes, William. (Maimonides Medical Center, Brooklyn, N.Y.) **Dreams and human potential.** *Journal of Humanistic Psychology*, 1970(Spr), Vol. 10(1), 1-20. Dreaming is an active, integrating, creative event, not compensatory or reactive. Whatever instinctoid pressures and traumatic or wish materials are reflected in dreams "combine with the evolutionary developmental, programming, data processing, problem-solving, and even paranormal aspects of an event which becomes an integrated whole." Contemporary interest in states of altered consciousness bodes well for all fields endeavoring to produce "full-blown human beings." (59 ref.)—P. Swartz.

HYPNOSIS & SUGGESTIBILITY

6047. Arnold, Jay. (Valdosta State Coll.) **Effects of hypnosis on the learning of two selected motor skills.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 1-6.—60 male college students (45 highly traceable and 15 nontraceable) served as Ss in an effort to determine whether posthypnotic suggestion of a positive involving nature, or positive involving suggestion without hypnosis could be used to improve the learning of a fine and a gross motor skill, e.g., mirror tracing and ball bouncing, respectively. A 2nd problem investigated was whether individuals at the 2 ends of the traceability scale were affected differently by positive involving suggestion in the learning of the 2 motor skills utilized in this study. Results indicate no significant differences at the .05 level for either of these 2 problems. *Journal abstract*.

British Columbia, Vancouver, Canada) **Autonomic responses to affective visual stimulation: Sex differences.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 14-22.—Recorded physiological responses while 25 male and 25 female undergraduates viewed a random series of colored slides of homicide scenes, nude females, and ordinary objects. Responses given by both sexes to each type of slide were those generally considered to be part of an orienting response—increased skin conductance, cardiac deceleration, and digital vasoconstriction. In addition, stimulus presentation was accompanied by cephalic vasoconstriction and by a sharp reduction in eyeblink rate. Females had higher tonic heart rates but lower levels of electrodermal activity than did the males. There were no significant sex differences in the overall magnitude of cardiac deceleration and vasomotor responses elicited. However, the males gave larger initial electrodermal responses than the females. In addition, the cephalic vasomotor response given by the males was less complex (monophasic constriction) than that given by the females. There were several sex differences in the type of slide eliciting the largest response. For the males, the largest cardiac response was elicited by the homicide slides, while the largest electrodermal and vasomotor responses were elicited by the nude slides. The opposite was true of the females. (16 ref.)—*Journal abstract*.

(Catholic U. of America) **External vs self-produced determinants of fear reaction after shock threat.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 30-36.—Studied changes in fear level immediately after the threat of shock. Heart rate and skin conductance indices of fear were monitored while 80 female undergraduates awaited a single shock expected at the end of a specified time interval. 20 Ss were assigned to each of the following groups: (a) a threatened group which watched an accurate clock, (b) a threatened group which had no clock, and (c) a threatened group which watched a clock deliberately altered to run slow. 20 nonthreatened Ss in a control group watched an accurate clock. Results indicate that fear increased with the passage of time, in accordance with external time cues provided by the clock, terminating beyond the level produced by the initial threat instructions. However, only if Ss received external time cues indicating the imminence of shock, did emotionality increase. In the no-clock group, fear dropped to base-line level after threat, and remained there. The nonthreatened control group showed no increase in emotionality over time.—*Journal abstract*.

EEG activity and number of detections in different phases of monitoring were registered. No significant differences in detections were found in different postures. EEG activity was markedly different in standing from the EEG activity in the other 2 postures. These results are contrary to the expectations which could be derived from activation theory of vigilance. (English abstract)—*A. Fulgosi*.

6077. MacKay, Donald G. (U. California, Los Angeles) **How does language familiarity influence stuttering under delayed auditory feedback? Perceptual & Motor Skills**, 1970(Apr), Vol. 30(2), 655-669.—Attempted to determine how language familiarity affects stuttering under delayed auditory feedback (DAF). In 1 condition DAF interference was compared in 21 German-English bilingual students speaking their more and less familiar languages. A language familiarity effect was found: the bilinguals spoke faster and stuttered less under DAF when speaking their more familiar language. This effect was independent of both delay time and language spoken. Moreover, the slower rate in the less familiar language could not explain the language familiarity effect since instructing Ss to slow down their rate of speech decreased rather than increased their stuttering. A 2nd condition showed that the language familiarity effect was not due to paying more attention to feedback in the less familiar language. Rather, practice or experience in producing the motor organization of speech seemed to underlie the effect of language familiarity. (25 ref.)—*Journal abstract*.

6078. Mewhort, D. J., Thio, Harriet, & Birkenmayer, A. C. (Queen's U., Kingston, Ontario, Canada) **Processing capacity and switching attention in dichotic listening.** *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 111-129.—Describes 4 experiments with 82

undergraduates which indicate that (a) switching attention in a dichotic listening task requires processing capacity, and (b) increasing encoding difficulty reduces the amount of switching in a free recall dichotic listening task. Results are discussed in terms of a limited capacity processor model which contends that switching attention, encoding, and sustaining material all require processing capacity and that the S's strategy regarding switching attention is determined by the capacity available after capacity requirements for encoding are met. 6081. Shulman, Harvey G., Greenberg, Seth N., & Martin, JonPaul. (Human Performance Center, Columbus, O.) **Intertask delay as a parameter of perceptual deficit in divided attention.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 439-440.—Examined the perceptual deficit reported by H. Shulman and S. Greenberg as a function of the delay between presentation of a memory task and a perceptual task. Ss were 36 undergraduates. The speed of perceptual processing decreased as a function of memory load, and this effect was present at delays of 2, 5, and 8 sec. Results support the conclusion that 2 distinct information-processing functions (information storage and perceptual processing) will behave in a nonindependent fashion when one or the other makes heavy demands on processing capacity.—*Journal abstract*.

6082. Soward, John B. & Moss, Stanley M. (U. Massachusetts) **The effects of value ratio shifts on item processing in a visual search task.** *Journal of General Psychology*, 1971(Apr), Vol. 84(2), 291-302.—Ss were differentially rewarded for correctly reporting briefly exposed stimuli that were designated as high or low valued. 3 groups of 24 undergraduates each were originally trained under different ratios of payoff associated with the high and low valued stimuli (2:1, 4:1, or 8:1). 8 Ss from each group were then shifted to the remaining 2 value ratios with 8 Ss (controls) staying at the value ratio at which they were originally trained. Ss increased their response rates relative to the control condition when there was a large upshift (2:1/4:1) and depressed their responding with a large downshift (8:1/4:1). The data also suggest that a downshift produced an increase in accuracy whereas an upshift produced a decrease in accuracy. These results were interpreted as supporting a mutual interference hypothesis of item processing in short-term memory.

6083. Šverko, Branimir. (Inst. of Psychology, Faculty of Philosophy, Zagreb, Yugoslavia) **Vjerojatnost detekcije rijetkih slušnih signala u funkciji veličine intervala od prethodne reakcije.** [Probability of signal detection in an auditory vigilance task as a function of interval duration since the last response.] *Revija za Psihologiju*, 1970, Vol. 1(1), 23-25.—In investigations of the relationship between the intersignal interval and the probability of detection, the intersignal interval is usually defined as (a) the time from the last signal (regardless of

whether it was detected or not), or (b) the time since the last detection. Both investigation methods neglect, however, the possible effect of false responses on the probability of detection. In this study false responses were included in computing intersignal intervals. Data from an auditory vigilance study were grouped according to the time which elapsed between the last response (regardless of whether it was a false alarm or a correct detection) and the appearance of a new signal. The results show that the probability of detection is low immediately after the response and low after long intervals. The probability of detection was highest after intervals of medium duration. MOTOR PERFORMANCE

6085. Barnsley, Roger H. & Rabinovitch, M. Sam. (McGill U., Montreal, Quebec, Canada) **Handedness: Proficiency versus stated preference.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 343-362. Reports an investigation of performance factors of developed hand preference. Measurements taken from both the preferred and nonpreferred hands of 50 17.3-34.1 yr old males and 50 17.9-27.4 yr old females yielded scores on 61 dependent variables from 32 tests. Factor analyses of the scores produced 9 interpretable factors of hand performance. Each factor was common to male and female and to preferred-nonpreferred performance. However, preferred hand performance was superior on almost all tasks. Results indicate that questionnaires of stated hand preference cannot adequately represent the range of handedness or degree of differential manual proficiency. It is suggested that preferred hand performance is characterized by "automatization" of the skills involved in hand performance. (30 ref.)—*Journal abstract*.

Scores on the eye-hand coordination subtest of the Marianne Frostig Developmental Test of Visual Perception for 360 3-39 yr old males and females confirmed the Frostig standardization scores through age 7.—*Journal abstract*.

6087. Carron, Albert V. (U. Saskatchewan Saskatoon, Canada) **Intra-task reliability and specificity of individual consistency.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 583-587. Reanalyzed the data of D. Q. Martin in order to examine the relationship of consistency of motor response among the component responses of a single motor task 120 15-18 yr old high school Ss were tested on a special task the rho. A single trial on this motor task can be logically separated into 3 component motor responses: RT, a short circular movement, and a short linear movement. Results indicate that consistency of motor response was moderately reliable within the response components but tended to be response-component specific. Further, both the reliability and specificity of motor-response con-

sistency were independent of the size of the mean performance scores. (15 ref.)—*Journal abstract.*

6088. Danev, S. G., et al. (Netherlands Inst. for Preventive Medicine, TNO, Leiden) **Psychophysiological assessment of information load.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Jan), Vol. 26(1), 23-39.—Assessed the different demands imposed on individuals by a sensorimotor task under 2 levels of information load. The measured psychophysical parameters were heart and respiratory rates and their variability. The performance was measured in terms of RT, misses and mistakes and performance on a secondary task. 6 male students responded to 2 conditions: punching the correct button when either of 2 lights appeared and, similarly, when 8 lights appeared. The secondary task was a simple addition problem to be solved before the button was pressed. Analysis of variance indicated that RTs, mistakes and misses and performance on the secondary task discriminated best between the 2 conditions. Different Ss reacted differently to the 2 conditions in their cardiac and respiratory functioning. The relation between RT and various phases of the cardiac and respiratory cycle and the length of time the button was pressed in response to signals was significantly related to the information load.—A. J. Ter Keurst.

6089. Semjén, András. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest, Hungary) **Célmozgások programjának szakaszos szerveződése: A Mozgás "akcióküszöbe," irányának és amplitúdójának programozása.** [Phase organization of amplitude-regulated movements: The "action threshold" of movement; the programming of its direction and amplitude.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(3), 355-369.—In a discrete step-tracking situation 2 different types of time intervals were employed between the successive movements of the target. The long interval enabled the S to terminate his correctional move before the target was moved again. When the short interval (100-140 msec.) was employed, the 2nd move of the target always took place before the overt motor response was started; consequently it may have played the role of a signal for modifying the original motor task. Based on the motor response amplitude-indices and RT data, the following conclusions are drawn: (a) latency time of amplitude-regulated movements is more affected by the uncertainty pertaining to the direction of the movement to be performed than by the amplitude; movements with different amplitudes but identical directions have, to a certain extent, the same value with regard to preparation for that movement; (b) uncertainty associated with the amplitude of the movement to be performed involves an increase in the spread of movement amplitudes; it may be assumed that movements with different amplitudes, if they can be performed in a given direction, do not constitute entirely discreet response categories; (c) in the course of central organization in amplitude regulated movements, the psychological refractory period does not prevail in such a form as might be deduced from the single-channel mechanism hypothesis; and (d) on the basis of the foregoing it may be assumed that a certain phase structure prevails in the organization of amplitude-regulated movements, i.e., the primary decision bears on the direction of the movement to be made; programming of amplitude in the movement to be performed takes place at a later stage of the process. REACTION TIME

6090. Hinrichs, James V. & Craft, John L. (U. Iowa) **Verbal expectancy and probability in two-choice reaction time.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 367-371.—Examined the probability effect (PE) in 2-choice RT studies. 40 male and 40 female undergraduates were assigned to 1 of 5 experimental groups varying the levels of probability differences between the more and less frequent stimuli: 50-50, 60-40, 70-30, 80-20, and 90-10. In 1 condition, Ss were required to predict the stimulus presentations. A regression analysis of the prediction condition showed 3 factors to be significant contributors to the PE: (a) the conditional PE which is observed when Ss' predictions are taken into account, (b) the difference in RT to correct and incorrect stimulus anticipations, and (c) the relative proportion of correct and incorrect stimulus anticipations.—*Journal abstract.*

6091. Kohfeld, David L. (Southern Illinois U., Edwardsville) **Simple reaction time as a function of stimulus intensity in decibels of light and sound.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 251-257.—Compared simple auditory and simple visual RTs on the same scale by presenting psychophysically equivalent response signals. In Exp. I with 60 soldiers, mean RT for both auditory and visual signals at 90 and 60 db. was the same; for the 30-db comparison, RT was longer for the visual than for the auditory signal. Exp. II with 3 naive and 1 experienced S, indicates that the light-tone difference at 30 db. was attributable to latency differences between reception at photopic and scotopic visual levels. The common assumption that auditory RT is shorter than visual RT is reconsidered. (17 ref.)—*Journal abstract.*

6092. Wallace, Richard J. (U. Oregon) **S-R compatibility and the idea of a response code.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 354-360.—Conducted 2 experiments with 6 male and 6 female undergraduates each in which Ss pressed 1 of 2 keys placed to their left or right when 1 of 2 stimuli were presented. A stimulus could occur on the left or right, or above or below a fixation point. Ss performed with their hands uncrossed or crossed. Compatibility effects were found to hold between the position of the stimulus and that of the response key whether or not the hands were crossed. Thus the effects did not depend on the relation between a stimulus and a particular motor output. It was hypothesized that the positions of both the stimulus and the responding hand were related to a spatial code, and the outcome of a comparison between their representations in this code was responsible for the differences in compatibility. Results of Exp. II suggest that there were both facilitation and interference in the compatible and incompatible situations, respectively.—*Journal abstract.*

6093. Williams, John D. (Ohio State U., Human Performance Center) **Memory ensemble selection in human information processing.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 231-238.—Investigated human information processing in a choice RT task requiring 15 male and 15 female undergraduates to use memory information organized in subsets or ensembles which were characterized by color. Results indicate that S performed 2 serial memory-search operations in order to classify a stimulus as a member of the memory set: (a) selected the appropriate ensemble for processing by conducting a serial, exhaustive scan of

a memory set of ensemble-defining colors; and (b) serially scanned the selected ensemble. Equations were derived reflecting stimulus-encoding and response-decoding time, ensemble-selection rate, and the rate of scanning of the selected ensemble. Results demonstrate that S could reduce his processing load by scanning a single memory ensemble instead of his entire memory set.—*Journal abstract.*

6100. Melnick, Merrill J. (U. Utah) **Effects of overlearning on the retention of a gross motor skill.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 60-69.—4 groups of 20 male freshmen each practiced the skill of balancing on a stabilometer to a learning criterion and then received 0, 50, 100, or 200% overlearning practice. $\frac{1}{2}$ of the Ss in each of the groups returned for retention testing after 1 wk. while the other $\frac{1}{2}$ returned after 1 mo. Absolute and relative retention scores were calculated

for each S and then statistically analyzed. Results show that immediate recall of the skill following the 2 retention intervals was facilitated by overlearning, 50% overlearning proving, in most instances, as effective as 100 and 200%. Relative retention scores were not significantly better after 1 wk. and 1 mo. for those Ss receiving 50 and 100% overlearning; however, the Ss who received 200% overlearning had significantly better retention than the Ss who had 0% overlearning following the 1-mo retention interval. Further analysis of retention scores reveals that differential warm-up decrement effects may have partly accounted for the retentive superiority of the groups that received "extra practice."—*Journal abstract.*

Michigan) **A novel discrete gross motor learning task: Modifications of the Bachman ladder.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 78-82.—Proposes a modification of the Bachman ladder climb task which eliminates the speed vs. height trade-off by scoring the task as a discrete task. Performance curves for 20 female undergraduates and 18 male undergraduate and graduate students are presented, and the advantages of the modified task are discussed.—*Journal abstract.*

Conditioning

6102. Goodman, Alan S. (Florida State U.) **The effects of instructions, response cost, and reinforcement availability discriminative stimulus on human operant behavior.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5603.

6103. Lanning, Alan W. & Yaremko, R. M. (Coll. of DuPage) **Resistance to extinction in GSR conditioning: Effects of postpeak CR training and preextinction rest.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 433-435.—4 groups of 10 undergraduates each received paired tone-shock classical GSR conditioning trials, differing in the number of training trials beyond peak CR amplitude (2 or 16), and the presence or absence of a 5-min preextinction rest interval. 4 additional groups of 10 Ss each received unpaired tones and shocks matched in number to Ss in the experimental groups. Results indicate that conditioning groups without rest displayed an inverse relationship between the number of postpeak training trials and resistance to extinction, while the introduction of rest reversed this relationship. It is concluded that recent studies of postpeak GSR conditioning produced results which are modifiable when appropriate inhibition-reducing operations are employed and that these operations will produce strong resistance to extinction.—*Journal abstract.*

6104. Lloyd, Andree J. & Leibrecht, Bruce C. (Headquarters U.S. Army Medical Research Lab., Ft. Knox, Ky.) **Conditioning of a single motor unit.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 391-395.—Injected 17-18-24 yr. old males with bipolar fine-wire electrodes into the tibialis anterior muscle. A start light indicated the onset of a trial. If Ss activated a single motor unit, a correct light appeared. With no additional feedback, Ss learned to isolate and control a single motor unit within 500 trials and demonstrated significant improvement during a relearning series.—*Journal abstract.*

6105. Ohman, Arne. (U. Uppsala, Sweden) *Inter-*

action between instruction-induced expectancy and strength of unconditioned stimulus in GSR conditioning. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 384-390.—Administered 12 long interstimulus interval GSR conditioning trials to 50 draftees. Ss were then instructed about increases or decreases in the intensity of the shock that was used as the UCS. The actual shock was changed in strength in the same or opposite direction. For a control group, the shock was not mentioned in the instruction and was not changed. On the trial immediately following instruction, the magnitude of the CS and pre-UCS responses were found to be manipulable in an upward but not in a downward direction through the instruction. On the 2nd and 3rd trials, the pre-UCS response was largest when there was a conflict between the instruction and the actual shocks, whereas the CS response was primarily determined by shock intensity. The UCR was smallest when the instruction about changes in shock intensity was in agreement with the actual changes. Results support a preparatory set explanation of the UCR attenuation phenomena in classical conditioning of the GSR. (20 ref.)—*Journal abstract*.

6109. Trimble, Ralph W. (Brooks Air Force Base, School of Aerospace Medicine, San Antonio, Tex.) **Applications of the vicious circle paradigm to human subjects.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 23-29.—Vicious circle behavior was operationally defined as greater resistance to extinction under punishment extinction than under regular extinction, following avoidance conditioning. Using 56 and 104 18-20 yr. old female undergraduates, respectively, as Ss, 2 studies employed factorial designs involving these 2 types of extinction along with 2 levels of shock and 2 levels of similarity between the avoidance conditioning and extinction situations. Vicious circle behavior was obtained in both studies; shock level differentially influenced responding in neither study; and a condition of low similarity suppressed responding under the punishment extinction condition of Exp. II. Results suggest possible applicability of the vicious circle paradigm to humans and encourage further study of this maladaptive type of behavior. (17 ref.)—*Journal abstract*.

6110. Unikel, Irving P. & Strain, G. S. (U. Georgia) **Type of reinforcement and generality in verbal operant conditioning.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 495-500.—Randomly assigned 48 undergraduates to 1 of 3 reinforcement conditions: (a) social approval, (b) correctness, and (c) noncontingent reinforcement control. Extinction trials were conducted either by the same or a different E. 5 male graduate student Es, randomly selected from 10 available, generally were assigned 2 Ss in each of the resulting 6 conditions. The 2 types of reinforcement appeared to be equally effective with respect to effects on verbal operant

conditioning ($p < .001$), but social approval resulted in less generality than reinforcement for being correct. Ss receiving social approval exhibited significantly more rapid extinction in an altered stimulus situation with a different E ($p < .05$). Results suggest why numerous previous verbal conditioning studies which typically use social approval have failed to yield generalizable effects (17 ref.)—*Journal abstract*.

6111. Yelen, Donald R. (Washburn U.) **The acquisition and extinction of superstitious behavior.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 1-6.—In Exp. I with 26 undergraduates as Ss, an attempt was made to establish and to control superstitious verbal responses. A verbal operant conditioning task, modified by pacing the Ss' rate of responding and by delaying the appearance of the reinforcer, was used. The response measures—percentage occurrence of responses, number of reinforced responses, and postconditioning verbal reports indicated that specific superstitious responses were established. Exp. II replicated Exp. I, and also investigated the effects of shifts in reinforcement schedule on the extinction of superstitious verbal responses. 52 undergraduates were Ss. After training with a delay in reinforcement schedule, Ss in Exp. II were shifted to either a no delay in reinforcement schedule, or an extinction condition. Results indicate that the extinction condition does not affect the superstitious responses, and that the frequency of superstitious responses was reduced under the no delay in reinforcement schedule.—*Journal abstract*.

Verbal Learning

6112. Cramer, Phebe. (Williams Coll.) **Can semantic generalization occur without CS presentation?** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 380-383.—Conducted 2 experiments with 40 and 32 undergraduates. Ss' responses to a semantic generalization test list were compared following a training list in which the critical stimuli (CSs) were or were not presented. Results indicate that responses to the test list were determined by the relationship of test-list to training-list CS words, and not by some extraneous characteristics of the test words themselves.—*Journal abstract*.

6115. Paul, Hadassah. (Hofstra U.) **Ratio of correct to incorrect alternatives: A test of the frequency hypothesis of verbal discrimination learning.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 285-286.—Reports 2 studies with 50 and 36 Ss in which the manipulated frequency ratios of correct (C) to incorrect (I) alternatives of a verbal discrimination (VD) pair were either 4:1, 2:1, or 1:1. Rate of acquisition of a VD list was predicted to vary directly with the size of C:I ratio, in accordance with the frequency hypothesis of VD learning. Results are generally consistent with the theory.—*Journal abstract*.

6116. Rogers, Pamela W. (U. Arizona) **Effect of alliteration on acquisition and retention of mean-**

ingful verbal material. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 671-675. Studied the effect of degree of alliteration on verbal learning using 4 groups of 90 undergraduates each. 4 degrees of alliteration and 3 retention intervals were used. Alliteration alone had no effect on retention. With the addition of an attentional cue (capitalization or instructions), alliteration had a significant facilitative effect on retention.—*Journal abstract*.

6117. Rowe, Edward J. & Paivio, Allan. (U. Western Ontario, London, Canada) Word frequency and imagery effects in verbal discrimination learning. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 319-326.—Varied frequency (F) and imagery (I) values of words factorially over 2 levels in 4 verbal discrimination learning experiments with a total of 56 undergraduates. High-I pairs were significantly easier than Low-I pairs under both mixed- and unmixed-list conditions, with the effect being restricted to High-F words. Variation in F produced a significant effect in 2 experiments, the difference being specific to Low-I pairs in a mixed-list design. Investigation of learning strategies show that imagery was reported as the preferred strategy for High-I pairs, while repetition occurred more frequently for Low-I pairs. A postlearning test of associative recall produced fewer errors for High-I than for Low-I pairs when both were High-F. Results are discussed in relation to the frequency theory of verbal discrimination. (19 ref.)—*Journal abstract*.

6118. Uleman, James S. & VandenBos, Gary R. (Michigan State U.) Generalized verbal conditioning: Some effects of the meaning and delay of reinforcement on awareness and conditioning. *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 49-56.—Reported 2 Taffel-type verbal conditioning experiments. In Exp. I with 218 undergraduates, Ss were told that reinforcements were equivalent to more power in a future small group task. In Exp. II with 2 groups of 45 Ss each, reinforcements were interpreted as a measure of verbal ability. Exp. I, but not Exp. II, produced awareness and conditioning. In Exp. I, short reinforcement delay yielded more awareness and conditioning, apparently through controlling Ss' attention. Minor effects of S sex and of E were also found. Virtually any reinforcement or signal interpretation is possible with this paradigm. Its potential in studying cognitive and motivational factors in verbal conditioning is noted. Verbal Paired Associate Learning

6120. Arbuckle, Tannis Y. (Sir George Williams U., Montreal, Quebec, Canada) Mediational instruction, stage of practice, presentation rate, and retrieval cue in paired-associate learning. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 396-402.

Examined the effect of instructions to form mediators on paired-associate (PA) learning for 2 presentation rates, 2 stages of practice, and 2 sets of noun-noun pairs—abstract (A)-concrete (C) noun pairs with the A noun as the test cue (A-C/A) and the reverse C-A/C pairs. 120 male and female undergraduates learned 2 mixed lists of A-C/A and C-A/C pairs under 6 combinations of rate and instructions. Trials to learn

were significantly reduced by mediational instructions, the slow rate, the 2nd list, and the C-A/C pairs. Mediational instructions affected both stages of practice similarly, although the effect was less marked with the 2nd list. Instructions reduced the difference between C-A/C and A-C/A pairs while the efficiency of the fast rate relative to the slow one increased from the 1st to the 2nd list. Data are discussed in terms of the hypothesized role of mediators in PA learning. (21 ref.)—*Journal abstract*.

6121. Calfee, Robert C. & Anderson, Rita. (Stanford U., School of Education) Presentation rate effects in paired-associate learning. *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 239-245. Combined presentation rate, trigram meaningfulness, stimulus-response pairing, and intralist similarity in a factorial study of the effect of rate on paired-associate learning of digit and trigram combinations. 480 undergraduates served as Ss. Rate had a significant effect on criterion performance when trigrams were used as stimuli with digit responses, more so for high intralist similarity materials. Optimal intervals fell in the range of 2-4 sec. Rate was not a significant variable for digit-trigram pairs. Efficiency of association and stimulus differentiation appears to depend on presentation rate, but response integration does not. (20 ref.)—*Journal abstract*.

6126. Soho, Robert L. (Loyola U., Chicago, Ill.) Stimulus selection among triaxially stimuli. *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 289-291. Used triaxially stimuli composed of 3 levels of meaningfulness in a paired-associate task. Following acquisition, 70 undergraduates were given a transfer task in which a fraction of the original stimulus appeared. Results indicate that stimulus selection is a function of the relative meaningfulness of stimuli within triaxialities. Selection tendencies and pattern learning are discussed. *Journal abstract*.

6127. Yarmey, A. Daniel & Ure, Gail. (U. Guelph, Ontario, Canada) Incidental learning, noun imagery-concreteness and direction of associations in paired-associate learning. *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 91-102. Examined the effect of imagery-concreteness pairs in incidental learning. In Exp. I with 96 undergraduates, intentional learning was superior to incidental learning. Recall of concrete-concrete noun pairs was significantly better than recall of all other pairs, while concrete-abstract and abstract-concrete nouns did not differ from each other but did differ from abstract-abstract recall. In Exp. II with 64 Ss, instructions to use imagery during the orientation task resulted in similar performance for

incidental and intentional learning Ss. Concreteness yielded a greater effect on the stimulus side than on the response side of pairs, particularly for stimulus-response recall. Associative directionality had no reliable effects in either experiment. Results are discussed in terms of A. Paivio's conceptual peg hypothesis and 2-process theory of verbal and imaginal memory (French summary) (17 ref.).—*Journal abstract.*

6132. Dooling, D. James & Lachman, Roy. (Kent State U.) Effects of comprehension on retention of prose. *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 216-222.—Manipulated comprehension of metaphorical passages by prior presentation or non-presentation of a short title reflecting their theme or main idea. Word order was varied independently by presenting the material in 1 of 3 forms: (a) random words, (b) random phrases, and (c) prose. In Exp. I with 120 undergraduates, both variables facilitated free recall performance with no interactions. In Exp. II with 240 undergraduates, a paced binary-recognition test followed the same input conditions. Ss who understood the theme performed better only with those words prejudged as thematically relevant, indicating a true semantic effect and a process of matching test words to an internally stored thematic surrogate. Results suggest that an abstract representation of a passage's central meaning is used as a mnemonic device in the retention of prose.—*Journal abstract.*

6134. Fox, Paul W. & Dahl, Peter R. (U. Minnesota) Aided retrieval of previously unrecalled information. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 349-353. Trained 100 undergraduates to a 30% criterion on a paired-associate (PA) list, tested for PA recall, and then tested again for the unretrieved items under special probe and prompting conditions. Storage of response information was demonstrated by prompted recall of new retrievals considerably in excess of that

expected on the basis of normative free association probabilities. The availability of associative information was revealed by Ss' ability to match previously unretrieved PA responses with the appropriate stimuli. Results support the view that Ss' store of information is not exhausted by an unprompted test of PA recall. In addition, the original PA stimuli were found to play no functional role in the prompted generation of new retrievals. Several processes by which prompts may work to cue retrieval are discussed.—*Journal abstract.*

6135. Frost, Nancy. (Center for Perceptual & Cognitive Research, Eugene, Ore.) Clustering by visual shape in the free recall of pictorial stimuli. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 409-413.—Hypothesized that if visual memory (for pictures) is searched during recall of picture names, then recall should be organized according to visual similarities. Stimuli were 32 drawings of common objects, drawn so that they clearly fell into 4 shape categories. Stimuli were randomly presented to 45 undergraduates who then gave free recall of the objects' names. Recall was scored for clustering according to the shape categories. 15 additional Ss were presented the written names of the objects, and their free recall, scored according to the shape categories, was used as a control. Experimental Ss clustered by shape during free recall, while control Ss did not. No evidence was found to differentiate the performance of Ss who were led to expect a verbal task (recognition of names) from that of Ss who expected a visual task (recognition of drawings).—*Journal abstract.*

6136. Hintzman, Douglas L. & Block, Richard A. (U. Oregon) Repetition and memory: Evidence for a multiple-trace hypothesis. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 297-306.—Tested 2 hypotheses concerning the effect of frequency on memory: (a) that repetition increments the cumulative strength of a single memory trace; and (b) that repetition results in multiple traces, each identifiable by its "time tag." Results from 3 experiments with a total of 112 paid volunteers support the multiple-trace hypothesis. When words were presented twice in a single list, subsequent judgments of serial position showed that the effects of the 2 repetitions could be discriminated in memory. A combined frequency judgment and list-discrimination task demonstrated that Ss could differentiate between recent and remote frequencies of the same word. It is concluded that the internal representation of frequency is one in which the identities of individual repetitions are preserved. Implications for the frequency theory of verbal discrimination learning are discussed. (22 ref.)—*Journal abstract.*

6137. Johnson, Ronald E. (Purdue U.) Differential meaningfulness and isolation effects. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 376-379.—Studied the influence of differential meaningfulness in producing isolation effects in a 3×3 factorial experiment. Background lists of low, medium, or high meaningfulness (m) contained a single embedded syllable of either low, medium, or high m. 243 undergraduates received 15 serial learning trials on 1 of the 9 types of lists. Recall of the embedded syllable was best when the background lists were of higher m. Performances on isolates of higher m were superior to isolates of lower m, but genuine isolation effects occurred only for isolates of low m.—*Journal abstract.*

6138. Kendler, Howard H. & Ward, James W. (U. California, Santa Barbara) Memory loss following

discrimination of conceptually related material. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 435-436.—Investigated the memory loss of a specific word when it is learned as an instance of a conceptual category. 108 undergraduates were trained to discriminate between 2 sets of conceptually related words under conditions of different stimulus-exposure and response-delay periods as well as different amounts of practice. Results suggest the locus of the memory loss was in the strength of the association between an individual word and its conceptual category response, and not in either the exposure or delay periods.—*Journal abstract*.

6139. Keppel, Geoffrey; Bonge, Dennis; Strand, Bonnie Z., & Parker, Janat. (U. California, Berkeley) **Direct and indirect interference in the recall of paired associates.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 414-422.—Reports 3 experiments with a total of 312 undergraduates which studied interference effects operating on forward and backward associations. Evidence was found for direct and indirect interference in 4 transfer paradigms (A-B, A-D; A-B, C-B; A-B, D-A; and A-B, B-C). The failure of previous studies to find indirect interference is attributed to the use of a high degree of original learning. The difficulty of the principle of associative symmetry to accommodate certain outcomes of the 3 experiments is discussed. (20 ref.)—*Journal abstract*.

6140. Peterson, Margaret J. (Indiana U.) **Imagery and the grammatical classification of cues.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 307-313.—Varied the imagery ratings and grammatical classification of words in word pairs to study the effects upon cued and free recall. Words were selected that function as nouns only, as nouns and noun modifiers without change of form, and as adjectives only. The basis of imagery classification (ratings of the pairs, of the nominal words, or of the adjectival words) also was investigated. The imagery ratings of the words was the only variable that significantly affected recall in 36 undergraduates. The recall of the whole pair was higher when conditionalized upon high-imagery than upon low-imagery words in all analyses of both free and cued recall.—*Journal abstract*.

6141. Shiffrin, Richard M. (Indiana U.) **Forgetting: Trace erosion or retrieval failure?** *Science*, 1970(Jun), Vol. 168(3939), 1601-1603.—Describes 3 experiments with 111 undergraduates in which a series of lists of random words was presented. Following each list, the S attempted to recall the words of the list prior to the list just presented. It was found that recall probability for a given word depended on the length of the list in which it was embedded, not on the length of the list intervening between presentation and test. Results indicate that forgetting is a failure in the memory search during retrieval rather than a degradation of the memory trace occurring between presentation and test.—*Journal abstract*.

6142. Sussman, Harvey M. & Smith, Karl U. (U. Wisconsin) **Sensory-feedback modes as determinants of learning and memory.** *Journal of Educational Research*, 1970(Oct), Vol. 64(2), 64-66.—Investigated the role of sensory feedback factors in determining learning and memory in 12 Ss, 4 different modes of movement control of sensory input on memory of stimulus patterns were used: (a) visual tracking of the pattern without manual control, (b) parallel pursuit tracking of the

pattern with a hand-controlled visual cursor, (c) opposed pursuit tracking of the stimulus pattern with a hand-controlled visual cursor, and (d) compensatory negative feedback tracking in which S observed only the error of tracking the stimulus pattern. Results indicate that mode of sensory feedback control of sensed input of stimulus patterns during learning determined immediate memory, and that memory was superior for modes of feedback control in which the pattern of stimulation and of movement could be compared. It is concluded that the processes of active and passive learning and their role in determining learning and memory are specifiable and predictable as variable forms of movement-controlled sensory feedback.—*Journal abstract*.

6143. Walker, Howard J. (State University Coll. New York, Oswego) **Interaction of imagery, associative overlap, and category membership in multitrail free recall.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 333-339.—Hypothesized that the relationship between word imagery (I) and free recall would be diminished in lists containing verbally based internal structure. 3 groups of 30 undergraduates each received 3 different word lists for 4 free recall trials. Each list contained an equal number of high- and low-I words. In 1 list, no attempt was made to build in any interword relationships. The 2nd list contained pairs of associatively related words, while the 3rd list contained word pairs which were associatively related and shared membership in common conceptual categories. As predicted, the advantage of high-I over low-I words in amount recalled decreased as the degree of list structure increased. (16 ref.)—*Journal abstract*.

6144. Winograd, Eugene; Conn, Charles P., & Rand, Joyce. (Emory U.) **Superiority of complete presentation to single-item presentation in recall of sequentially organized material.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 223-230.—Reports 2 experiments on free recall in which the method of complete presentation was compared with the typical single-item (1 word at a time) presentation procedure. Total time was held constant. In Exp. I with 112 undergraduates, there was no difference between methods for either unrelated word or categorized lists. In Exp. II with 40 Ss, lists varying in approximation to English were presented, and higher recall was obtained with complete presentation for contextually constrained lists. Results are discussed in terms of facilitation of the usage of optimal units (chunks) with the method of complete presentation. (16 ref.)—*Journal abstract*.

6145. Yaroush, Rita; Sullivan, Michael J., & Ekstrand, Bruce R. (U. Colorado) **Effect of sleep on memory: II. Differential effect of the first and second half of the night.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 361-366. Tested 3 groups of 16 undergraduates for recall after a 4-hr retention interval of a paired-associate list. In Group A, the retention interval was defined over the 1st 4 hr. of a night's sleep; for Group B over the last 4 hr. of the night, and Group C learned in the daytime with the retention interval defined over a 4-hr period of wakefulness. Results show Group A to be consistently superior to the other 2 conditions on several measures of recall. Groups B and C did not differ on any of the measures. Results are discussed with respect to various conceptions of long-term forgetting and a modified consolidation interpretation is proposed to account for these and other effects of sleep on memory.—*Journal abstract*.

Short Term & Immediate Memory

6147 Berlá, Edward P. (U. Cincinnati) **Inter- and intra-list interference and repetition effects in short-term memory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5652-5653.

6148 Deutsch, Diana. (U. California, Center for Human Information Processing, San Diego) **Tones and numbers: Specificity of interference in immediate memory.** *Science*, 1970(Jun), Vol. 168(3939), 1604-1605. Reports that recognition of the pitch of a tone was severely disrupted by the incorporation of 6 other tones during a 5-sec retention interval, even though the intervening tones could be ignored. However, the requirement for Ss to recall 6 numbers spoken at equal loudness during the identical retention interval produced only a minimum decrement in the same pitch recognition task. Further, the requirement to remember the tone produced no decrement in recall of the numbers. It is concluded that immediate memory for pitch is subject to a large interference effect which is highly specific in nature and which is not due to some limitation in general short-term memory capacity or to a distraction of attention.—*Journal abstract*.

6149 Elliott, Maxwell C., Hoyenga, Katharine B., & Hoyenga, Kermit T. (Western Illinois U.) **Cueing and scoring procedures in STM.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 437-438.—Compared 2 different methods for cueing for immediate recall in short-term memory (STM). A 7-item list of CVCs was given to 54 undergraduates, and the retention of the list item was tested. It was found that the use of a cueing method that introduced appreciable delay between presentation and recall could result in misleading conclusions. The scoring method of J. Wright (see PA, Vol. 42:313) was compared with the common all-or-none scoring method. The 2 different analyses implied the same conclusions in all cases.—*Journal abstract*.

6151 Kirsner, Kim & Craik, Fergus I. (Drayton House, Medical Research Council Developmental Psychology Unit, London, England) **Naming and decision processes in short-term recognition memory.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 149-157.—Presented serially a list of 8 words to 16 students at a 1-sec rate, followed after 2 sec. by a test word for (a) item recognition, or (b) renaming as rapidly as possible. It was argued that subtracting naming latency (NL) from decision latency (DL) yielded a relatively pure measure of comparison times in memory. The "corrected DL" values showed strong recency effects. Recency effects were also present in the NL measures, demonstrating a short-term priming effect in word naming. Manipulating input modality yielded faster NL and corrected DL values when the presentation series and test word were both given auditorily. Since this facilitation was present over all serial positions, it is concluded that both naming and decision processes were speeded by the presence of relatively long-lasting auditory information in memory. Implica-

tions for models of recognition memory are discussed. (18 ref.) *Journal abstract*.

6152 Levy, C. Michael & Jowaisas, Dennis. (U. Florida) **Short-term memory: Storage interference or storage decay?** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 189-195.—168 undergraduates were given 42 trials in each of which a different consonant trigram or 3-digit number was visually presented for 1 sec. and followed by an interpolated shadowing task. The interpolated materials were either similar or dissimilar to the target items and were presented for 3-18 sec. Recall was inversely related to the similarity and the number of the interpolated items. A stimulated recall procedure required Ss to provide 1, 2, or all 3 elements of the target item to differentiate empirically between storage interference and storage decay. Results suggest a greater influence of interference than trace decay processes in storage. (17 ref.)—*Journal abstract*.

6153 Scheirer, C. James. (State U. New York, Binghamton) **Effect of cueing, modality, and effective contiguous time on response latency in short-term memory.** *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 429-432.—Examined the effect of various manipulations, which are generally considered to be associated either with storage or with retrieval aspects of memory on the recall of verbal materials. The dependent variables were error frequency and latency of correct responses. Each item of a pair of words was presented to 96 undergraduates either auditorily or visually, for an effective duration of either 1 or 4 sec. Ss were required to recall either the stimulus or the response item of the pair and the required item was either cued (the nonrequired item was presented at time of recall) or not cued. It was found that, in general, storage variables had an effect only upon error frequency, while the retrieval variable, cueing, had an effect only on latency.—*Journal abstract*.

6155 Zvonarevic, Mladen & Spitek, Vlasta. (Inst. of Psychology, Faculty of Philosophy, Zagreb, Yugoslavia) **Neposredno pamćenje kao indikator interesa.** [Immediate memory as an indicator of interests.] *Revija za Psihologiju*, 1970, Vol. 1(1), 33-35.—A list of 32 book titles was presented twice to the same 74 Ss. The 1st time the titles were read to Ss and they were requested to memorize as many titles as they could. 1 wk. later the same list was presented as a classical test of interest. On this occasion Ss were asked to select the titles from the list according to their interests. The results of the 1st and the 2nd occasion were compared. On the basis of the differences, it is concluded that memory could be a better indicator of interests than the results obtained by classical tests of interests.—*English summary*.

6158. Holzman, Philip S. & Rousey, Clyde. (U. Chicago) Disinhibition of communicated thought: Generality and role of cognitive style. *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 263-274. —Studied the effects on thought functioning in 80 male and 80 female adults of vocal occlusion by white noise masking (WNM). The interruption of vocal feedback did not change performance on either a cognitive task (a reading test) or on a visual-motor test (digit substitution) when no vocal activity was involved. For men there was a slight but significant performance decrement on the reading test when oral reading was involved. For all Ss, WNM produced an increase in impulse-related themes and a decrease in defensive themes on the TAT. Findings suggest that (a) hearing oneself as one speaks is necessary for modulating impulse and affect and for smooth reality testing in general; and (b) for men, the disinhibition effects of WNM tend to occur in the setting of a leveling cognitive style. Results are discussed in terms of their relevance to defensive organization and the need for vocal feedback in maintaining the stability of defense. (38 ref.)—*Journal abstract*.

Problem Solving

6161. Crombag, H. F. (State U., Leiden, Netherlands) Probleemoplossen: Protokollen en programma's. [Problem solving: Protocols and programs.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Nov), Vol. 25(10), 650-663.—Describes the thought process in problem solving to proceed as a stream of thought determined by a perceptual set, consisting of a linear sequence of "operational transformations" about the problem data. The protocol of problem solving is defined as the written report of the "thinking aloud" during the introspective process. The program of problem solving is defined as the report of the protocols about a specific problem. As illustrated by a block-design problem, there is frequently a substantial difference between the protocol of an S who has had prior knowledge of the design of a similar problem and that of an S who is naive in solving such a problem. It is hypothesized that basing the program of procedures in problem solving on various previous protocols is an unnecessary requirement. The ruling by a skilled jurist about the ownership of a stolen article is used to illustrate the concept that a problem solver who knows the program can produce a protocol which is isomorphic with that program.—A. J. Ter Keursi.

6162. Khatena, Joe. (Marshall U.) A second study training college adults to think creatively with words. *Psychological Reports*, 1971(Apr), Vol. 28(2), 385-386.—Randomly assigned 105 undergraduates to 4 treatment groups. Ss were exposed to 5 creative thinking strategies for 240 min. or twice the training time used in an earlier study. The longer training significantly increased the probability of the occurrence of original

responses as measured by 2 tests of originality. Results support the use of training procedures and increased training time.—*Journal abstract*.

6163. Krause, W. (Humboldt U., Berlin, E. Germany) Untersuchungen zur Komponentenanalyse in einfachen Problemlösungsprozessen: Der Einfluss von Hypothesen, Strategien und Gedächtniskomponenten auf die Lösungsfindung in nichtkomplexen Problemsituationen. [Component analysis examinations of simple problem-solving processes: Effects of hypotheses, strategies, and memory components for the solving of noncomplex-problem situations.] *Zeitschrift für Psychologie*, 1970, Vol. 177(3-4), 199-249.—Treated the prediction of events of periodic symbol sequences as a simple problem-solving process. Partial components of the process, e.g., hypothesis and strategy formations, are analyzed. For the partial components, a formal representation is given. It is shown that, with the aid of mathematical representations and under certain conditions, it is possible to make a prediction at each step for any desired starting-symbol sequences. It is further shown that the use of determined strategies is a relevant method for the patient, at least in parts. (4 p. ref.)—P. von Toal.

6164. Maspfuhl, B. & Metz, A. (Humboldt U., Berlin, E. Germany) Veränderungen im Elektromyogramm bei der Beurteilung perzeptiver Muster unterschiedlicher Schwierigkeit. [Changes in the electromyogram in diagnosing perceptive patterns of differentiated difficulty.] *Zeitschrift für Psychologie*, 1970, Vol. 177(3-4), 286-309. Attempts to determine the psychophysical activity level in view of its importance in solving problems of industrial psychology. With increasing industrial automatization, bodily physical efforts are more and more superseded by superintending and controlling activities. The resulting psychic processes of an emotional character can be determined by their physiological reaction courses. The registration of the biological activity of muscles, appearing with every reflex reaction, is recorded via an EMG. An explanation of the physiological concomitant phenomena of psychic processes is attempted, and the experimental method used is explained. It is demonstrated that the variability in the physiological parameter is much higher than the time of recognition of the task on hand. It is assumed that the variability in the time of recognition is dependent on the variability of the time of activity. (37 ref.)—P. von Toal.

6165. Ollendick, Thomas; Balta, David, & Zigler, Edward. (Purdue U.) Expectancy of success and the probability learning of retarded children. *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 275-281.—Tested 23 male and 22 female institutionalized retarded children who had previously experienced either a success, failure, or control precondition on a probability learning task designed to assess expectancy of success. Ss were matched for CA, MA, IQ, and length of institutionalization. The following measures were also collected as S variables: Locus-of-Control Scale, Cottage Rating Scales, school rating, and Reading and Arithmetic subscales from the Metropolitan Achievement Test. The preconditions were found to have many of the expected effects on the cognitive strategies employed in the learning task. Ss in the failure condition showed the greatest avoidance of failure (maximizing strategy), while Ss in the success condition tended to show more success striving (lose-shift strategy). Males were found to exhibit more failure-avoiding strategies than females. The

overall pattern of results is interpreted as providing support for the hypothesis that a low expectancy of success in retarded children can be modified. (19 ref.)—*Journal abstract.*

6166. Sydow, H. (Humboldt U., Berlin, E. Germany) **Zur metrischen Erfassung von subjektiven Problemzuständen und zu deren Veränderung im Denkprozess: I.** [Metric comprehension of subjective problem conditions and their changes in the thinking process. I.] *Zeitschrift für Psychologie*, 1970, Vol. 177(3-4), 145-198.—Attempts to perform a problem-solving process in such a way that a comprehensive presentation of (a) the interaction of memory perceptions, (b) components of concept formations, and (c) complex recognition processes is possible, permitting at the same time the making of associations for a larger class of problems and problem-solving processes. Methodological considerations concerning the chosen level of description are stated. Terms for the various aspects of the thinking process are suggested, based on the work of Duncker and on present situation programs. A survey is made of experimental-psychology work, which was carried out with the "Tower of Hanoi" at the Institute of Psychology at the Humboldt University of East Berlin, and a model is described for the processing of the problem-solving process.—*P. von Tost.*

6171. Taplin, John E. (U. Adelaide, South Australia) **Effect of initial instance on attribute identification of concepts using a selection procedure.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 177-181. Conducted an experiment with 104 undergraduates to investigate the effect of the type of instance presented at the start of an attribute-identification problem in which a selection procedure was employed. Concepts involving 1 of 4 conceptual rules were identified from an initial positive or initial negative instance. Results indicate that, for all conceptual rules, there was a significant tendency to select instances of the same type as the initial instance. The informativeness of the initial instance was seen to be a good predictor of performance for conjunction and conditional, but not for inclusive disjunction and biconditional. The order of increasing difficulty of rules was found to interact with the nature of the initial instance.—*Journal abstract.*

6172. White, Raymond M., Richards, Diana L., & Reynolds, Richard. (Miami U.) **Number of pretraining**

problems and type of instructions in concept identification. *Psychological Reports*, 1971(Apr), Vol. 28(2), 643-649.—Gave 0, 1, 2, or 3 pretraining problems to 40 male and 40 female undergraduates prior to administration of an experimental concept problem. Instructions were either simply descriptive of the stimulus population and response requirements or elaborated such that S was told the rule defining problem solution and given a sample problem. Analyses show a significant inverse relationship between number of pretraining problems and trials to criterion. Presolution data indicate that Ss changed problem-solving strategies both as a function of number of pretraining problems and type of instructions. Implications for theories of concept learning are discussed.—*Journal abstract.*

The times required to make such decisions were (a) shorter with greater separation of the 2 letters in the alphabet, (b) shorter for letter pairs in proper order than for reversed pairs, and (c) more affected by order of the pair at small than at large separations. Decision times were also systematically related to position of the letters in the alphabet, times generally increasing from the beginning to the end of the alphabet.—*Journal abstract.*

6185. Narikashvili, S. P. (Inst. of Physiology, Tbilisi, USSR) **Vzaimodeistvie mezhdu koroi bol'shikh polushariĭ i nekotorymi podkorkovymi obrazovaniyami.** [Interaction between the cerebral cortex and some subcortical structures.] *Sovremennye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 128-162.—Presents a short account of research conducted in the Laboratory of Cortico-Subcortical Interrelationships for 1958-1965: (a) corticopetal influences from the brainstem reticular formation, thalamic nuclei, and caudate nucleus; (b) corti-

cifugal influences from thalamic nuclei, brainstem reticular formation, and caudate nucleus; (c) interaction between corticopetal and corticofugal influences; (d) relationships between ascending and descending influences of the reticular formation; and (e) projection of various afferent systems in the mesencephalic reticular formation. It was shown that corticopetal influences, ascending from the caudate nucleus, specific and nonspecific thalamic nuclei, and reticular formation, have a considerable effect on cortical neurons, facilitating their excitatory and inhibitory activity. Interaction of these ascending influences at the cortical level affects (a) the intensity of the response activity of the cortical neurons, and (b) the level of excitatory rhythmic assimilation, the regular emergence of excitatory rhythms, the rhythm of periodic oscillation of cortical responses, and the greater or lesser synchronization of activity of the cortical neurons. The ways in which these influences are mediated were investigated through stimulation of various subcortical structures. Conversely, the cerebral cortex exerts a constant facilitative and inhibitory influence on these structures through direct connections and indirectly through the reticular formation. The cerebral cortex participates in establishing and maintaining ascending activation. (English summary) (3 p. ref.)—I. D. London.

6187. Zavodskaya, I. S. & Kucherenko, R. P. (Inst. of Experimental Medicine, Moscow, USSR) **Strukturnye i funktsional'nye izmeneniya v medial'noi zone perednego hipotalamusa pri nanesenii zhlivotnym chrezvychainogo razdrazheniya i vvedenii doka.** [Structural and functional changes in the medial zone of the anterior hypothalamus of animals under extraordinary stimulation and the administration of dopa.] *Doklady Akademii Nauk SSSR*, 1971, Vol. 197(3), 732-733.—White rats were immobilized and subjected for 3 hr. to 7-V, 50-Hz electric pulses of 10-msec duration by way of electrodes implanted under the skin of the forepaws. Ss were then sacrificed and the preoptic region of the anterior hypothalamus examined under an electron microscope. Numerous degenerative changes in the ultrastructure of the neurons were observed. The mitochondria, Golgi apparatus, endoplasmic reticle, synaptic endings, nuclear membranes, and the nucleolus showed breaks, vacuolation, lysis, and other signs of disintegration. Some neurons showed focal points of disintegration and the formation of numerous lysosomes. In addition, noradrenaline content of the region studied dropped from .67 to .10 umg/gm. If, however, injections of 300 mg/kg of dopa were administered to the Ss 1 hr. before treatment, none of the degenerative changes could be observed and the noradrenaline content was normal.—L. Zusne.

LESIONS

6189. Bregvadze, I. A. (Inst. of Physiology, Tbilisi,

USSR) *Izucheniye khoda pryamykh afferentnykh putei zritel'nogo analizatora lokal'nym povrezhdeniem setchatki glaza.* [Study of the course of the direct afferent pathways of the visual analyzer by local lesion of the retina of the eye.] *Sovremennye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 309-314.—By local lesion of the retina (area of the lesion: .75 mm.²) of 21 white rats, it was possible to trace afferent connections with not only different layers of the visual cortex, but also the lateral geniculate body, thalamic nuclei, and the anterior corpora quadrigemina. Unilateral lesion of the ventral and dorsal parts of the retina displayed a similar extent of fiber degeneration within the visual cortex of both hemispheres; similarly for the visual tract. The character of degeneration of the direct centripetal nervous pathways, when different regions of the retina were destroyed, was attributed to the weak development of the visual analyzer in white rats whose retina is homogeneous in structure and is composed of only rods. (English summary)—*J. D. London.*

6190. Pavlov, B. V. (Pavlov Inst. of Physiology, Leningrad, USSR) *Izmeneniya v vysshel' nervnoi deyatel'nosti sobak pri simpaticheskoi denervatsii nadpocheknikov.* [Changes in higher nervous activity of dogs in sympathetic denervation of the adrenals.] In E. N. Speranskii (Ed.), "Tsepuve neurogornonal'nye reaktsii i simpato-adrenalovaya sistema" (See PA, Vol. 43:373) 141-146.—18 dogs with different typological traits were used to study the character of the changes in CR activity (salivation), UCRs, and general behavior after partial and complete desympathization of the adrenals by removal of the abdominal sympathetic chains and bilateral section of the splanchnic nerves. The phasic changes in higher nervous activity (depression of CR activity replaced after 10-30 days or more by a prolonged period of its exaltation) did not display a direct connection with the typological traits of the Ss. These data and those pertaining to the catecholamine content in the blood, following sympathetic denervation of the adrenal cortex, confirm the presence of adaptive-trophic influences upon the cerebrum. (19 ref.)—*J. D. London.*

Brain Lesions

6191. Bachrach, Henry. (U. Pennsylvania) *Effects of endbrain lesions on visual discrimination learning in pigeons.* *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 730.—Investigated the roles of the hyperstriatum and an accessory hyperstriatum in visual discrimination (VD) learning by training 12 adult male pigeons to 90% criterion for 50 trials on 2 consecutive days to make pattern, intensity, and color discriminations. Ss were then divided into 4 surgical groups (unilateral and bilateral lesions for each area) and retested. Results suggest that deficits in VD were more a function of the extent of the lesion rather than its locus. It also appears that the magnitude of the deficit was, in part, a function of difficulty in original learning and inherent problem difficulty rather than the specific type of problem.—*P. Hertzberg.*

6192. Carlson, Neil R. & Norman, Robert J. (U. Massachusetts) *Enhanced go, no-go single-lever alternation of mice with septal lesions.* *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 508-512.—Trained 11 normal male HS mice and 9 male HS mice with septal lesions in a go, no-go

discrete-trial alternation task with a single retractable lever presented for 9 sec., and withdrawn for 10 sec. Responses on odd-numbered trials resulted in lever retraction and food reinforcement, whereas responses on even-numbered trials resulted in neither food nor retraction of the lever. Lesioned Ss learned the task faster than normals, responding on more reinforced trials and fewer nonreinforced trials. Results are incompatible with the hypothesis that the septum is involved in response inhibition. It is suggested that the septal lesions produced an enhanced cue value for food reward.—*Journal abstract.*

6193. Fog, Rasmus; Randrup, A., & Pakkenberg, H. (Set. Hans Hosp., Psychopharmacological Lab., Copenhagen, Denmark) *Lesions in corpus striatum and cortex of rat brains and the effect on pharmacologically induced stereotyped, aggressive and cataleptic behaviour.* *Psychopharmacologia*, 1970, Vol. 18(4), 346-356.—Large bilateral lesions affecting 30-90% of the corpus striatum inhibited stereotyped behavior in 58 white male Wistar rats injected subcutaneously with amphetamine, but did not prevent rage reactions induced by injection of an MAO inhibitor followed by injection of L-dopa. The stereotyped phase normally following this rage reaction was, however, absent in the operated Ss. Small bilateral lesions in the corpus striatum (5-20%) caused a modified amphetamine stereotypy and prevented the usual cataleptic behavior produced by subcutaneous injection of a neuroleptic drug (perphenazine). Additional ablation of the overlying dorsal cortex enhanced these behavioral effects without qualitative changes. Both amphetamine and neuroleptics seem thus to mediate their behavioral effects through dopaminergic mechanisms in the corpus striatum. (32 ref.)—*Journal abstract.*

6198. Macphail, Euan M. (U. Sussex, England) **Hyperstriatal lesions in pigeons: Effects on response inhibition, behavioral contrast, and reversal learning.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 500-507.—Studied the effects of bilateral hyperstriatal lesions in 7 pigeons (*Columba livia*), in comparison with 4 sham-operated and 4 unoperated controls. Exp. I measured the effect of these lesions on performance in negative and positive components of a successive discrimination, using free-operant techniques. Compared with controls, lesioned Ss were significantly impaired in their ability to inhibit responding in negative components; however, behavioral contrast, measured in positive components, was not reduced. In Exp. II, lesioned Ss were impaired over a series of 6 reversals of a simultaneous position discrimination, but not on its acquisition. It is concluded that hyperstriatal lesions in pigeons cause a general deficit in the ability to withhold responses as a consequence of nonreward, but that this deficit is probably not the result of a reduced emotional response to nonreward.—*Journal abstract*.

6201. Pereira, Walter C., da Rocha, Tania L., & Timo-laria, Cesar. (U. São Paulo, Medical School, Brazil) **Evolução do comportamento e da atividade elétrica cortical do rato com lesões crônicas da formação reticular mesencefálica.** [Behavioral and electrographic studies on rats after chronic lesion of the midbrain reticular formation.] *Arquivos de Neuro-Psiquiatria*, 1970(Dec), Vol. 28(4), 311-323.—Subjected albino rats to either unilateral (N = 11) or bilateral (N = 7) electrolytic destruction of the midbrain reticular formation. A complete unilateral or bilateral interruption of the ascending activating system was achieved. The electrocorticographic pattern of synchronized sleep occurred in both unilaterally and bilaterally lesioned Ss as soon as the S recovered from the surgical trauma, when slow waves still predominated. Such findings support the hypothesis that activating systems other than the midbrain reticular activating system exist whose functional block during sleep furthers the synchronization of the cortical electrical activity. An increasing recovery of desynchronization and motor activity as a function of time was shown by all Ss. Recovery occurred earlier and more quickly in the S with unilateral lesions. Physiological sleep evolved with all phases by the 4th or 5th day after the lesion was made. It seems that desynchronization of the paradoxical phase of sleep does not involve any particular structure arising from and/or passing through the midbrain. (31 ref.)—*English summary*.

6203. Winocur, Gordon & Mills, John A. (U. Saskatchewan, Saskatoon, Canada) **Spontaneous activity**

in septal and hippocampal-lesioned rats. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 483-492.—Assigned 30 naive male albino Wistar rats in equal numbers to control, hippocampal, and septal groups. Ss were observed in a novel situation for 3 15-min sessions with 24 hr. between sessions, and measures taken of their sniffing, walking, and grooming rates. The most important difference occurred in the 3rd session when it was found that the type of lesion exerted control over the habituation of different responses. In walking, there was a tendency for Ss in the hippocampal and control groups to decrease their rate over time, while septal-lesioned Ss tended to increase their rate. Both septal and control groups decreased their sniffing rate, whereas the hippocampal group did not. In grooming, neither the hippocampal nor the septal group showed an increase in rate, whereas the control Ss did. Results of the septal-lesioned Ss are regarded as consistent with a conventional response-inhibition hypothesis while the data of the hippocampal group suggests a deficit in attentional mechanisms. (16 ref.)—*Journal abstract*.

Brain Hypothalamic & Hippocampal Lesions

6204. Gambaryan, L. S. (Armenian SSR Academy of Science, Erevan) **O roli palliduma i gippokampa v formirovani funktsional'noi sistemy dvigatel'nogo povedeniya.** [The role of globus pallidus and hippocampus in the establishment of the functional system of motor behavior.] *Doklady Akademii Nauk SSSR*, 1971, 196(4), 984-986.—Cats were conditioned to bar press left at the sound of a bell and to bar press right at the sound of a metronome. Reacquisition of these responses was measured after partial or total ablation of globus pallidus or of the hippocampus. Lesions in either structure had no marked effects on the motor components of the CR. The association of the CS with the right or left side, however, was severely impaired. Total destruction made it impossible to retrain the Ss to select sides, even when intensive training was conducted over a 3-mo period.—*L. Zusne*.

BRAIN STIMULATION

6205. Huston, Joseph P. (Tufts U.) **Effect of glucose on threshold of intracranial reinforcement.** *Psychopharmacologia*, 1971, Vol. 19(2), 105-113. Threshold of reinforcing hypothalamic stimulation in male Long-Evans rats was shown to increase as a result of intragastric loading of 10 cm³ of 50% glucose. Thresholds increased steadily up to between 50 and 80 min. after glucose injection before they began to decline. Intragastric water loads had no effect on thresholds. To measure thresholds of reinforcement, a new technique was used, which involved a base-line fixed-ratio schedule concurrent with CRF schedule. Increasing and decreasing the magnitude of the CRF caused the fixed-ratio postreinforcement pauses to disappear and reappear, providing a method of limits criterion for threshold of reinforcement. Of 11 Ss tested, 6 completed the experiment. (26 ref.)—*Journal abstract*.

Chemical Stimulation

6207. Levitt, Robert A. & Buerger, Peter B. (Southern Illinois U.) Interactions between cholinergic mechanisms and the salt arousal of drinking. *Learning & Motivation*, 1970(Aug), Vol. 1(3), 297-303.—77 adult male hooded rats received injections of chemicals into parts of the limbic system in combination with a subcutaneous injection of 1 or 3 ml. of a 15% salt solution. Injections of carbachol into cholinergic drinking sites increased water intake above that to salt alone. However, the increase was greater in Ss stimulated with 1 ml. of salt. Brain injections of either atropine (bilateral) or carbachol in combination with atropine (into contralateral sites) reduced water intake below that to the salt injections alone. These reductions were similar in size for both doses of salt solution.—*Journal abstract.*

6218. McIlwain, James T. & Fields, Howard L. (Brown U., Div. of Biological & Medical Sciences) Superior colliculus: Single unit responses to stimulation of visual cortex in the cat. *Science*, 1970(Dec), Vol. 170(3965), 1426-1428.—Electrical stimulation of area 18 of the cat visual cortex produced intense excitation of neurons in the superior colliculus. Excitation was followed by a period of decreased collicular responsiveness to light stimulation. These effects were seen in both directionally selective and nonselective units. The cortico-collicular projection was retinotopically organized. (17 ref.)—*Journal abstract.*

6219. Milgram, N. W., Devor, Marshall, & Sever, Alfred C. (Scarborough Coll., U. Toronto, Ontario, Canada) Spontaneous changes in behaviors induced by electrical stimulation of the lateral hypothalamus in rats. *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 491-499.—Studied changes in the behaviors induced by hypothalamic stimulation when 20 Long-Evans hooded rats were given repeated testing sessions under constant experimental conditions. Ss which only ate or drank initially, usually did both after sufficient experience. Following the initial changes, the amounts of induced feeding and drinking stabilized, but at levels which differed between electrodes. If a 2nd behavior did not emerge spontaneously, it also did not emerge when the originally dominant stimulus object was removed. Results are interpreted as indicating that hypothalamic stimulation excites functionally specific neural elements, but the function

these elements cannot be immediately inferred from the induced behaviors.—*Journal abstract.*

(Inst. of Physiology, Tbilisi, USSR) **O roli mindalevidnogo kompleksa i grushevidnoi kory v regulyatsii povedeniya zhivotnykh.** [On the role of the amygdaloid complex and pyriform complex in regulation of animal behavior.] *Sovremennye Problemy Davatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 97-127.—Cats with chronically implanted electrodes were used to study the role of the amygdaloid complex and pyriform cortex in emotional behavior. It was shown that the amygdaloid complex possessed a complex functional structure with distinct topographical organization of its functions. Even various parts of the same nucleus were functionally different. Thus, the posterior part of the basolateral complex participated primarily in the organization of defensive behavior, while its anterior part was an inhibitory substrate for alimentary behavior. Similarly for the pyriform cortex: electrical stimulation of (a) the prepyriform cortex (anterior part) led to alimentary behavior, (b) the periamygdalar cortex (middle part) to defensive behavior, and (c) the entorhinal cortex (posterior part) to inhibition of alimentary behavior. Isolated exclusion of both the amygdaloid complex and pyriform cortex caused hyperphagia and a decrease in fear and aggression. The effect was intensified with their simultaneous exclusion, indicating that they formed 1 functional system regulating both alimentary and defensive behavior. During affective behavior a burst of activity with sinusoidal waves of 35-40 cps occurred, resulting from excitation of the limbic circle, in the prepyriform cortex, and the amygdaloid basal nucleus as well as in the olfactory bulbs. (English summary) (2 p. ref.)—*J. D. London.*

6222. Ordzhonikidze, Ts. A. & Oniani, T. N. (Inst. of Physiology, Tbilisi, USSR) **O funktsional'noi lokalizatsii v mindalevidnom yadre i gipotalamuse.** [On functional localization in the amygdaloid nucleus and hypothalamus.] *Sovremennye Problemy Davatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 68-85.—Using cats with chronically implanted electrodes, different points in the amygdaloid complex and hypothalamus were stimulated and changes in behavior, as well as in spontaneous electrical activity of the neocortex and paleocortex, were noted. Characteristic of stimulation applied to the lateral hypothalamus was the appearance of chewing movements which continued after its cessation. Between the periodically repeated chewing movements Ss were very much on guard and experienced fear, to the accompaniment of emerging sinusoidal waves of high frequency and high amplitude, especially pronounced in the paleocortex. After stimulation of the lateral part of the amygdaloid complex, increased excitability through the limbic system was observed, to the accompaniment of an increase in appetite. Identical changes in behavior and spontaneous electrical activity were obtained also upon stimulation of the lateral hypothalamus. Stimulation of the basal part of the amygdaloid complex and medial hypothalamus failed to produce these reactions. The data obtained are discussed in the light of the functional differentiation

obtaining between different parts of the amygdaloid complex and hypothalamus. (English summary) (*J. D. London.*)

6223. Routtenberg, Aryeh. (Northwestern U.) **Forebrain pathways of reward in Rattus norvegicus.** *Journal of Comparative & Physiological Psychology*, 1971(May), Vol. 75(2), 269-276.—Investigated self-stimulation effects in 121 adult male albino rats using bipolar electrodes and sine-wave current. Self-stimulation loci could be separated into 2 categories: olfactory and extraolfactory. The former included the anterior olfactory nucleus, the lateral septal area, the medial forebrain bundle, and the anterior commissure, but not the diagonal band of Broca. The extraolfactory placements were in pregenual or frontal cortex, the cingulum, corpus callosum, and caudate nucleus. Silver-impregnation experiments employing the Fink-Heimer procedure revealed that this extraolfactory system originates in frontal cortex, ascends via cingulum and through corpus callosum, to descend as part of the internal capsule in the caudate nucleus. At hypothalamic levels it is part of the most medial tip of the internal capsule, interdigitating, thereby, with lateral portions of the medial forebrain bundle. It is suggested that (a) medial forebrain bundle self-stimulation may often be derivative of this extraolfactory fronto-mesencephalic pathway, and (b) inferring the site of stimulation by the electrode-tip placement only may lead to incorrect identification. 6224. T'evadze, B. G. (Inst. of Physiology, Tbilisi, USSR) **Hipokampis kh'veulis ushualo gaghizlanelis gavlenis shesakh'eb rep'lek'sur reak'tsiozbe.** [On the influence of direct hippocampal stimulation on animal reflex reactions.] *Sovremennye Problemy Davatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 86-96.—Using dogs, it was shown that electrical stimulation of the hippocampus changed the respiratory rhythm so that most often it slowed up after a bit of short-term increase. Sometimes due to hippocampal stimulation, cases of involuntary turning of the head toward the contralateral side was observed. On stimulation of the anterior part of the hippocampus, not only were the motor CRs inhibited, which were elaborated by direct action on the neocortex under the conditions of the experimental chamber but likewise those motor-alimentary reactions which were elaborated under conditions of free behavior. At the same time there was no inhibition of the act of taking the food. On stimulation of the hippocampal convolution these motor UCRs were inhibited which were elicited by stimulation of the cortical division of the motor analyzer. Extreme stimulation of the hippocampus produced epileptic convulsions lasting several min. It is suggested that hippocampal stimulation exerts an influence on the activity of both the neocortex and the brainstem. In this way, stimulation of the anterior parts of the hippocampus produces the so-called general inhibition of the CNS. (Russian & English summaries) (23 ref.)—*J. D. London.*

ELECTRICAL ACTIVITY

6225. Dzhevrisvili, T. D. (Inst. of Physiology, Tbilisi, USSR) **Medlennye potentsialy i tormozhenie neironov somatosensornoi kory u kotyat.** [Slow potentials and inhibition of somatosensory cortical neurons in kittens.] *Sovremennye Problemy Davatel'nosti i*

Stroeniya Tsentral'noi Nervnoi Sistemy, 1968(Sep), Vol. 2, 193-204.—Lightly nembutalized 1-20 day old kittens were used to study the behavior of single neurons in the somatosensory cortex in the early period of postnatal ontogenesis during paired dermal stimulation. Observations were made of the connection between inhibition of the discharges of the neuron and the slow potentials, recorded from the cortical surface. Paired electrodermal stimulation of the foreleg noticeably changed the parameters of the primary response to the 2nd electroshock: the latent period of the primary response increased by 10-40 msec.; at definite intervals (150-600 msec.) the primary response either disappeared completely or its amplitude decreased. The character of the neuronal response to the 2nd stimulus was a function of the interval between the paired electrodermal shocks and their strength until complete cessation of the discharges. Inhibition of the neuronal discharges coincided in time with the surface-negative slow potential of the primary response. Duration of the slow negative wave of the primary response and inhibition of the neuronal discharges decreased with increase in age of the S. A possible mechanism for the inhibition of neuronal activity in afferent impulsion is considered. (English summary) (35 ref.)—*I. D. London*.

6227. Furedy, John J. & Scull, John. (U. Toronto, Ontario, Canada) **Orienting-reaction theory and an increase in the human GSR following stimulus change which is unpredictable but not contrary to prediction.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 292-294.—Hypothesized that merely unpredictable stimulus change is a form of weak novelty (WN) which, according to the most plausible interpretation of orienting-reaction (OR) theory, should not produce any increase in the GSR component of the OR. 24 undergraduates were given an unpredictable series of shock and cool-air puff trials arranged so that, in addition to the WN factor, the factors of trial blocks and temporal proximity of previous stimulus (PPS) were also varied orthogonally within Ss. GSR magnitude was reliably and inversely related to both trial blocks and PPS, with no interaction between the trial blocks (habituation) and PPS (effector-fatigue) factors. The WN effect also emerged reliably, and did not interact either with the habituation or effector-fatigue effects. Implications of the WN effect for OR theory and other autonomic responses are discussed.—*Journal abstract*.

6229. Harding, Gordon & Punzo, Fred. (New Mexico State U.) **Response uncertainty and skin conductance.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 265-272.—Measured phasic and tonic skin conductance in 3 experiments with 96, 80, and 32 undergraduates. Stimuli were varied in (a) presence or absence of a response associate, (b) type of response associate (pay attention vs. make a skeletal response), and (c) amount of response uncertainty evoked. Stimuli accompanied by skeletal responses evoked larger auto-

nomic responses than did stimuli without response associates at the same level of response uncertainty, but larger autonomic responses were emitted to stimuli evoking greater response uncertainty regardless of skeletal response accompaniment. Skin conductance varied directly with amount of skeletal response uncertainty but was invariant and reliably lower over response uncertainty levels for Ss instructed to pay attention. Amount of response uncertainty determined rate of phasic skin conductance habituation, not initial response magnitude as suggested by D. E. Berlyne.—*Journal abstract*.

6231. Kadzhaya, D. V. (Inst. of Physiology, Tbilisi, USSR) **Topografiya otvetov v mezentsefalicheskoj retikulyarnoi formatsii.** [Topography of responses in the mesencephalic reticular formation.] *Sovremennye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 163-172.—40 unanesthetized curarized cats were used to study the character and topography of the responses, evoked in the mesencephalic reticular formation by different afferent stimulation (light flash, acoustic clicks, electric stimulation of muscle nerve in hindlegs and skin of contra- and ipsilateral forelegs). The response activity of various parts of the mesencephalic reticular formation was different for the same stimulation. This was especially evident in the different response amplitudes that appeared, although certain specific features could be detected in the configuration and latent periods of the responses. The parts giving rise to the greatest amplitudes, were determined for the different stimuli. While they were different they overlapped to a considerable degree. The somatosensory impulses activated most strongly the middle and posterior parts of the medioventral area of the mesencephalic reticular formation, while light activated more strongly the anterior and middle parts of the mediadorsal area. The clicks evoked responses chiefly in the ventrolateral parts of the mesencephalic reticular formation. Thus, a certain localization of the representatives of the afferent systems exists in the mesencephalic reticular formation. The most reactive to various impulses were those neurons of the reticular formation which directly mesh with the endings of the various afferents which, in their turn, terminate in various parts of the reticular formation. 6234. McCubbin, Robert J. & Katkin, Edward S. (State U. New York, Buffalo) **Magnitude of the orienting response as a function of extent and quality of stimulus change.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 182-188.—Tested the effects upon the GSR of 4 qualitatively distinct stimuli interpolated after repeated presentations of a standard stimulus. 1 of 2 standard stimuli was presented to 24

undergraduate males, and the other to another 24 Ss repeatedly until habituation was obtained; then 4 different test stimuli were presented to Ss. Habituation of the GSR occurred after initial presentations of either standard stimulus, irrespective of its quality, and a change in stimulation of any sort produced a return of the habituated orienting reflex. Differential dishabituation of the GSR to the standard stimulus following the test stimulus did not occur as a function of the degree of change in stimulation, and test stimuli did not elicit greater dishabituation of the GSR to the standard stimulus succeeding them as a function of their differential information value. Results are not entirely consistent with E. N. Sokolov's predictions. Alternative considerations are discussed.—*Journal abstract.*

In such reactions as fear, rage, and being put on the alert, there arose in the lateral parts of the amygdaloid nucleus and hypothalamus a burst of activity involving high-frequency (35-40/sec) slow potentials, whose intensity was proportional to the degree of emotional reaction. This activity could be triggered by all external stimuli producing an orienting reaction with alerting of the S as a component. After repeated stimulation for a given modality, the burst of activity extinguished along with extinction of the alerting reaction. It was possible to trigger a burst of activity in the amygdaloid nucleus and hypothalamus by stimulation of those structures of the brain (mesencephalic reticular formation, hypothalamus, etc.) whose activation produced the reaction of fear and aggression. It is suggested that the burst of activity, arising in the structures of the limbic system during free behavior, is an electrophysiological expression of emotional reactions. 6240. Unigadze, A. A. (Inst. of Physiology, Tbilisi, USSR) *Vliyaniye perifericheskikh razdrazheniy na élektricheskuyu aktivnost' glipokampa v ontogeneze.* [Influence of peripheral stimulation on hippocampal electrical activity in ontogenesis.] *Sovremennye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 223-234. Unanesthetized rabbits in the early days of postnatal life were used to study the character of electrical effects in the hippocampus in response to peripheral stimulation (flashing light; jet of air against the face; acoustic, tactile, and weak electrodermal stimuli). These responses were compared with the electrical responses of different areas of the neocortex at different stages of postnatal ontogenesis. Before the onset of Period III (15-17 days) in the morphological development of the neocortex, peripheral stimuli produced response potentials throughout the whole neocortex and in the hippocampus. The presence of similar electrical waves, in response to peripheral stimulation in the 1st 2 stages of postnatal development of the neuronal structures in the brain, appears to be due to the influence of a general subcortical locus upon the neural structures of both the neocortex and the hippocampus. After further maturation of the neural elements, peripheral stimuli bring on localized responses in the neocortex adequate to the modality of stimulation. Depending on the frequency (moderate or high) of stimulation in the 2nd period of morphological development of the cortex, the hippocampus responded, respectively, to visual stimulation with increase in amplitude of the spontaneous electrical waves or depression of electrical activity. These different effects appear to depend on activation of the desynchronizing or synchronizing systems of the brainstem reticular formation. (English summary) (21 ref.)—*I. D. London.*

6241. Wurtz, Robert H. & Goldberg, Michael E. (National Inst. of Mental Health, Lab. of Neurobiology, Bethesda, Md.) *Superior colliculus cell responses related to eye movements in awake monkeys.* *Recorded Science*, 1971(Jan), Vol. 171(3966), 82-84. Recorded single cell responses from the superior colliculus of 3 awake Rhesus monkeys trained to move their eyes. A class of cells that discharged before eye movements was found in the intermediate and deep layers of the colliculus. The response of the cells was most vigorous before saccadic eye movements within a particular range of directions. These cells had no visual receptive fields,

and visually guided eye movements were not necessary for their discharge, since they responded in total darkness before spontaneous eye movements and vestibular nystagmus.—*Journal abstract.*

Electroencephalography & Evoked Potentials

6243 Ata-Muradova, F. A. & Chuppina, L. M. (USSR Academy of Medical Sciences, Moscow) **Ekstrapervichnyi otritsatel'nyi komponent zritel'nogo potentsiala.** [Extraprimary negative component of the visual potential.] *Doklady Akademii Nauk SSSR*, 1971, Vol. 197(1), 238-241.—Evoked potentials were recorded from the visual cortex and other portions of the brain in 15 rabbits under nembutal narcosis of varying depth. The object of study was the negative potential of shortest latency in the complex of evoked response produced by photic stimulation (extraprimary negative component). Its latency is 20 msec. and its duration 10-12 msec. Since the extraprimary component of the evoked potential has the shortest latency, it is assumed that it represents excitation arriving at the cortex by the fastest route. The extraprimary component may be found also outside the visual cortex. It, thus, possesses greater generality than the more specific complex of the primary potential. It may be observed under conditions of deepest narcosis, being the last component of the visual evoked response to disappear with lethal dosages of nembutal. An analysis of the nature of the extraprimary potential in a strychninized cortex leads to the conclusion that it is a postsynaptic phenomenon. —*L. Zusne*

Science, 1970(Mar), Vol. 167(3924), 1517-1518.—In an experiment with 3 adult male Ss, it was noted that auditory potentials recorded from the vertex by a modified averaging technique were very short latencies and probably generated by brainstem structures located at a considerable distance from the recording point. The evoked waves which showed considerable detail and consistency within and across Ss. may be clinically useful in evaluating subcortical function. —*Journal abstract.*

6249 Kostandov, E. A., D'yachkova, G. I., & Timofeeva, I. V. (Central Research Inst. of Legal Psychiatry, Moscow) **Osobennosti vyzvannykh potentsialov kory na slabye zvukovye stimuly u cheloveka.** [Characteristics of cortical potentials evoked by weak auditory stimuli in man.] *Doklady Akademii Nauk SSSR*, 1971, 196(2), 471-474.—12 22-40 yr. old Ss were presented monaurally white noise stimuli of 5-15 sec. duration. Loudness thresholds were established by the method of limits, whereupon the same stimuli were presented at SPLs 3-10 db. below threshold, at threshold, and 55-70 db. above threshold. The signals were presented once every 3 sec. Ss counted and reported their number. EEGs were recorded from the vertex and the occipital area. Suprathreshold stimuli evoked a 2-phase potential whose latency and duration decreased and whose amplitude increased with increasing intensity of the stimuli. At subthreshold levels the negative phase of the potential dropped out. In 9 of the 12 Ss and in about 1/2 of the trials evoked potentials were registered when stimuli were below threshold and verbal reports indicated no perception. Since latency keeps decreasing and amplitude keeps increasing with increasing intensity of suprathreshold stimuli, it is concluded that changes in the parameters of the evoked potential are not correlated with awareness or nonawareness of the stimuli.—*L. Zusne*

6250 Leaton, R. N. & Buck, R. L. (Dartmouth Coll.) **Habituation of the arousal response in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 430-434. Implanted electrodes in the dorsal hippocampus and the anterior and posterior cortex of 5 male Holtzman albino rats. The EEG arousal response initially produced in sleeping Ss by the presentation of an auditory stimulus habituated to an asymptote after 1 or 2 stimulus presentations. The initial responsiveness to the tone did not recover over as long as 30 days without stimulation. The habituation could not be explained by excitability changes unrelated to stimulus presentations. It is concluded that nonreinforced presentations of a stimulus can produce a long-term change in the CNS.—*Journal abstract.*

6251 Webb, W. B. & Agnew, H. W. (U. Florida) **Sleep stage characteristics of long and short sleepers.** *Science*, 1970(Apr), Vol. 168(3927), 146-147. Explored the possibility of different sleep stage characteristics being associated with different sleep lengths by comparing 2 groups of high school seniors, who characteristically slept 6 1/2 hr. or less (2 males and 4 females), or who slept 8 1/2 hr. or more (4 males and 4 females), with an age matched control group (14 males), not selected on the basis of sleep length. All-night EEG was used to examine the sleep stage characteristics of these groups. Compared with controls, short sleepers showed no significant diminution in their Stage 4 (deep) or REM (dream) sleep. Long sleepers were observed to obtain significantly more REM sleep than the other groups.—*Journal abstract.*

6252 Wulff, V. J. & Mendez, C. (Masonic Medical

Research Lab., Utica, N.Y.) **Visual receptor potential: Modification by injected current in the Limulus lateral eye.** *Science*, 1970(Jun), Vol. 168(3937), 1351-1353.—Increased the latent period of the light-evoked receptor potential by hyperpolarizing currents injected directly into doubly impaled reticular cells. Indirect hyperpolarization of these cells by injection of hyperpolarizing current into the eccentric cell or other intrammatidial reticular cells either shortened or did not change the latent period. The modification of the latent period may depend upon the direction of current flow across some regions of the membrane system constituting the rhabdomere. The reduction in magnitude of the receptor potential obtained with strong hyperpolarizing currents may also depend upon the direction of current flow. Results support the conclusion that the receptor potential originates in reticular cells within the membrane system of the rhabdomere.—*Journal abstract.*

BIOCHEMISTRY

6264. Brown, Cathryn P. (U. New South Wales, Kensington, Australia) **Cholinergic activity in rats following enriched stimulation and training: Direction and duration of effects.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 408-416.—Investigated the pattern and duration of changes in cholinesterase and acetylcholinesterase activity in 2 experiments with 600 male albino Sprague-Dawley rats. Results indicate (a) a more rapid dissipation of these biochemical changes than of the improvements in behavior following both long- and short-term stimulation enrichment and formal training; (b) following short-term stimulation compared with formal training similar enzyme changes were observed, in spite of performance differences suggesting learning or memory differences between these treatments; and (c) the pattern of biochemical effects following developmental enrichment differed from that produced by short-term stimulation and training, although improved performance followed all treatments. The relevance of these findings for a postulated involvement of cholinergic activity in memory is considered. (28 ref.)—*Journal abstract.*

6265. Cartwright, G. M. (Parsons Coll.) **Use of a maze habit as a test of the specificity of memory transfer in mice.** *Journal of Biological Psychology*, 1970(Oct), Vol. 12(1), 53-60. Studied (a) whether chemical transfer of training occurred between donor and recipient animals, and (b) whether the nature of the transferred information was specific to the response learned by the donor animal. The effects on 30 male Swiss Webster mice of ip injections of brain homogenate from 36 Ss trained in a Y maze were studied. Results indicate (a) that transfer effects occurred and were response-specific, and (b) that there was a dose-effect relationship concerning the number of turns made by

any given recipient group. (29 ref.)—*Journal abstract.*

6266. Chapouthier, Georges; Spitz, Sylvie; Legrain, Danièle, & Ungerer, Arielle. (Baylor College of Medicine, Texas Medical Center, Houston) **Effect of brain extracts from mice injected into the mother on learning ability in the offspring.** *Journal of Biological Psychology*, 1970(Oct), Vol. 12(1), 49-52.—Summarizes previous work with adult mice which showed that injections of trained brain can facilitate learning. In 2 identical experiments, a total of 8 pregnant female mice were injected with conditioned brain and 10 were injected with naive brain. Shock avoidance trials with the offspring of Ss revealed no significant differences in performance. Possible reasons for this result are discussed including a consideration of the placental barrier, delay, and dilution.—*Journal abstract.*

(Veterans Administration Hosp., Sepulveda, Calif.) **Failure to transfer memory by feeding trained brains to naive chicks.** *Journal of Biological Psychology*, 1970(Oct), Vol. 12(1), 83-85.—Fed 80 naive White Leghorn cockerels homogenized brain from 80 donor chicks trained to inhibit pecking a normally attractive target, in a 1-trial learning paradigm designed to detect specific transfer of memory. Ss fed .3 or 1 trained brains and tested 24 hr. later showed neither specific nor nonspecific transfer of the learned avoidance response.—*Journal abstract.*

6268. Golub, Arnold M., Masiarz, Frank R., Villars, Trudy, & McConnell, James V. (U. Michigan, Mental Health Research Inst.) **Incubation effects in behavior induction in rats.** *Science*, 1970(Apr), Vol. 168(3929), 392-394.—Reports experiments with 17 60-90 day old male Sprague-Dawley rats in which incubation (rest) periods interposed during donor training regimens significantly enhanced the "memory transfer" effect reported by some investigators. When extracts from the brains of donor Ss given interpolated rest during acquisition training were injected into recipient Ss, statistically reliable and experimentally reproducible "memory transfer" effects were found.—*Journal abstract.*

6269. Lundquist, Frank. (U. Copenhagen, Denmark) **Influence of ethanol on carbohydrate metabolism: A review.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 1-12.—Reviews the effects of ethanol on carbohydrate metabolism, based on the following circumstances: (a) different concentrations of alcohol have different effects on metabolic processes, (b) different nutritional states result in different metabolic responses, (c) alcohol influence on metabolism differs in different species, and (d) duration of alcohol treatment influences the effect on carbohydrate metabolism. The concentration ratio of reduced to oxidized nicotinamide-adenine dinucleotide (NADH₂:NAD) in the liver is increased when alcohol is ingested. The concentration of adenosine phosphate (AMP, adenylic acid) has been found to be changed both in vivo and in vitro. In well fed organisms, ethanol causes a slight and transient increase in blood glucose. In starved organisms, the blood glucose concentration is maintained by gluconeogenesis. It is concluded that ethanol metabolism, by increasing NADH₂ and adenosine phosphate, affects glycolysis and gluconeogenesis. The effect varies with species, nutritional state, dose, and duration of treatment. (35 ref.)—A. Farjaglia.

(Williams Coll.) **Effects of food deprivation on spontaneous activity and blood glucose.** *Psychological Reports*, 1971(Apr), Vol. 26(2), 463-469.—Food-deprived 100 Sprague-Dawley female albino rats in Exp. I for 0-4 days in a wheel or stabilimeter. Activity increased with deprivation for the wheel groups only, whereas blood glucose decreased in both conditions but significantly more for the wheel groups. Glucose was more highly related to weight than activity. In Exp. II, 40 Ss were deprived in the wheels but prevented from running just prior to blood analysis. No short-term effect was observed. Glucose changes were the same as found in Exp. I. A possible relationship between glucose and activity is discussed.—*Journal abstract.*

6272. Truitt, Edward B. (Battelle Memorial Inst., Columbus Lab., O.) **Ethanol-induced release of acetaldehyde from blood and its effect on the determination of acetaldehyde.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 1-12. Data measured by gas chromatographic analysis show that blood precipitation is required for release of acetaldehyde when ethanol is added to whole blood in vitro. Occasional traces of acetaldehyde were produced when ethanol was added to nonprecipitated blood samples or to plasma from slightly hemolyzed bloods. The amount of acetaldehyde formed is linearly proportional to the logarithm of the amount of ethanol added in vitro to blood with both the gas chromatographic and spectrophotometric methods. No significant amounts of acetaldehyde were developed in the colorimetric method of Stoltz (29 ref.)—S. R. Diamond.

Drug Effects—Human

6276. Coulter, Joe D., Lester, Boyd K., & Williams, Harold L. (U. Oklahoma, Medical Center, Oklahoma City) **Reserpine and sleep.** *Psychopharmacologia*, 1971, Vol. 19(2), 134-147.—Results encourage the view that level and turnover of serotonin are the primary mediators for reserpine-induced modifications of sleep in humans. EEG sleep patterns from 20 21-28 yr old male undergraduates were examined following single and repeated oral doses (1 mg.) of reserpine. In the single-dose study, reserpine caused increased REM and decreased slow wave (SW) sleep, effects which became statistically significant on the postmedication recovery session. These changes were accompanied by reduced frequency/min of sigma spindles (Stage 2).

and identification at short exposure (1/100, 1/50, and 1/25 sec) of TAI stimuli. DOM did not affect a simple perceptual response, judgment of line length, but did produce alterations in the identification of complex stimuli at short exposure. The changes in the perception of complex stimuli disappeared as exposure time was increased.—P. J. Federman.

Drug Effects-Animal

6287. Angel, Charles & Burkett, Mary L. (Veterans Administration Center, Biloxi, Miss.) **Effects of hydrocortisone and cycloheximide on blood-brain barrier function in the rat.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 53-58.—Reports an experiment with female albino Sprague-Dawley rats assigned to 5 treatment groups of 10-24 Ss each. Results confirm that bilateral adrenalectomy significantly alters blood-brain barrier permeability to cocaine, resulting in increased accumulation in the brain tissue of the rat. Reestablishment of integrity of the blood-brain barrier was accomplished by injection of hydrocortisone for 5 days at the rate of 20 mg/kg/day. When cycloheximide (an inhibitor of protein synthesis at the stage of peptide elongation) was administered to an adrenalectomized S, the drug increased barrier penetration by cocaine; however, pretreatment of the adrenalectomized S with hydrocortisone in the dosage mentioned above reduced the barrier breakdown associated with cycloheximide pretreatment. Pretreatment of the intact S with hydrocortisone did not significantly affect cocaine accumulation in brain tissue; however, it did prevent cycloheximide-induced penetrability of the blood-brain barrier system. (18 ref.)—*Journal summary*.

6288. Anisman, Hymie. (U. Waterloo, Ontario, Canada) **Passive-avoidance learning in mice following methamphetamine or nembital injection during inescapable exposure to shock.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 611-614.—Administered 10 inescapable 2-sec shocks to 24 hybrid C57BL and DBA mice following injection of methamphetamine, nembital, or saline 22 hr. after initial training. Ss were tested on a passive-avoidance task. This task was not acquired as readily by methamphetamine Ss as by Ss treated with nembital or saline. Results indicate that prior shock-exposure results in the acquisition of a freezing response which subsequently facilitates passive-avoidance responding.—*Journal abstract*.

6289. Appel, James B., Lovell, Richard A., & Freedman, Daniel X. (U. Chicago, Psychopharmacology Lab.) **Alterations in the behavioral effects of LSD by pretreatment with p-chlorophenylalanine and α-methyl-p-tyrosine.** *Psychopharmacologia*, 1970, Vol. 18(4), 387-406.—Maintained the bar-breeding behavior of hungary naive, male, albino Sprague-Dawley rats by a fixed-ratio schedule of food reinforcement. At 5 and 12 days after pretreatment with p-chlorophenylalanine (PCPA), a subthreshold dose (20 μg/kg) of LSD was found to disrupt this behavior. No such disruption occurred when PCPA pretreatment was followed by either a distracting external stimulus (tone) or a low dose of D-amphetamine (.3 mg/kg). Sensitivity of LSD was

apparently unaffected by pretreatment with α-methyl-p-tyrosine.—*Journal abstract*.

6290. Avivi, Amiel & Chari-Bitron, Aviva. (Israel Inst. for Biological Research, Ness-Ziona) **Estimation of low chlorpromazine concentrations by surfacing and sinking reaction of minnows (*Gambusia affinis*).** *Psychopharmacologia*, 1970, Vol. 18(4), 407-411.—Surfacing and sinking reactions of minnows (*Gambusia affinis*) allowed the determination of chlorpromazine in aqueous solutions down to concentrations of .1 μg/ml. In a given volume of solution, neither sex nor number of fish/tube had any effect on their response to the low doses. 5 tubes containing 5 Ss each were employed. A 20-fold augmentation in volume caused a 2-fold increase in sensitivity. The time elapsing, from the beginning of immersion until onset of surfacing, increased with decreasing drug concentration. Partial recovery from the drug was obtained after washing of Ss with tap water. Adaptation occurred when Ss were immersed for more than 48 hr.—*Journal abstract*.

6292. Ban, Takashi & Hojo, Masakazu. (Kyoto U., Medical School, Japan) **A comparative study of the effects of anti-Parkinson drugs on the oxotremorine-induced EEG and muscular activities.** *Psychopharmacologia*, 1971, Vol. 19(1), 1-15.—The effects of oxotremorine on the EEG and muscular activities of 10 chronically electrode implanted male rabbits and the influence of several anti-Parkinson drugs on these effects were studied simultaneously to clarify the relationships between both of the activities and the possible pathways concerned. Oxotremorine, in iv doses of 300 μg/kg, caused an increase in muscular activity for 2 1/4 hr. on average, and in the EEG arousal patterns which lasted several hours. 0.3-2 mg/kg of scopolamine antagonized muscular activity (65-85%) more than EEG activity (10-45%) induced by oxotremorine, whereas 3-8 mg/kg of trihexyphenidyl antagonized both activities to the same extent (7-73% in the former and 18-75% in the latter). On the other hand, 5-15 mg/kg of diphenhydramine markedly antagonized the muscular activity (10-75%) but had little effect on the EEG activity (3-6%). 2-5 mg/kg of orphenadrine was slightly less effective than diphenhydramine on the muscular activity, and 2-5 mg/kg of propranolol was least effective on these oxotremorine-induced activities. (26 ref.)—*Journal abstract*.

6293. Baum, Morrie. (Bishop's U., Lennoxville, Quebec, Canada) **Avoidance training in both alcohol and non-drug states increases the resistance-to-extinction of an avoidance response in rats.** *Psychopharmacologia*, 1971, Vol. 19(1), 87-90.—3 groups of 22 female hooded rats each were given avoidance training followed by extinction. 1 group received 1 acquisition session immediately followed by extinction. A 2nd received 2 acquisition sessions while in the nondrug state, followed by extinction. A 3rd group received 2 acquisition sessions, 1 while under the effects of alcohol and the 2nd under no-drug conditions, followed by extinction. The group trained under 2 drug states made significantly more responses than the other 2, while the group which received 2 training sessions

while undrugged also made more responses than the group which received a single session. Results indicate that an avoidance response trained under more than 1 drug state is more resistant to extinction than a response learned only in 1 drug state.—*Journal abstract.*

6294. Bhagat, B. (St. Louis U., Medical School) **Influence of chronic administration of nicotine on the turnover and metabolism of noradrenaline in the rat brain.** *Psychopharmacologia*, 1970, Vol. 18(4), 325-332.—Chronic administration of nicotine (.5 mg/kg, subcutaneously, 3-5 times/day for 6 wk.) accelerated the rate of disappearance of intraventricularly administered ^3H -noradrenaline from rat brain. This was associated with normal levels of ^3H -normetanephrine suggesting an increase in intraneuronal deamination. The rate constant of amine decline in male Holtzman rats chronically treated with nicotine was significantly greater than that of controls, while the steady state level of brain noradrenaline was about equal in both groups of Ss. Amphetamine, reserpine, acetylcholine, histamine, pheniprazine, pargyline, and nicotine affected the catecholamine levels in the rat brain treated with nicotine to the same degree as they did in the controls. It is concluded that chronic administration of nicotine may increase noradrenaline turnover in the brain and possibly increase the deamination of this amine. (21 ref.)—*Journal abstract.*

6295. Byrne, John E. (U. California, Berkeley) **Locomotor activity responses in juvenile sockeye salmon, *Oncorhynchus nerka*, to melatonin and serotonin.** *Canadian Journal of Zoology*, 1970(Nov), Vol. 48(6), 1425-1427.—Intraperitoneal injections of melatonin, serotonin, or saline were given to juvenile salmon and their behavior was measured in a circular swimming chamber maintained at 12 hr. of light, 12 hr. of dark, 10° C, and no food. Behavior on Days 1-3 was used to establish the individual basal activity level; on Days 4-6 Ss received an injection; and Days 7-9 were postinjection test days. Locomotor activity of the melatonin-treated group decreased during the light phase while the serotonin-treated group showed an increase in activity only during the dark phase of the cycle. 3 possible explanations are offered to account for these changes in behavior.—*J. M. Roberts.*

6296. Castellano, Claudio. (National Council of Research, Lab. of Psychobiology & Psychopharmacology, Rome, Italy) **Lysergic acid diethylamide, amphetamine and chlorpromazine on water maze discrimination in mice.** *Psychopharmacologia*, 1971, Vol. 19(1), 16-25.—The effects of a psychodysleptic (LSD), a psychoanaleptic (amphetamine), and a psycholeptic (chlorpromazine) were evaluated in the performance of 24 mice previously trained in a Y water maze, following 2 procedures: light procedure, responding to a type of innate behavior, and to a "learning without errors," and dark procedure, corresponding to a type of acquired behavior. The disrupting effect of LSD and chlorpromazine was much more marked in the dark than in the light procedure, so that results can be interpreted as a return to an innate behavior pattern. LSD caused the reappearance of a "coming and going" pattern of behavior normally observed only during the pretraining sessions. With chlorpromazine a deconditioning effect limited to the dark procedure was evident at low doses, while at the highest dose immobilization at the starting point in both

procedures was observed. (16 ref.)—*Journal abstract.*

6297. Despopoulos, Agamemnon. (U. New Mexico, Medical School) **Antihemolytic actions of tricyclic tranquilizers: Structural correlations.** *Biochemical Pharmacology*, 1970(Nov), Vol. 19(11), 2907-2914.—Examined 31 phenothiazines for their capacity to protect red blood cells of the S against hypo-osmotic hemolysis. 1 male mongrel dog was used as a blood donor for experiments in which phenothiazines were compared for potency. Additional experiments were performed with blood from at least 3 other dogs, after confirming that sensitivity to phenothiazines was equivalent to earlier experiments. Incubation of erythrocytes in buffered saline (135 mOsmoles/l.) resulted in 40-50% hemolysis. Addition of phenothiazines to this system generally reduced hemolysis. The 50% effective dose (ED_{50}) was determined for each compound. Protection against hemolysis was related to molecular structural features. Imipramine and desmethylinipramine also had anti-hemolytic activity, but the response was maximal at the smallest dose used and did not change with larger doses. In several experiments, phenothiazines were preincubated with compounds which might be constituents of the red cell membrane. Binding could not be observed between phenothiazines and lecithin or cholesterol. Extensive binding to bovine albumin was demonstrated. (17 ref.)—*Journal abstract.*

6298. Dixit, K. S., Dhasmana, K. M., Saxena, R. C., & Kohli, R. P. (King George's Medical Coll., Lucknow, India) **Antagonism of intracerebrally induced nicotinic convulsions in mice: A method for measuring the central antinicotinic activity of CNS acting agents.** *Psychopharmacologia*, 1971, Vol. 19(1), 67-72.—Intracerebral administration of nicotine in mice produced convulsions without any deaths in doses which were significantly lower than the parenteral doses. Ss were 120 male and female albino mice and 20 controls. The drug seemed to act on central nicotinic receptors. The antagonism of central nicotinic convulsions was thus employed for the measurement of the central antinicotinic activity of various CNS acting agents. Chlorisondamine was found to be the most potent, and next in order were atropine and chlorpromazine. It is suggested that the method forms a simple test for evaluating the central antinicotinic activity of various CNS acting agents.—*Journal abstract.*

6299. Everett, G. M., & Borcharding, J. W. (Abbott Lab., General Pharmacology Dept., North Chicago, Ill.) **L-dopa: Effect on concentrations of dopamine, norepinephrine, and serotonin in brains of mice.** *Science*, 1970(May), Vol. 168(3933), 849-850. Reports an experiment in which large doses of L-dopa given to white male mice produced marked increases in brain dopamine, no change in norepinephrine, and a reduction in serotonin. This reduction apparently resulted from a release or displacement, or both, of serotonin from its storage sites. *Journal abstract.*

6300. Fibiger, Hans C. (Princeton U.) **A biphasic action of pilocarpine on behavioral arousal in the rat.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5019.

6301. Freed, Earl X. (Veterans Administration Hosp., Alcohol Research Lab., Lyons, N.J.) **Alcohol and conflict: Role of drug-dependent learning in the rat.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol.

32(1-A), 13-28.—Studied the effects of alcohol on experimentally induced approach-avoidance conflict in 40 Charles River male rats. Ss engaged in schedule-induced consumption of either alcohol or water. 3 phases of the experiment were differentiated: (a) approach training in which Ss ran down a spatial alley for food; (b) conflict when food was available at the end of the alley but with simultaneous shock; and (c) when shock was turned off after the conflict criterion was attained to assay if Ss resolved the conflict. Alcohol did not influence approach measures, but significantly affected the development of conflict. Groups whose intake had been both water and alcohol failed to transfer learning, suggesting drug dependence. 33 Ss resolved conflict. Results of the test phase fail to support previous studies documenting the role of alcohol as a mitigator of conflict behavior. Under only 1 condition, i.e., consistently alcohol-treated Ss exposed to conflict, was the performance of Ss under drugged condition superior to that of nondrugged. (38 ref.)—*A. Farfaglia.*

6302. Freund, Gerhard. (U. Florida) Impairment of shock avoidance learning after long-term alcohol ingestion in mice. *Science*, 1970(Jun), Vol. 168(3939), 1599-1601.—Chronic alcohol consumption impaired the learning of a 2-way shuttle box avoidance task in 14 female mice (c-57 B1/6j) 10-14 days after the discontinuation of ethanol in the diet. 28 controls received laboratory chow ad libitum or were pair-fed with the alcohol-consuming Ss by diets containing isocaloric amounts of sucrose. The performance of the 2 control groups was indistinguishable from each other, and only the ethanol-consuming mice performed poorly. It is concluded that alcohol consumption per se and not a nutritional deficiency was responsible for the impairment of learning. (18 ref.)—*Journal abstract.*

6303. Gibbins, R. J., Kalant, H., LeBlanc, A. E., & Clark, J. W. (U. Toronto, Ontario, Canada) The effects of chronic administration of ethanol on startle thresholds in rats. *Psychopharmacologia*, 1971, Vol. 19(2), 95-104.—Measured the thresholds for startle responses to electric shock in 24 adult male Wistar rats given ethanol daily in doses rising from 3.7 gm/kg over a 30-day period, and in controls receiving equicaloric doses of sucrose. Tests made 23, 36, or 47 hr. after ethanol (i.e., during partial or complete ethanol withdrawal) gave threshold values significantly lower than those obtained with sucrose-treated controls. The difference became greater after longer ethanol treatment and larger doses. However, when threshold measurements were made under the acute influence of ethanol in the experimental group, the mean values were virtually equal to those of the controls. This normalization, by ethanol, of a disturbance produced by absence of ethanol in a chronically treated S is indicative of physical dependence. Following termination of ethanol treatment, there was a gradual return of startle thresholds almost to control values over a relatively short period, indicating that the changes underlying the hyperexcitability are readily reversible. (20 ref.)—*Journal abstract.*

6304. Hauschild, Thomas B. (USAMEDCO-MEUR, Professional Services Div., APO New York, N.Y.) Marijuana. *Military Medicine*, 1971(Feb), Vol. 136(2), 105-109.—Reviews recent studies on the effects of marijuana, especially with experience in Vietnam. Marijuana-induced psychosis when marijuana is used in small amounts is reported for those with a predisposition to mental illness, but it has been found that

acute brain syndrome is correlated with dosage and can occur in anyone. Marijuana has been found to (a) produce psychotic reaction; (b) increase the likelihood of using other drugs, especially when the supply of marijuana is exhausted; (c) result in distortions of time and space; (d) produce lethargy and apathy; and (e) reduce motivation. Thickened speech, blurred vision, poor concentration, impaired thinking and a dream-like, floating state have also been associated with marijuana use of orally administered 20 mg. No evidence has been found which supports contentions that it enhances creativity or that it solves mental or emotional problems.—*G. A. Clum.*

6305. Helfetz, Stephen A. & McMillan, D. E. (State U. New York, Downstate Medical Center, Brooklyn) Development of behavioral tolerance to morphine and methadone using the schedule-controlled behavior of the pigeon. *Psychopharmacologia*, 1971, Vol. 19(1), 40-52.—Used a multiple fixed-ratio, fixed-interval schedule of food presentation to study the development of behavioral tolerance to daily injections of equipotent doses of morphine and methadone in 6 male white Carneaux pigeons. There was evidence that tolerance was developing to the rate-decreasing effects of both drugs after a single injection. Tolerance to morphine developed more rapidly during the 1st wk. of injections than tolerance to methadone. Tolerance to the depressant effects of morphine and methadone was less complete under the fixed-ratio component of the schedule than under the fixed interval component. After repeated injections, increases in the rate of responding were observed in some Ss. These increases depended on the S, rather than on the narcotic. Thus, the development of tolerance was a function of the drug, of the individual S, and of the schedule maintaining the behavior. (21 ref.)—*Journal abstract.*

6306. Izquierdo, Iván & Izquierdo, Juan A. (Cordoba National U. Inst. of Chemical Sciences, Argentina) Effects of drugs on deep brain centers. *Annual Review of Pharmacology*, 1971, Vol. 11, 189-208.—Reviews methods employed in the study of the effects of drugs on deep brain structures. Central sites of action for amphetamine, mefenazine, imipramine, desimipramine, 3-chlorimipramine, imiprypyline, and nortryptiline including EEG studies are discussed. The effects of intraventricular catecholamines, the central site of action for peripherally injected quaternary compounds, the potassium theory in regard to the pharmacology of the hippocampus, and extrahippocampal sites of drug action are also reviewed. (243 ref.)—*F. Weinstein.*

6307. Johnson, F. N. (U. Birmingham, Medical School, England) The effects of chlorpromazine on the expression of an acquired passive avoidance response in mice. *Psychopharmacologia*, 1970, Vol. 18(4), 333-345.—F₁ hybrid mice (strains C57BL/6J × 129/Ola) given 1-trial passive avoidance training were examined 24 hr. later for retention of the acquired response. Testing was carried out with 72 Ss given either chlorpromazine or saline injections before the test session. 3 chlorpromazine doses (.5, 2, and 3.5 mg/kg) were used, and 3 injection times (10, 90, or 180 min. before testing). Chlorpromazine was found to impair expression of the acquired response, both by depressing its initial elicitation and also by apparently facilitating extinction. A 2nd experiment with 20 Ss confirmed that extinction rate was increased. A clear dosage effect was observed but injection time was not important in determining the drug's effect. Further experiments with 9

and 10 Ss, respectively, were undertaken to clarify the interpretation of the drug's action; in particular, the possibility that the effects might have been caused by a dissociation of learning between the training and test situations was examined. It is suggested that the elevated extinction rates observed during testing when Ss were given chlorpromazine represents a temporary effect resulting from the reduced stimulus control of behavior. Permanent effects of pretest drug administration were noted on the initial expression of the learned response. (24 ref.)—*Journal abstract.*

6308. Jori, A., Bianchetti, A., & Prestini, P. E. (Inst. of Pharmacological Research, Milan, Italy) **Relations between barbiturate brain levels and sleeping time in various experimental conditions.** *Biochemical Pharmacology*, 1970, Oct, Vol. 19(10), 2687-2694.—Analyzed the effect of various drugs on pentobarbital narcosis. A linear correlation was obtained between sleeping time and brain pentobarbital concentration 90 min. after treatment of female Sprague-Dawley rats with 30 mg/kg ip of pentobarbital. Pretreatment with various drugs abolished or modified this correlation. SKF-525A, DDT, and low doses of chlorpromazine act on pentobarbital sleeping time by modifying its metabolism. Amphetamine reduces pentobarbital sleeping time by a mechanism which is not of metabolic origin. With phenobarbital pretreatment there is a modification of pentobarbital sleeping time which is the result of increased metabolism and sensitivity. Chlorpromazine at high doses, as well as diazepam, affect pentobarbital sleeping time without affecting pentobarbital metabolism.—*Journal summary.*

6309. Kumar, R. (University Coll., London, England) **Extinction of fear: I. Effects of amylobarbitone and dexamphetamine given separately and in combination on fear and exploratory behaviour in rats.** *Psychopharmacologia*, 1971, Vol. 19(2), 163-187.—Passive avoidance by 145 naive hooded female rats of an environment previously associated with inescapable electric shocks, was taken as an index of the level of fear on repeated, unpunished tests. Locomotor and non-locomotor exploratory activity was also recorded during these tests. Although amylobarbitone diminished fear it did not accelerate its extinction; the amounts of locomotion were increased in both shocked and unshocked Ss and tolerance did not develop to these effects of amylobarbitone. Dexamphetamine retarded extinction, with the result that the level of fear remained high even when the drug was withheld. At the same time as maintaining the level of fear dexamphetamine also increased locomotor activity, but this was confined to "safe" areas of the apparatus. Mixtures of amylobarbitone and dexamphetamine produced greater increases in locomotor activity than did the separate drugs, and their effects on fear were intermediate. In both cases the interactions between the effects of the constituent drugs did not appear to be other than additive. The inhibitory effects of dexamphetamine on the extinction of fear were not modified by adding amylobarbitone. (31 ref.)—*Journal abstract.*

6310. Langfeldt, Thore & Ursin, Holger. (U. Oslo, Neurophysiological Inst., Norway) **Differential action of diazepam on flight and defense behavior in the cat.** *Psychopharmacologia*, 1971, Vol. 19(1), 61-66.—Studied the effect of diazepam (1 mg/kg bodyweight) on flight and defense behavior in 14 feral cats. Defense behavior was reduced while there was no reduction in the flight behavior at this dosage level. The possible

selectivity of this drug for particular limbic structures is discussed.—*Journal abstract.*

6311. Lemberger, L., Sernatinger, E., & Kuntzman, R. (National Inst. of Mental Health, Lab. of Clinical Science, Bethesda, Md.) **Effect of desmethylinipramine, iprindole and DL-erythro- α -(3,4-dichlorophenyl)- β -(1-butyl amino) propanol HCl on the metabolism of amphetamine.** *Biochemical Pharmacology*, 1970(Dec), Vol. 19(12), 3021-3028.—The ability of a compound to block norepinephrine accumulation or potentiate amphetamine action has been used in the past to evaluate antidepressant activity. Results of several experiments indicate the limitations of this approach. DL-erythro- α -(3,4-dichlorophenyl)- β -(1-butyl amino) propanol HCl (B.W. 65-54), desmethylinipramine, and iprindole, 3 compounds having antidepressant activity were administered to adult male rats. All potentiated amphetamine action, but this effect is due to inhibition of amphetamine metabolism. Iprindole, a potent antidepressant in man, and B.W. 65-54 do not affect the levels of ^3H -norepinephrine in the rat heart while desmethylinipramine does. (24 ref.)—*Journal abstract.*

6312. LeVan, H., Moos, W. S., & Mason, H. C. (Veterans Administration Hosp., Hines, Ill.) **Alteration of transferability of radiation-induced behavior by dimethyl sulfoxide in mice.** *Journal of Biological Psychology*, 1970(Oct), Vol. 12(1), 41-44. Outlines previous studies with mice on (a) the effect of dimethyl sulfoxide (DMSO) in reducing postirradiation conditioned avoidance responses; and (b) the transferability of the radiation-induced avoidance behavior with injection of a small quantity of brain tissue of saccharin-aversion-trained Ss into the brain or the peritoneal cavity of naive (untrained) Ss. In the present experiments, the effect of DMSO on the transferability of radiation-induced behavior was tested using 30 donor and 90 recipient male CF₁ mice. It was observed that the degree of aversion was markedly reduced when recipient Ss received brain tissue from donor Ss treated topically with DMSO 5-10 min. before irradiation, following a saccharin conditioning period. (15 ref.)—*Journal abstract.*

6313. Maitre, L., Staehelin, M., & Bein, H. J. (CIBA Ltd., Basel, Switzerland) **Effects of benzoctamine (30803-Ba, TACITIN[®]), a new psychoactive drug, on catecholamine metabolism.** *Biochemical Pharmacology*, 1970(Nov), Vol. 19(11), 2875-2892. Investigated the effects of benzoctamine (TACITIN[®]), 1-methyl-amino-methyl-dibenzo[b,e]bicyclo[2.2.2]octadiene, a new psychoactive agent, on catecholamine metabolism. Male albino rats served as Ss. Benzoctamine produced no marked change in the catecholamine concentration of various rat organs after either single or repeated treatment and did not inhibit MAO or catechol-O-methyltransferase activities in liver and brain. It enhanced markedly the incorporation of [^3H]tyrosine into [^3H]catecholamines in brain and adrenals. It accelerated the disappearance rate of intracisternally administered [^3H]noradrenaline. [^3H]noradrenaline uptake in the rat heart and brain was not inhibited. It is concluded that benzoctamine most probably increases the turnover rate of catecholamines. (32 ref.)—*Journal abstract.*

6314. McMillan, D. E. (U. North Carolina, Medical School, Chapel Hill) **Interactions between naloxone and chlorpromazine on behavior under schedule control.** *Psychopharmacologia*, 1971, Vol. 19(2), 128-133.—Used a multiple fixed-ratio, fixed-interval schedule of food presentation to study interactions between

naloxone and chlorpromazine in 4 male white Carneux pigeons. Inactive doses of both drugs could combine to decrease the rate of responding under both schedule components. Inactive doses of naloxone could enhance the rate-decreasing effects of chlorpromazine and inactive doses of chlorpromazine could enhance the rate-decreasing effects of naloxone. When both drugs decreased the rate, the combined effects of the drugs was greater than the sum of the rate-decreasing effects of the individual drugs. Data suggest that the rate-decreasing effects of naloxone and chlorpromazine are synergistic.—*Journal abstract.*

6315. Mechoulam, Raphael; Shani, Arnon; Edery, Habib, & Grunfeld, Yona. (Hebrew U., Pharmacy School, Jerusalem, Israel) Chemical basis of hashish activity. *Science*, 1970(Aug), Vol. 169(3945), 611-612.

6316. Miller, Loren L. (U. Kentucky, Medical Center) Effect of magnesium pemoline on the aversive threshold to shock in the rat. *Psychological Reports*, 1971(Apr), Vol. 28(2), 351-354.—Tested the effect of magnesium pemoline on pain thresholds in 52 Long-Evans female rats via the jump-flinch technique in groups receiving 0, 5, 10, or 20 mg/kg of the drug. No significant differences were found between groups in the number of jumps or the specific mean intensity at which the 1st jump was displayed over 4 series of 17 different shock intensities. Findings are interpreted as refuting the hypothesis that superior performance of drug-treated Ss in avoidance situations is due to a sensitization effect to electric shock brought about by drug action.—*Journal abstract.*

6317. Mills, Patrick D., et al. (U. South Dakota) Running-wheel activity of insulin-injected rats. *Psychological Reports*, 1971(Apr), Vol. 28(2), 415-420.—Assigned 48 male albino rats, on the basis of previous running-wheel activity, to 4 experimental groups: (a) Group I, which received 2 U/kg insulin 30 min. before testing; (b) Group S, which received 2 cc/kg saline 30 min. before testing; (c) Group D, which was food deprived 24 hr. before testing; and (d) a control group, which was neither injected nor deprived. Running-wheel activity was recorded 15 min/day for 8 days. A significantly higher level of activity was displayed by Group D, and a significantly lower level of activity was exhibited by Group I in comparison with Group S and the control group, which did not differ from each other. The decreased activity of Group I is interpreted as being due to specific neuromuscular actions of the drug.—*Journal abstract.*

6319. Nagy, A. & Wollemann, M. (Inst. of Neurosurgery, Biochemical Lab., Budapest, Hungary) Regulatory action of chlorpromazine on the activity of some dehydrogenases. *Aggressologie*, 1970, Vol. 11(4), 327-332.—Investigated the effects of chronic chlorpromazine (CPZ) treatment on rat liver and brain lactic dehydrogenase (LDH), glucose 6-phosphate dehydrogenase (G6-PDH), and succinic dehydrogenase (SDH) levels. Albino rats weighing 200-300 gm. were given daily ip injections of 50 mg/kg CPZ dissolved in .90% saline solution for 1 wk. Controls were given normal saline. Ss were decapitated and cell fractions were prepared from brain and liver homogenates. Results indicate that LDH and G6-PDH activities increased in

liver homogenates while they were inhibited in the brain. SDH activity, in both controls and CPZ-treated Ss increased in the brain and decreased in the liver. For purposes of further elucidation of CPZ effects in vivo, brain and liver cell fractions of homogenates were measured to assess the effective CPZ concentration and time of incubation. It is concluded that in vitro and in vivo activities were similar. When measurements were performed after a 21-min incubation period, the direction of action of CPZ on LDH activity was similar to that of the in vivo. A CPZ concentration of 10^{-3} M produced maximal results. (French, German, Spanish, and Russian summaries) (28 ref.)—P. R. Shibleski.

6320. Pennington, S. N., Chattopadhyay, S. K., & Brown, H. D. (Cancer Research Center, Biochemistry Section, Columbia, Mo.) A possible pathway for ethanol-induced fatty liver and modification of liver injury by antioxidants. *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 13-19.—Investigated from isolated liver microsomes of calves and rats the "interaction of the cytochrome P-450 of the mixed-function oxidase system with ethanol metabolism and the role of an antioxidant in this system. [It was] found that ethanol itself does not appear to interact directly in vitro with this portion of the mixed-function oxidase system; however, the influence of acetaldehyde was pronounced in that this compound appears to oxidize the reduced cytochrome (P-450). In addition, an antioxidant was investigated and found to prevent this inhibition... administration of ethanol over a period of several days in vivo has a pronounced effect on the mixed-function oxidase system... but the possibility that the metabolite of ethanol and not ethanol is responsible for this effect has not been proved."—S. R. Diamond.

6321. Pereira, Walter C., da Rocha, Tania L., & Timo-laria, Cesar. (U. São Paulo, Medical School, Brazil) Efeitos do pentobarbital sódico sobre a atividade elétrica cerebral do rato com lesões da formação reticular mesencefálica. [Action of sodium pentobarbital on the cortical electrical activity of the rat after lesion of the midbrain reticular formation.] *Arquivos de Neuro-Psiquiatria*, 1970(Dec), Vol. 28(4), 324-335.

Employed 35 albino rats prepared for initial and 18 Ss for chronic experiments. The midbrain reticular formation was electrolytically bilaterally destroyed in 24 Ss and unilaterally destroyed in 11 Ss. Interruption of the reticular activating system was checked by strong nociceptive and electrical stimulation below the lesioned area. Increasing doses of pentobarbital were given iv to 35 Ss and up to 18 Ss. The barbiturate always augmented synchronization of the electrocorticogram but induced an early depression of the electrical activity in Ss with bilateral lesions. After barbiturate administration the electrocorticogram of both hemispheres tended to isochronize. Pentobarbital appears to depress the activating system in small doses, thus liberating the synchronizing systems, whereas larger doses block the latter. Only very large doses depress the cortical activity. (15 ref.)—*English summary.*

6322. Pihl, R. O. & Altman, Jack. (McGill U., Montreal, Quebec, Canada) An experimental analysis of the placebo effect. *Journal of Clinical Pharmacology & New Drugs*, 1971(Mar), Vol. 11(2), 91-95.—A placebo response was developed in rats. The strength of the response was related to the number of pairings between the active substance and the conditioned stimuli. Experiments indicated that this effect was a result of the

pairing procedure and could not be attributed to residual traces of the drug or to physical effects resulting from the large number of ip injections. The effect was specific to the drug d-amphetamine. A conditioning model in the development of the placebo response is discussed.—P. J. Federman.

6323. Poschel, B. P. (Parke, Davis & Co., Div. of Medical & Scientific Affairs, Ann Arbor, Mich.) **A simple and specific screen for benzodiazepine-like drugs.** *Psychopharmacologia*, 1971, Vol. 19(2), 193-198.—24 naive, nonhungry, nonthirsty male albino rats ingested inordinate amounts of a sweetened milk solution when given their 1st opportunity to drink the solution while under the influence of benzodiazepine drugs. Among many other drugs tested, only phenobarbital gave a similar, although clearly weaker, effect. The test provides a simple, rapid, sensitive, and specific screen for benzodiazepine-like drugs. The effects were interpreted in terms of these drugs overcoming (disinhibiting) a rat's natural aversion to an unfamiliar food substance without at the same time greatly sedating the S.—*Journal abstract*.

6324. Reiniš, Stanislav. (U. Ghana, Medical School, Accra) **Effect of 5-iodouracil and 2,6-diaminopurine on passive avoidance task.** *Psychopharmacologia*, 1971, Vol. 19(1), 34-39.—Studied the effect of 2 antimetabolites, 2,6-diaminopurine and 5-iodouracil, on passive avoidance learning in 828 Swiss albino mice. The drugs were injected intracranially 48, 24, or 2 hr. before and 1, 2, or 24 hr. after the acquisition trial. The injection of 5-iodouracil 2 hr. before the acquisition trial or 1 hr. after it impaired the performance in the same experimental situation of the Ss tested 48, 72 hr. or 1 wk. after. The same impairment of performance appeared after the injection of 2,6-diaminopurine performed 24 and 2 hr. before or 1 hr. after the acquisition trial. The effect of these substances was probably caused by the interference with the metabolism of nucleic acids during learning.—*Journal abstract*.

6325. Rizzoli, A. A. & Galzigna, L. (U. Padova (Padua), Italy) **Molecular mechanism of unconscious state induced by butyrate.** *Biochemical Pharmacology*, 1970(Oct), Vol. 19(10), 2727-2736.—Reports that the role of butyrate in the induction of the unconscious state in young adult Wistar rats, depends on an interaction of this compound with the lecithin of the neural membrane which is followed by the formation of molecular complexes between butyrate and the central chemical transmitters serotonin and dopamine.—*Journal summary*.

Acute phase (preliminary observations).** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 38-44.—Reports the acute phase of preliminary studies on the neurotoxicological effects of lithium, using 25 adult male rats given either a low sodium or commercial pellet diet. Following ip or iv lithium injections, changes in pulse rhythm and respiration rate were noted. Clinical pathological, biochemical, and CNS electron microscope observation during 2-24 hr. following drug infusion revealed ultracellular membrane alterations, but no definite conclusions were reached.—P. Hertzberg.

6327. Roll, Susan K. (U. California, San Diego) **Intracranial self-stimulation and wakefulness: Effect of manipulating ambient brain catecholamines.**

Science, 1970(Jun), Vol. 168(3937), 1370-1372.—Administered disulfiram, an inhibitor of norepinephrine biosynthesis, to 4 adult male Simonsen Sprague-Dawley rats to see if norepinephrine is a transmitter for motivation in electrical stimulation of the brain. Ss given the drug paused in bar pressing, appearing asleep or sedated; if replaced on the bar, they always resumed pressing at normal rates. It is concluded that the decrease in bar pressing may result from a direct or indirect effect of the drug on wakefulness rather than on reward.—*Journal abstract*.

6328. Roth, Robert H. & Suhr, Youngmin. (Yale U., Medical School) **Mechanism of the γ -hydroxybutyrate-induced increase in brain dopamine and its relationship to "sleep."** *Biochemical Pharmacology*, 1970(Dec), Vol. 19(12), 3001-3012. The naturally occurring CNS depressant γ -hydroxybutyrate (GHB) and its lactone precursor, γ -butyrolactone (GBL) cause a marked and selective increase in brain dopamine and a decrease in homovanillic acid. GBL also causes a selective increase in the specific activity of brain dopamine but not of brain norepinephrine when rats are injected with ^{14}C -tyrosine. This is probably the result of a compensatory activation of dopaminergic neurons. When catecholamine biosynthesis is inhibited by administration of α -methyl- p -tyrosine, GBL completely blocks the disappearance of subcortical dopamine but exerts no antagonism on the disappearance of subcortical norepinephrine. These observations suggest that GBL increases brain dopamine primarily by selectively blocking the release of this monoamine from dopamine containing neurons. Indirect evidence is also presented which suggests that the CNS depressant properties of GHB may be related to this block in the release of brain dopamine. (24 ref.)—*Journal abstract*.

6329. Saiki, Hisashi. (Tokyo Jikei-Kai U., Medical School, Japan) [Effects of injected tocopherol to the behavior of the mice under high oxygen environment.] *Japanese Journal of Aerospace Medicine and Psychology*, 1969(Jun), Vol. 6(2), 15-22.—Investigated the effects of tocopherol and a high oxygen content environment on mouse behavior. Young mice, bred under a high oxygen environment, were given 5 mg. tocopherol every 4 days or a placebo. Results show that Ss, grown to 25 gm. in weight, suddenly decreased their weight in the high oxygen content environment where they could only survive for approximately 10 days. Ss weighing less than 20 gm. did not experience weight loss in the high oxygen concentration environment. In addition, they had a 30-day life span. No significant differences were observable between Ss treated with tocopherol and controls with 1 exception. Ss treated with placebo demonstrated excitable behavior in the periods between 10-15 and 30-35 days, while Ss treated with tocopherol did not. It is concluded that tocopherol prevented excitable behavior in the process of chronic oxygen poisoning under normal pressure environment. This action of tocopherol can be attributed to a biochemical, antioxidant reaction caused by the inhibition of cellular lipid peroxidation.—*English abstract*.

6340. Wise, C. David; Berger, Barry D., & Stein, Larry (Wyeth Lab., Philadelphia, Pa.) Serotonin: A possible mediator of behavioral suppression induced by anxiety. *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl), 34-37.—Tested the hypothesis that norepinephrine and serotonin exert opposing effects on goal-directed behavior by suppressing a simple approach response by a mild electric shock and then attempting to modify the intensity of the suppression with serotonergic drugs. Effects of drugs on the drinking latencies of 68 shocked and 61 unshocked rats were compared. Results support the hypothesis. It was also found that elevation of serotonin level in the brain by a combination of pargyline and 5-HTP significantly increased conditioned suppression. None of the drugs affected drinking latencies of unshocked rats. Results support the view that a central serotonergic system mediates suppressive effects on behavior. (27 ref.)—P. Hertzberg

CARDIOVASCULAR PROCESSES

6341. Davis, John D., Campbell, Constance S., Gallagher, Robert J., & Zurakov, Michael A. (U. Illinois, Chicago, Chicago) Disappearance of a humoral satiety factor during food deprivation. *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 426-432.—Carried out blood transfusions between 22 Sprague-Dawley male albino rats deprived of food for 22 hr and 54 donors deprived of food for 0, 1, 2, 3, 4, or 5 hr immediately prior to transfusions. Following transfusions the 22-hr deprived recipients were given access to food and the amount consumed in 30 min. was recorded. The posttransfusion intake of recipients whose blood had been mixed with nondeprived donors was about 55% of normal, became progressively more normal with increasing deprivation of the donor, and was considerably above normal when the donor was food deprived for 5 hr. Results indicate the presence of a humoral satiety factor in animals not deprived of food. The existence of an appetite regulating or stimulating factor in the blood

is discussed in light of the variation in intake. (20 ref.)—Journal abstract.

Georgia, Tbilisi, USSR) Rontgenobionticheskaia gastiia shimaui kurghlebia dakhovnebia rosh la lobze. *Trudy nauchnoy konferentsii po fiziol. i med. psichologii*, 1970, Vol. 1, 10-12.—The effects of various types of stress on the capacity of the organism to respond after delays of various lengths

to different forms of stimulation (visual, auditory, labyrinthine, and complex), signaling the place where food was available. Also presented are the details of the performance of delayed responses subsequent to summated local irradiation (3000-9000 r) of the head over a period of time. While slowing movement to the food, irradiation with 9000 r did not change the previously determined maximal delayed period for visual, auditory, labyrinthine, and complex perceptions. Total fractional irradiation (2000 r) over a 3-mo period did not lead to marked deterioration of motor reactions until the appearance of the external symptoms of radiation sickness. Maximal delayed periods underwent no change either. (Russian & English summaries) (39 ref.)—*I. D. London*

6350. Hurwitz, D. A., Robinson, S. M., & Barofsky, J. (U.S. Army Research Inst of Environmental Medicine, Natick, Mass.) **Behavioral decrements and brain catecholamine changes in rats exposed to hypobaric hypoxia.** *Psychopharmacologia*, 1971, Vol. 19(1), 26-33. Used the behavior of 19 male Sprague-Dawley rats trained on an avoidance schedule to assess performance decrements at altitude. After adequate base-line behavior of $95 \pm 5\%$ avoidance on 3 consecutive days was attained, Ss were subjected to hypobaric hypoxia (23,000 ft.) for 2 or 4 hr. prior to an experimental session. Performance in this environment was disrupted in that Ss responded primarily to the shock rather than an auditory or visual cue. Brain norepinephrine levels were reduced about 20% in untrained and performing Ss at altitude. Inhibition of MAO with tranylexpromine, 5 mg/kg, prevented the reduction in norepinephrine in untrained Ss at altitude and increased the levels above normal in performing Ss at altitude but did not improve the performance. Data suggest that alterations in the behavior of performing rats at altitude are not related to absolute levels of norepinephrine. (19 ref.)—*Journal abstract.*

6351. Jovanović, Uroš J. (U. Würzburg, Neuroclinic & Polyclinic, W. Germany.) **Der Effekt der ersten Untersuchungsnacht auf die Erektionen im Schlaf.** [Effect of the first examination night on erections during sleep.] *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 295-308. Examined 25-30 yr. old males phallographically in a 1st examination night (unaccustomed examination situation) and on a 2nd successive night to determine the effects of anxiety on penile erections. Results show that penile erections occurred less frequently, were weaker, and were of shorter duration in 24 Ss on the 1st examination night. Results are attributed to anxiety evoked by the exposure to an unknown and strange examination situation on the 1st night. Anxiety evoked while awake and while dreaming has demonstrated ability to exert a negative effect on erections occurring during sleep.—*English summary*

6352. Kaiser, Charles & Roessler, Robert. (U. Houston) **Galvanic skin responses to motion pictures.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 371-374. Examined number and amplitude of GSRs during rest, during a bland, and during a stressor film in 20-22 yr. old male student Ss. The Zuckerman Multiple Affect Adjective Check List (MAACL) was administered before and after both stressor and bland films. The greatest number and amplitude of GSRs were produced during the stress film and the least during the bland film. A direct relationship between number and amplitude of GSRs and MAACL scores was obtained.

The GSR indexes paralleled variations in the content of the stressor film. Results support the interpretation that cognitive factors are important in understanding mechanisms of psychological stress. (17 ref.)—*Journal abstract*

6354. Krabenbuhl, Gary S. (U. Hawaii) **Stress reactivity in tennis players.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 42-46.—Determined stress reactivity for each of 6 male college tennis players through catecholamine excretion analyses in 4 levels of activity. These levels consisted of basal, practice, competition anticipation, and competition situations. These situations were selected because they represent conditions during which the physical and psychic components should vary. Results indicate that significant measurable differences in stress reactivity exist between the 4 levels in the following directional comparison: competition > basal, competition > practice, and competition > precompetition anticipation. An analysis of the role played by the different components of the sport stressor is presented in a discussion of the results.—*Journal abstract.*

6355. Medina, Miguel A. & Merritt, James H. (U.S. Air Force School of Aerospace Medicine, Biosciences Div., Brooks Air Force Base, Tex.) **Drug metabolism and pharmacologic action in mice exposed to reduced barometric pressure.** *Biochemical Pharmacology*, 1970(Oct), Vol. 19(10), 2812-2816.—Reports the effects of reduced barometric pressure on in vitro metabolism of hexobarbital (125 mg/kg), zoxazolamine (90 mg/kg) and pentobarbital (40 mg/kg) in male C-57 black mice. Groups of 12-25 Ss were placed in wire cages in altitude chambers having a pressure equal to 18,000 ft. for 5 days after which they were returned to an environment of normal pressure. Animals were injected with drugs dissolved in normal saline solution with the exception of zoxazolamine. Food and water were permitted as desired throughout the experiment. Drug metabolism in vitro was measured using the Kato and Gillette method. Student's t test was used to assess the statistical significance of the results. Results show that exposure to simulated altitudes of 18,000 ft. result in decreased action and metabolism of hexobarbital and zoxazolamine but not of pentobarbital. (29 ref.)—*B. A. Stanton*

6357. Smith, R. J. (U. Saskatchewan, Saskatoon, Canada) **Control of prespawning behaviour of sunfish (*Lepomis gibbosus* and *Lepomis megalotis*): II. Environmental factors.** *Animal Behaviour*, 1970(Aug), Vol. 18(3), 575-587. Both species showed high levels of aggression in 25°C under short (8-hr light, 16-hr dark) and long (16-hr light, 8-hr dark) photoperiod. Lower and water temperature (11-13°C) inhibited aggression and nesting. A long photoperiod induced nesting by both species in 25°C but only by longears in cold water. A short photoperiod inhibited nesting in both species. Injection of human chorionic gonadotrophin induced nest digging in both species under short photoperiod in

25° C but not in 11-13° C water and had no effect on aggression. Both species dug nests more readily in visual isolation. Androgen secretion, as assayed by nest digging is controlled by photoperiod. Level of aggression depends on water temperature. (28 ref.)—*Journal summary*.

GENETICS

6358. De Laender, Jan. (U. Louvain, Research Center for Psychoanalysis, Belgium) **Sigmund Freud and the belief in the inheritance of acquired characters: II. The role played by Lamarckism in the work of Freud.** *Psychologica Belgica*, 1970, Vol. 10(2), 125-139.—Examines the relationship between Lamarckism and Freudian psychology. Contrary to Jones' view that Freud's links with Lamarckism are of purely contingent nature, Freud's belief in the inheritability of acquired characters can be explained logically and historically and is tied with application of his theory to cultural and historical problems. Emphasized are: (a) impossibility of transmission of totemism to later generations without inheritance of experience, (b) universal symbolism in dreams not traceable to individual experiences, and (c) the concept of inheritance of memory contents. Heredity is thus reduced to the deepest stratum of experience of living species and to the biological deposit of experience of previous generations. This view is at variance with contemporary genetics where hereditary material is characterized by its resistance to experience. (18 ref.)—*S. Slak*.

6359. Glass, David C. (Ed.) **Biology and behavior: Genetics.** New York, N.Y.: Rockefeller U. Press, 1968. vii, 260 p. \$7.50.—2nd in a series of 3 volumes reporting the biology and behavior conferences organized by the Russell Sage Foundation and Rockefeller University. Papers by various authors include discussions of (a) the relationship between genetics and intelligence; (b) behavior genetics research in infrahuman species and its relevance for understanding human social behavior; (c) the role of social competition in natural selection, with particular attention to population control; and (d) biogenetic theories of social structure and process, i.e., stratification, socialization, deviance, and social change.

6360. Hinkelmann, Klaus. (Virginia Polytechnic Inst.) **Estimation of heritability from experiments with inbred and related individuals.** *Biometrics*, 1971(Mar), Vol. 27(1), 183-190.—Assuming an arbitrary amount of inbreeding and certain types of relationships among individuals in the parent population, it is shown how for nested and diallel mating designs the genetic and environmental variance components can be estimated from the mean squares in the usual analyses of variance. The systems of equations are given explicitly for the case of equal numbers of offspring per mating. A method for dealing with unequal numbers of offspring is outlined. —*R. L. McCornack*.

verschiedener Filmdarbietungen als psychologische Ursache für emotionalen Stress. [Investigation of two different film presentations as the psychological cause of emotional stress.] *Psychologie und Praxis*, 1970(Jul), Vol. 14(3), 125-133.—2 very different films (1 with murder, the other with scenic mood contents) were presented to a group of paid college students, viewed in 2 separate sessions on 2 different days of the wk. Ss judged their mood by the polarity profile developed by Hofstaetter in 1962. The 8 dimensions of the profile were correlated for the 2 sessions and then factor analyzed. 3 factors were isolated: predominantly mood and self-criticism, mood judgment of the 1st film session only, and dominated by the mood after the 2nd session. The 1st film was in black and white (murder), the 2nd in color (mood scenes). With relation to emotional stress, the 1st film had a strong, lasting, and depressing effect while the 2nd one showed a lighter, euphoric effect. No change in catecholamine urine content was noted for either experimental group.—*R. F. Wagner*.

NUTRITION & GASTROINTESTINAL PROCESSES

6364. Ehman, G. K., Albert, D. J., & Jamieson, J. L. (Selkirk Coll., Castlegar, British Columbia, Canada) **Injections into the duodenum and the induction of satiety in the rat.** *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 147-166.—Examined ways in which the intestine might participate in the induction of satiety, using direct intestinal injections to alter the contents of the duodenum and then observing the effect on subsequent food intake over a 2½-hr period. Ss were 24 male hooded rats, food-deprived for approximately 17 hr. The injection of either bulk or hypertonic solutions (NaCl or glucose) into the duodenum suppressed food intake. The injection of substantial amounts of food did not have an effect greater than that caused by equivalent amounts of nonnutritive bulk and the injection of acid material did not suppress eating more than basic material. These results suggest that bulk and osmotic pressure in the duodenum may initiate physiological changes which can ultimately participate in the regulation of meal size but that metabolites, duodenal hormones, and specific dynamic action do not. With the gastrointestinal system intact, the flow of material from the stomach to the intestine would be sufficiently slow that neither changes in duodenal bulk nor osmotic pressure would be involved in the regulation of meal size. When the stomach is partially removed or denervated, the rate of passage of food into the duodenum may increase enough so that osmotic and bulk signals originating in the duodenum would help to regulate meal size. São Paulo, Medical Faculty of Ribeirão Preto, Brazil) **Alterações eletroencefalográficas relacionadas a deficiências nutritivas.** [Electroencephalographic changes related to nutritional deficiencies.] *Arquivos de Neuro-Psiquiatria*, 1970(Dec), Vol. 28(4), 357-361.—Reports EEG changes in a group of 20 children with nutritional disorders. Results suggest a significant difference in the EEG of Ss with undernutrition and

those with protein-caloric deficiency. These alterations correspond to the incidence of diffuse cerebral involvement and/or discharges of an epileptic focal activity. The relatively high incidence of focal discharges may be explained on the basis of a very low epileptiform threshold of the cerebral cortex in children with nutritional disease.—*English summary.*

6366. Schachter, Stanley. (Columbia U.) **Eat, eat.** *Psychology Today*, 1971(Apr), Vol. 4(11), 45-47, 78-79.—Reports of hunger coincide with physiological measures for normal-weight people, but not for the obese. A series of studies shows that the eating behavior of obese Ss is very dependent on external factors (taste, time of day, and quantity of food visible). The amounts of food eaten by normal-sized Ss were seldom influenced by such variables. Attempts to aid obese people to lose weight by altering their internal physiological symptoms of hunger are ineffective probably because obese people do not use internal cues to control eating.—*E. J. Pasavac.*

6368. Ison, James R. & Hammond, Geoffrey R. (L. Rochester) **Modification of the startle reflex in the rat by changes in the auditory and visual environments.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 435-452.—Conducted 6 experiments with a total of 69 male Holtzman albino rats. The temporal functions relating inhibition and facilitation of the startle reaction, elicited by an intense auditory stimulus, to momentary and to prolonged acoustic and visual stimuli were studied. The extent of inhibition was positively related to the intensity of the stimulus in both modalities. The extent of facilitation was positively related to the intensity of the visual stimulus but nonmonotonically related to the intensity of the auditory stimulus, a relationship confirmed in a study of the effects of background noise level on startle behavior. Data are correlated with physiological processes which provide similar effects at the electrophysiological level. Some implications drawn for experiments on classical conditioning and habituation are discussed. (46 ref.)—*Journal abstract.*

EARLY EXPERIENCE

6375. Galef, Bennett G. (McMaster U., Hamilton, Ontario, Canada) **Social effects in the weaning of domestic rat pups.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 358-362.

—Conducted 3 experiments with 33 female hooded rats and their offspring. Results of previous experiments by B. Galef and M. Clark (see PA, Vol. 46:Issue 4) had indicated that adult members of a wild rat colony play a major role in determining the diet on which rat pups born to colony members 1st feed. The present experiments examined the nature of the interactions between adult and young rats which affect the initial food choices of the young. Results indicate that the interaction is not due to imitation of the adults by the young but rather to a tendency on the part of the young to approach areas in which the adults are located and begin feeding there.—*Journal abstract.*

6376. Galef, Bennett G. & Clark, Mertice M. (McMaster U., Hamilton, Ontario, Canada) **Social factors in the poison avoidance and feeding behavior of wild and domesticated rat pups.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 341-357.—Conducted 10 experiments with wild Norway rats, 1st generation laboratory-bred wild rats, hooded rats, and their respective litters. It was found that when a colony of adult wild rats learned to avoid 1 of 2 palatable diets as a result of that diet's previous association with poison, rat pups born to colony members did not eat any of the diet the adults were avoiding. The pups continued to avoid that diet following their removal to a new enclosure isolated from the adults. This finding is interpreted as resulting from a 3-stage process in which the pups 1st follow the adults to food, then learn cues associated with that food, and thereafter avoid alternative diets as a result of their neophobia. The phenomenon is discussed as an adap-

tation facilitating food location by weanling rats rather than as a primary poison-avoidance mechanism. (21 ref.)—*Journal abstract.*

6377. Gallup, Gordon G. & McClure, Michael K. (Tulane U.) **Preference for mirror-image stimulation in differentially reared rhesus monkeys.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 403-407.—Conducted 2 experiments with 10 captive-born surrogate-raised and 8 feral rhesus monkeys. When given a choice between viewing themselves in a mirror or looking at another monkey, feral Ss seemed to prefer viewing the conspecific. Surrogate-reared Ss spent appreciably more time viewing the mirror and interacted more with their reflection than with the conspecific. Results are interpreted in terms of the effects of early social isolation and the psychological properties of mirrors.—*Journal abstract.*

6378. Klopfer, Peter H. (Duke U.) **Imprinting: Determining its perceptual basis in ducklings.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 378-385.—Conducted 5 experiments examining the effect of S or model movement on the imprinting process. Imprinting tests with 450 Pekin ducklings established that subsequent changes in behavior require movement of both the S and the imprinting object. The cues by which the imprinting objects are subsequently discriminated depend on the solidity of the objects, different 2-dimensional representations being treated as equivalent. (16 ref.)—*Journal abstract.*

6379. Kovach, Joseph. (Menninger Foundation, Topeka, Kan.) **Interaction of innate and acquired: Color preferences and early exposure learning in chicks.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 386-398.—Presented identical flashing stimulus patterns of 4 different colors (blue, green, yellow, and red) in paired combinations to Rhode Island Red chicks. 180 Ss were dark-reared, 180 had experience with achromatic light, and 348 had controlled experience with colors. Results indicate significant differences in the development of color preferences in dark-reared and visually experienced Ss. Blue and red were preferred over green and yellow in the former, but only a prolonged perceptual exposure to blue and red resulted in the development of significant preferences (for blue and red) in the latter. Systematic exposure to the colors of highest and lowest naive preference (blue and green) at 3 stimulus intensity levels over 2 log units did not alter preference for blue after exposure to blue, nor the lack of preference for green after exposure to green. INSTINCTS

6382. Hartman, G. F. (U. Guelph, Ontario, Canada) **Nest digging behavior of rainbow trout (*Salmo gairdneri*).** *Canadian Journal of Zoology*, 1970(Nov), Vol. 48(6), 1458-1462.—The rate of digging (digging bouts/10-min interval) and number of body flexures/dig were measured on a wild population of trout as they built their nests. Their behavior was nocturnal at first but became nearly steady throughout the day as spawning time approached. Rate of digging increased greatly immediately after spawning while the number of body flexures decreased sharply at this time. Contacting the bottom of the nest (external stimuli) and egg release (internal stimuli) are discussed as factors influencing nest building behavior.—*J. M. Roberts.*

6383. Koepke, Jean E. & Pribram, Karl H. (Simon Fraser U., Burnaby, British Columbia, Canada) **Effect of milk on the maintenance of sucking behavior in kittens from birth to six months.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 363-377.—Manipulated the amount of milk received for sucking in kittens from birth to 6 mo. by permitting 5 Ss, the milk-sucking group, to suck at a lactating cat, and 5, the dry-sucking group, to suck at a nonlactating cat which was anesthetized. All Ss were fed by using a stomach-loading technique. The dry-sucking group spent as much time sucking as the milk-sucking group during the 1st 3 wk. but sucked increasingly less thereafter, though they continued to suck some throughout the 6 mo. At no time did the dry-sucking group initiate sucking less often than the milk-sucking group, suggesting that the effect of milk was mainly in prolonging sucking episodes. Results suggest that neither the acquired drive nor the unlearned oral drive hypothesis is adequate to explain sucking. Observations regarding playing, sleeping, nuzzling, and nipple grasping are also reported.—*Journal abstract.*

MOTIVATION & EMOTION

6386. Aivazashvili, I. M. (Inst. of Physiology, Tbilisi, USSR) **Vliyanie razlichnykh emotsional'nykh vozdeistvii na otsrochennyye reaktsii sobaki.** [Effect of different emotional influences on delayed reactions in the dog.] *Sovremennyye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 3, 14-28.—3 dogs (2 highly excitable, 1 less excitable) were used to study the influence of positive and negative emotional excitation upon various periods of delayed reaction in the process of complex perception of food location. Strong positive natural emotional stimulation, applied

once at various times during the different periods of delay (1-2 min. teasing of the dog with food followed by feeding) and producing a complex picture of motor reactions (strong alimentary excitation) did not destroy its ability to execute delayed reactions. A natural negative emotional stimulation (threatening with a stick) during different periods of delay, eliciting in Ss either passive- or active-defense activity, did not produce a disturbance of delayed reactions. Either weak electrical stimulation (25 V), delivered to the S during the period of delay, also failed to disturb its ability to execute delayed responses. Electrical stimulation with an intensity of 40 V produced a short-term disturbance of general behavior in the case of delayed reactions. Delayed reactions in the S were easily suppressed and for a long time if in the customary experimental situation it was subjected to strong painful electrical excitation, causing in it the emotional reaction of "fear" expressed in avoidance of the experimental setting. (English summary) (19 ref.)—*J. D. London*.

6388. Goodrick, Charles L. (Baltimore City Hosp., Gerontology Research Center, Md.) Variables affecting free exploration responses of male and female Wistar rats as a function of age. *Developmental Psychology*, 1971(May), Vol. 4(3), 440-446.—Tested a total of 352 male and 352 female immature, adolescent, young mature, old mature, and senescent Wistar rats in 4 experiments to determine free exploration responses within an open field. Exploration responses were greater for immature and young mature Ss than adolescent, old mature, or senescent Ss. Females explored more than males of all ages. Variables of testing in the dark portion of the dark-light cycle, paired testing, and gentling prior to testing generally resulted in greater exploration responses of adolescent Ss, compared with controls, but had little effect upon exploration scores of old Ss, compared with low-scoring controls. During gentling, old mature and senescent Ss were more emotional than younger Ss, and senescent Ss did not reduce emotionality scores as did Ss in younger groups.—*Journal abstract*.

6389. Hulse, Stewart H. & Suter, Steve. (Johns Hopkins U.) Emitted and elicited behavior: An analysis of some learning mechanisms associated with fluid intake of rats. *Learning & Motivation*, 1970(Aug), Vol. 1(3), 304-315.—24 naive female Sprague-Dawley rats licked single drops of water. 3 groups licked either .004-, .012-, or .020-ml drops, while a 4th licked all 3 sizes in random order. Approach latencies to drops and the duration of licks and interlick intervals were measured. The response to a drop was typically a single burst of licks, lick rate decayed in time during the burst. For Ss exposed to single drop sizes bigger drops produced longer bursts of licks at a higher rate, and shorter approach latencies, than smaller drops. For Ss exposed to all 3 sizes, bursts varied in length the same way, but approach latencies were uniformly short. Data speak to the stereotypy of licking, to theories of reinforcement, e.g., those of K. W. Spence and F. D. Sheffield, and to the distinction between elicited and emitted behavior.—*Journal abstract*.

6390. Kurtz, Kenneth H. (State U. New York, Buffalo) Food deprivation and effort expended for food. *Learning & Motivation*, 1970(Aug), Vol. 1(3),

281-296.—Investigated in 4 experiments wheel turning by 12 male albino rats under several conditions of food deprivation. 2 procedures were compared: 1 in which force required to turn the wheel remained constant throughout a session and 1 in which required force increased progressively with each revolution of the wheel. Rate of wheel turning decreased as a linear function of force required. Increasing deprivation displaced the rate-force function upward without changing its slope. When body weight was reduced by gradual stages, performance reached a maximum at approximately 78% ad libitum weight and declined with further weight reduction. Results are interpreted in terms of a utility model in which the gains and costs associated with responding are increasing functions of response rate, and S selects the response rate for which net gain (utility) is greatest. In this context, deprivation is construed as modifying the value of food. (18 ref.)—*Journal abstract*.

6391. Mendelson, Joseph & Chillag, Dana. (Ruigers State U.) Tongue cooling: A new reward for thirsty rodents. *Science*, 1970(Dec), Vol. 170(3965), 1418-1420.—Thirsty rodents will persistently lick a stream of dry air pumped through a standard drinking tube. This air-licking is attenuated by experimental manipulations which reduce the evaporative cooling of the tongue and mouth produced by the airstream. This suggests that such cooling is itself an effective reward for thirsty rodents. This hypothesis was tested by presenting thirsty rodents with a piece of cold, dry metal. Initially, Ss were 2 male and 2 female rats, mice, guinea pigs, and hamsters (hamsters added later). Different species spent from 9-40% of their session time licking the cold metal. When deprived of water hamsters reared from birth without access to drinking water licked cold metal in preference to metal maintained at room or body temperature. This preference was approximately equal to that of littermates reared normally. It is concluded that tongue cooling is a primary reward for thirsty rodents. (15 ref.)—*Journal abstract*.

6395. Ardila, Ruben. (U. Nebraska) A parametric investigation of transposition. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5012.

6396. Baum, Morrie & Myran, David D. (Bishop's U., Lennoxville, Quebec, Canada) **Response prevention (flooding) in rats: The effects of restricting exploration during flooding and of massed vs distributed flooding.** *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 138-146.—Conducted 2 experiments with 33 and 60 female hooded rats to determine ways of decreasing or increasing the efficacy of response prevention (flooding). In Exp. I, Ss were trained to avoid electric shock and following learning some groups were given the response-prevention treatment. (Response prevention consisted of thwarting the avoidance response while forcing Ss to remain in the presence of the feared stimuli.) Mechanically confining the Ss during response prevention (interfering with the occurrence of spontaneous exploration and locomotion) decreased the efficacy of the treatment in leading to extinction of the avoidance response. In Exp. II, Ss were trained to avoid intense shock and then were given response prevention in either 1 single, long-duration session or in several shorter sessions distributed over days (massed vs. distributed flooding). Results indicate that distributed response prevention was more effective than massed response prevention. (French summary) —*Journal summary*.

6397. Beritashvili, I. S. & Alvazashvili, I. M. (Inst. of Physiology, Tbilisi, USSR) **O prodolzhitel'nosti kratkosrochnoi pamyati u sobak v raznykh usloviyakh opyta.** [On the duration of short-term memory in dogs under various experimental conditions.] *Sovremennye Problemy Deyatel'nosti i Stroeniya Tsentral'noi Nervnoi Sistemy*, 1968(Sep), Vol. 2, 29-44.—3 dogs were Ss in a study of short-term memory of the "visual perception of food" as a function of the conditions of its location. When food was shown 1-2 times daily in any new place in the experimental setting, then the maximum delay for the right reaction in the form of running to the location of food extended up to 2 hr. in most cases. When the S received food many times in the course of the experimental day in different places of the experimental room, then after showing food in 1 of these places, the duration of delay declined to 20-25 min. If the food was placed within the S's field of vision in several places in a given setting over a period of time, then the duration of delay for a correct reaction was considerably shorter: (a) in the case of food being placed in the S's field of vision at a distance of 4 m., the duration of delay was not more than 15 min., and (b) if the food was placed at a distance of 1.5 m., the duration of delay ranged within the limits of 5 min. A physiological explanation is offered for the origin of this difference in the duration of the delay of the alimentary-motor reaction—an explanation involving the competition and extinction of competing images of the location of the food. (English summary) (16 ref.)—*I. D. London*.

6398. D'Amato, M. R. & O'Neill, Ward. (Rutgers State U.) **Effect of delay-interval illumination on matching behavior in the capuchin monkey.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 327-333.—Demonstrated in Exp. I that delayed matching-to-sample in 3 adult male capuchin monkeys was superior when the delay interval was spent in darkness rather than in moderate illumination. In contrast with previous studies in which the delayed-matching ability of primates appeared limited to 60 sec. or less, in the dark condition all Ss showed above-chance matching at a 120-sec delay interval. Exp. II, with 2 adult

female *Cebus apella*, verified that darkness during the delay interval can facilitate delayed matching and provides evidence that the effective variable was the illumination level of the delay interval rather than change in illumination, which in Exp. I was confounded with illumination level.—*Journal abstract*.

6399. Davenport, Richard K. & Rogers, Charles M. (Georgia Inst. of Technology) **Intermodal equivalence of stimuli in apes.** *Science*, 1970(Apr), Vol. 168(3928), 279-280.—Reports an experiment designed to determine if apes possess the capacity to utilize visual cues to solve tactual problems. Ss were 3 chimpanzees and 2 orangutans, who were presented 3 objects, 1 of which could be seen (the sample) and the other 2 touched. Results indicate that Ss were able to discriminate between the 2 objects on the basis of tactile cues and select the 1 that matched the visually presented sample. Results demonstrate the presence in apes of a metamodal concept of stimulus equivalence which is based on a mediation process independent of verbal language.—*Journal abstract*.

6400. Davis, J. Michael. (Duke U.) **Testing for inhibitory stimulus control with S- superimposed on S+.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 365-369.—4 white Carneaux pigeons (2 naive and 2 experienced) learned a successive discrimination between a positive stimulus (red) correlated with a variable-interval 1-min reinforcement schedule and a negative stimulus (vertical line) correlated with either a variable-interval 5-min schedule or extinction. Transfer tests measured the rate of responding to the positive stimulus alone, to various orientations of the negative stimulus, and to the same line orientations superimposed on the positive stimulus. Although there were no gradients with minima at the training value for the negative stimulus dimension, the addition of the negative stimulus dimension to the positive stimulus always resulted in a lower response rate than that for the positive stimulus alone. Results demonstrate that an operational definition of inhibitory stimulus control that requires increased responding to stimuli more distant from a negative stimulus (along some dimension) is not always consistent with a definition that requires the suppression of responding in the presence of the positive stimulus, by the simultaneous presentation of the negative stimulus.—*Journal abstract*.

6401. Freeman, Betty J. (Southern Illinois U.) **Behavioral contrast: Reinforcement frequency or response suppression?** *Psychological Bulletin*, 1971(May), Vol. 75(5), 347-356.—Reviews recent studies dealing with behavioral contrast effects and notes 2 major interpretations of the phenomena: (a) the emotional consequences of response suppression, and (b) changes in reinforcement frequency. Special emphasis is placed on studies which have attempted to separate the effects of these 2 variables. The methodological problems inherent in any attempt to separate reinforcement frequency and response rate are discussed. (48 ref.) —*Journal abstract*.

6402. Greene, Richard L. & Jennings, Joseph W. (U. Montana) **Apparatuses for assessing maze learning in the isopod (*Porcellio scaber*).** *Journal of Biological Psychology*, 1970(Oct), Vol. 12(1), 37-40.—Tested differences between some typical maze cross sections and mazes to define an apparatus adequate for testing maze learning in isopods. Straight alley latency data of 40 Ss were recorded for square, semicircle, circle, and

triangle cross sections. Ss ran significantly faster in a square cross section alley and significantly slower in a triangular cross section alley, with circle and semicircle cross sections intermediate. Then escape responses of 30 Ss were recorded for T, Y, and cross mazes. Learning occurred in all apparatuses. The T and cross mazes produced significantly better performance than the Y maze.—*Journal abstract.*

6403. Jarrard, Leonard E. & Moise, Samuel L. (Carnegie-Mellon U.) **Short-term memory in the stump-tail macaque: Effect of physical restraint of behavior on performance.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 267-275. Investigated short-term memory in 1 female and 2 male stump-tail macaque (*M. speciosa*) by employing a delayed matching from sample task. The importance of hypothesized "incompatible" responses (grooming, moving around the testing compartment) during delay intervals was evaluated under conditions of free movement and physical restraint in a primate chair. Data on latencies of response following onset of sample and test stimuli were analyzed with analysis of variance. Percent correct responses at each delay indicate no significant differences between the 2 conditions. The resulting short-term memory curves are similar in form to those found in human experiments where interpolated activity prevents rehearsal during retention intervals.—*Journal summary.*

6404. Mackay, Harry A. & Brown, Stephen M. (Massachusetts General Hosp., Boston) **Teaching serial position sequences to monkeys with a delayed matching-to-sample procedure.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 335-345. Compared 2 methods for training monkeys to "observe" a 2-member serial position sequence by pressing 2 consecutively lighted keys and then to "report" the sequence by pressing the same 2 keys in the same order but without the lights. Ss were 4 rhesus monkeys. A fading technique involving gradual elimination of brightness cues from "reporting" keys was found more effective than a no-fading procedure in which the cues remained bright during training and then were suddenly removed. Ss that failed to learn to report a new sequence with the no-fading procedure sometimes developed behavior incompatible with that desired. They made repeated and specific errors that prematurely terminated trials of the sequence to be learned, even though the correct key was cued by a bright light. They behaved appropriately, however, on succeeding trials of other sequences. Thus, the errors were followed by trials on which reinforcement occurred. Manipulation of this contingency indicates its importance in maintaining the stereotyped error patterns. (20 ref.)—*Journal abstract.*

6405. Pryor, Karen. **Behavior modification: The porpoise caper.** *Psychology Today*, 1969(Dec), Vol. 3(7), 46-49, 64. Experiments with 2 porpoises indicated that the production of novel behavior can be reinforced. Sessions were held in which only novel behaviors were reinforced. Previously reinforced behaviors were ignored. Both porpoises learned that new behaviors were required and performed complex series of maneuvers which would have been difficult if not impossible to shape specifically. Spontaneity and creativity might be induced in many species using a similar procedure.—*E. J. Posavac.*

6406. Werboff, Jack & Lavery, J. Jeffrey. (U. Connecticut Health Center, Storrs) **Spatial and visual maze learning, and motivation in *Mus musculus* and**

***Peromyscus*. Perceptual & Motor Skills**, 1970(Apr), Vol. 30(2), 591-598.—Compared performance and learning of 3 groups of adult mice. *Mus musculus* (80 wild and 80 C57BL/6J) and 60 *Peromyscus maniculatus* Bairdii on 2 types of water maze (spatial or visual) under 4 levels of motivation (25, 35, 45, or 115 F water temperature). The wild *Mus* learned most rapidly, the *Peromyscus* being the slowest to learn. Extremes of water temperature and the spatial discrimination task facilitated performance and learning. *Journal abstract.*

Conditioning

6407. Frieman, Jeanne P., Frieman, Jerome; Wright, Wesley, & Hegberg, William. (Kansas State U.) **Developmental trends in the acquisition and extinction of conditioned suppression in rats.** *Developmental Psychology*, 1971(May), Vol. 4(3), 425-428.—Trained 18 infant and 18 adult male Sprague-Dawley albino rats to lick a drinking tube for water. Ss were then given conditioned suppression training (repeated stimulus-shock pairings) until a criterion of suppression was reached. Following this training, extinction of suppression was instituted by presenting the CS alone (no shock) while licking was still reinforced. Analysis of the number of trials to reach criterion did not show any age differences; however, adult Ss extinguished suppression to the CS more rapidly than infants. Results are considered in relation to how differential extinction between young and adult rats might explain age-related differences in stimulus generalization. (15 ref.)—*Journal abstract.*

6408. Galvan, Peter F. (U. Iowa) **Effects of the contingency between CS and US on Pavlovian fear conditioning.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5659-5660.

6411. McHose, James H., Maxwell, Frederick R., & McHewitt, Earl R. (Southern Illinois U.) **Effects of nonreward in S+ and S- on performance in differential conditioning.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 282-284.—108 male albino Holtzman rats, distributed across 4 experiments, received differential conditioning training in a black-white runway discrimination apparatus. Results of the 1st 3 experiments show that greater depression of S+ speeds results from nonreward as compared with small reward in S-. Results of the 4th experiment, in which some Ss received occasional nonreward in S-, are compatible with an incentive-averaging equation developed to account for the effects of occasional small reward in S+.—*Journal abstract.*

6412. Morris, Scot A. (Southern Illinois U.) **A comparison of the classical and gradient methods of extinguishing a conditioned fear response.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5631-5632.

Discrimination

6414. Beach, Frank A. (U. Hawaii) **Complex learning in the dolphin with auditory stimuli.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5013-5014.

6415. Daly, Helen B. (State University Coll. New York, Oswego) **Evidence for frustration during discrimination learning.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 205-215.—Assigned 120 male Sprague-Dawley rats to 8 groups receiving 30 or 60 runway trials of (a) discrimination training, (b) partial reinforcement, (c) continuous reinforcement, or (d) 0 reinforcement. Ss were then given hurdle jump training. Groups a, b, and c did not differ from each other in speed of hurdle jumping, and the number of runway acquisition trials did not influence hurdle-jump performance. All of these groups learned to jump the hurdle faster than Group d. A 2nd experiment with 128 male Holtzman rats demonstrated hurdle-jump acquisition after 24 or 96 discrimination learning trials and showed that groups given discrimination training to a large vs. small reward, rather than a large vs. no reward, also learned to jump the hurdle to escape from the stimuli paired with the small reward. Results provide evidence for A. Amsel's (see PA, Vol. 33:7687) frustration analysis of discrimination learning. (18 ref.)—*Journal abstract*.

6416. Galloway, William D. (U. Maryland) **Stimulus control in a two-choice discrimination procedure.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5020-5021.

6417. Grimm, Jeffrey A. (West Virginia U.) **Conditioning and extinction of a complex discrimination.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5023.

6418. Hearst, Eliot. (U. Missouri) **Contrast and stimulus generalization following prolonged discrimination training.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 355-363.—15 experimentally naive female white Carneaux pigeons in 4 groups received discrimination training in which the reinforcement-associated and extinction-associated stimuli were, respectively, either (a) a line tilt vs. a blank key, (b) a blank key vs. a line tilt, or (c) 2 different line tilts. The high response rates that developed to the positive stimulus in all groups during discrimination learning were maintained over 64 sessions of training. After these sessions, all Ss were tested for stimulus generalization along the line-tilt dimension. Gradients of relative (percent) generalization around the stimulus associated with reinforcement (so-called excitatory gradients) and around the stimulus associated with extinction (so-called inhibitory gradients) were as steep as they typically are after much briefer training periods. Results do not support several of H. S. Terrace's predictions on the basis of the hypothesis that emotional responses develop to the stimulus associated with extinction during discrimination learning with errors, but eventually dissipate after extended training. (15 ref.)—*Journal abstract*.

6419. Mandler, Jean M. (U. California, San Diego) **Two-choice discrimination learning using multiple stimuli.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 261-266.—In 2 experiments 16 and 24 male hooded rats, respectively, were trained in a Y maze on a 2-choice simultaneous visual discrimination task in which either a constant positive stimulus was used and the negative stimulus varied from trial to trial, or a constant negative

stimulus was used and the positive stimulus varied. In both experiments the constant S- multiple S+ discrimination was easier to learn than the constant S+ multiple S- discrimination.—*Journal abstract*.

6420. Morgan, M. J. & Firsirot, G. I. (McGill U., Montreal, Quebec, Canada) **A comparison between the reinforcing and discriminative functions of a stimulus.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 248-260.—After learning a discrimination based upon illumination change, 7 female hooded rats were exposed to an extinction schedule in which lever presses during the previously negative stimulus caused the previously positive stimulus to come on and vice versa. Response rates remained much higher in the presence of the positive stimulus than in the negative, arguing against J. A. Dinsmoor's suggestion that the reinforcing and the discriminative effects of a stimulus are quantitatively identical. It is suggested that Dinsmoor's own results arose because his measure of secondary reinforcement was strongly "contaminated" by direct discriminative effects of the stimulus. A computer simulation in a 2nd experiment is used to show that exact coincidence of discriminative and reinforcing effects in these circumstances is not so unlikely as Dinsmoor had supposed.—*Journal summary*.

6421. Riley, Donald A. & Leuin, Terry C. (U. California, Berkeley) **Stimulus-generalization gradients in chickens reared in monochromatic light and tested with a single wavelength value.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 399-402.—Reared 51 White Leghorn chickens in a monochromatic light of 589 nm. Ss were trained to peck at a key of the same wavelength. To eliminate negative afterimages, no intertrial blackouts were used in training. Following training, Ss were tested in extinction. 1 group was tested with all test stimuli (589 nm., 569 nm., and 550 nm.). 3 other groups were tested with only 1 stimulus: 1 group with each value. Peck rate declined as a function of remoteness in wavelength of the test stimulus from the training value regardless of whether Ss were tested with all values or only 1. It is concluded that the generalization gradient does not depend on prior training or differential experience on the hue dimension.—*Journal abstract*.

6422. Weiss, Stanley J. (American U.) **Discrimination training and stimulus compounding: Consideration of non-reinforcement and response differentiation consequences of S-.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 387-402.—In Exp. I, 4 adult naive male hooded rats were trained on a 2-component multiple schedule with tone and light each associated with different variable-interval schedules. Extinction in light-out no-tone, common to previous studies reporting additive summation to compounded discriminative stimuli, was omitted from training. In testing, the simultaneous presentation of tone and light controlled a response rate intermediate between that controlled by these stimuli presented singly. In Exp. II, Ss were trained on 3-ply multiple schedules. While tone and light were each associated with variable-interval schedules for both groups, light-out no-tone signaled extinction for 1 and differential-reinforcement-of-behavior-other-than-bar-pressing for the other. This permitted response reduction during light-out no-tone to be viewed independently of non-reinforcement. Responding of both groups showed summation to tone plus light in testing, with the effect

clearly larger for extinction-trained Ss. Results indicate that (a) discrimination training afforded by extinction has been integral to additive summation previously reported, (b) response differentiation and nonreinforcement consequences of extinction training contribute to the magnitude of summation, and (c) summation and peak shift might be functionally related phenomena. (19 ref.)—*Journal abstract.*

Avoidance & Escape

6423. Dyer, Robert S. (State U. New York, Buffalo) **Influences of guinea pig visual system upon two-way avoidance learning.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5657.

6424. Myers, Arlo K. (U. California, Riverside) **Escape conditioning followed by extinction with and without the aversive training stimulus.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 316-320.—48 female albino Holtzman rats received 2 hr. of operant wheel-turning training to escape either a weak shock or a loud white noise, followed by 1 hr. of extinction with either (a) continuous shock (or noise), or (b) no stimulus. Significantly more extinction responses occurred with the aversive stimulus present than with it absent. Control Ss "trained" with noncontingent stimulus changes showed no such effect in "extinction." Shock-trained and noise-trained Ss did not differ significantly in acquisition or extinction. Results parallel those of studies in which deprived Ss are trained with appetitive reinforcement, then extinguished with or without deprivation and without reinforcement.—*Journal abstract.*

Reinforcement

6425. Bauermeister, José J. (Florida State U.) **Positive reinforcement: Further tests of the Premack theory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5651.

6426. Kendall, Stephen B. (U. Western Ontario, London, Canada) **Reinforcement by stimuli associated with S-.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 367-374.—Trained 3 white carneau pigeons in a situation where they responded on a fixed ratio (FR) schedule in the presence of a yellow light. Following the completion of each FR the key was darkened for either 30 sec. or 2 min. (S- period). A peck to the dark key produced 1 of 2 colors: green if the 30-sec S- period was in effect, blue if the 2-min S- period was in effect. Ss responded to produce these stimuli but showed a rate decrease when the 2 colors were no longer correlated with the duration of S- 1 S had probably formed a superstitious chain during training and results from this S were equivocal.—*Journal abstract.*

6427. Mellgren, Roger L. (Indiana U.) **Positive contrast in the runway as a function of the number of preshift trials.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5669-5670.

6428. Riem, Kark F. (Marquette U.) **The effect of a secondary reinforcer (CS) on the longevity of *Brachydania rerio* (zebra fish).** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5037.

6429. Schick, Karl. (Harvard U.) **Operants.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 413-423. Discusses the definition of an operant

as a response class each of whose members possesses the property upon which reinforcement is contingent. It is suggested that this definition is not broad enough to cover the units that are supposed in Skinner's accounts of extinction, superstition, and transfer of learning. A broader definition is suggested. Properties defining operants are discussed.—*Journal abstract.*

6430. Senkowski, Peter C. (U. Iowa) **Temporal course of motivational after-effects of reward and nonreward.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5678-5679.

6431. Staddon, J. E. (Duke U.) **Temporal effects of reinforcement: A negative "frustration" effect.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 227-247.—Reinforcement omission in situations that show positive goal-gradients elevates subsequent responding (positive "frustration" effect). In this experiment with White Carneaux pigeons, a standard, single-key, operant conditioning apparatus was used. In a situation showing a negative goal-gradient, reinforcement omission depressed subsequent responding (negative "frustration" effect). A simple hypothesis in terms of discriminative aftereffects of reinforcement accounts for both effects. The same interpretation is adequate to describe frustration effects in runways and avoids problems faced by frustration theory. Further tests of the hypothesis are proposed. (47 ref.)—*Journal abstract.*

6432. Walker, William R. (U. Mississippi) **Secondary reinforcement as a function of neutral stimulus-primary reinforcer overlap.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5683.

6433. Waller, T. Gary. (U. Waterloo, Ontario, Canada) **Variable reward and choice behavior of rats.** *Learning & Motivation*, 1970(Aug), Vol. 1(3), 276-280. Varied reward conditions for a correct response for 3 (Total N = 51) of experimentally naive male albino Sprague-Dawley rats in a T maze. Groups 2-0 and 4-0 received 50% reward for correct responses with 2 and 4 pellets, respectively. Group 4-2 received 4 pellets for 50% of the correct responses and 2 pellets for the other 50%. Performance of Group 4-2 was predictable from performance of Groups 4-0 and 2-0. (18 ref.)—*Journal abstract.*

6434. Winokur, Stephen. (Texas Christian U.) **Skinner's theory of behavior: An examination of B. F. Skinner's contingencies of reinforcement: A theoretical analysis.** *Journal of the Experimental Analysis of Behavior*, 1971(Mar), Vol. 15(2), 253-259.—Analyzes Skinner's latest book, *Contingencies of Reinforcement* with respect to different schools of behavior theory (i.e. with J. B. Watson, behavioral genetics, etc.) in order to show the points of departure and individualism of Skinner's theory. Rule-governed behavior, and behavior in relation to genetics and perception are discussed. It is suggested that Skinner's systematic and consistent analysis of behavior may provide the basis for a 2nd behavioristic revolution.—P. Hertzberg.

Reinforcement Schedule

6435. Blue, Scot; Sherman, J. Gilmour, & Pierrel, Rosemary. (Rutgers State U.) **Differential responding as a function of auditory stimulus intensity without differential reinforcement.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 371-377.—Trained 2 groups of 4 male albino Sprague-

Dawley rats each to bar press on a variable-interval 2-min schedule. During training, either 3, 5, or 9 auditory stimuli of various intensities were randomly presented. A direct relationship between stimulus intensity and rate of responding was obtained, but it was more consistent in the group trained initially with 3 stimuli than for the group that started with 9 stimuli. Results are related to the concept of stimulus intensity dynamism and the necessary conditions for the acquisition of stimulus control.—*Journal abstract.*

6436. Catania, A. Charles. (New York U.) **Reinforcement schedules: The role of responses preceding the one that produces the reinforcer.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 271-287.—In a 2-key pigeon chamber, variable-interval reinforcement was scheduled for a specified number of pecks, emitted either on a single key or in a particular sequence on the 2 keys. Ss were 4 adult male white Carneaux pigeons. Although the distribution of pecks between the 2 keys was affected by whether pecks were required on 1 or both keys, the total pecks emitted was not; the change from a 1-key to a 2-key requirement simply moved some pecks from 1 key to the other. Thus, each peck preceding the 1 that produced the reinforcer contributed independently to the subsequent rate of responding; the contribution of a particular peck in the sequence was determined by the time between its emission and the delivery of the reinforcer (delay of reinforcement), and was identified by the proportion of pecks moved from 1 key to the other when the response requirement at that point in the sequence was moved from one key to the other. (33 ref.)—*Journal abstract.*

6437. D'Andrea, Thomas. (Haverford Coll.) **Avoidance of timeout from response-independent reinforcement.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 319-325.—Responses on a lever by 3 Sprague-Dawley male rats postponed scheduled time-outs, or periods during which the delivery of response-independent food was withheld. The effects of a number of experimental variables were examined and the conclusions drawn that (a) the functional relations describing free-operant avoidance of time-out from response-independent reinforcement are similar to those for avoidance of electric shock, and (b) both phenomena are sensitive to the same parametric manipulations. Results suggest that high frequency of food delivery in time-in maintains a higher rate of time-out avoidance than low frequency. The evidence argues against an interpretation in terms of adventitious food-reinforcement of the time-out avoidance response. The effects of scheduling time-outs independently of responding, and of omitting time-outs, confirm the view that time-outs can be aversive and may act as punishment for responding. (21 ref.)—*Journal abstract.*

6438. Jernstedt, G. C. (Dartmouth Coll.) **Joint effects of pattern of reinforcement, intertrial interval, and amount of reinforcement in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 421-429.—Observed the joint effects of patterns of reinforcement, large and small amounts of reinforcement, and massed and spaced trials on acquisition and both initial and terminal extinction. 96 male Sprague-Dawley albino rats served as Ss. Greater total numbers of nonreinforcements produced greater resistance to extinction, particularly early in extinction. Massed trials produced greater resistance to extinction than spaced trials, but only later in extinction. Large amounts of

reward resulted in more resistance to extinction than small amounts for partially reinforced Ss, but the opposite for continuously reinforced Ss. A 3-way interaction between pattern, amount, and ITI was not found. It is concluded that the main effects and interactions are best explained by a frustration mechanism. (18 ref.)—*Journal abstract.*

6439. Lee, Julia K. & Gollub, Lewis R. (Henry Ford Hosp., Detroit, Mich.) **Second-order schedules with fixed-ratio components: Variation of component size.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 303-310.—Reinforced key pecking by 2 adult male white Carneaux pigeons with food under 2nd-order schedules with fixed-ratio units. A constant total number of key pecks was required for reinforcement under each condition, but the size and, inversely, number of fixed-ratio components were varied. The total response requirement of 256 pecks was divided into fixed-ratio units of 128, 64, 32, 8, and 2 responses. A brief stimulus, which always preceded food reinforcement, was presented upon completion of each fixed-ratio unit. Under most conditions, the pattern of within-unit responding was typical of that under simple fixed-ratio schedules. Overall response rate was an inverted U-shaped function of component size. This relationship is consistent with previous determinations of rate as a function of fixed-ratio value for simple fixed-ratio schedules.—*Journal abstract.*

6440. McMillan, John C. (U. North Carolina, Chapel Hill) **Percentage reinforcement of fixed-ratio and variable-interval performances.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 297-302.—Replaced 20-70% of the reinforcements scheduled for pigeons' fixed-ratio 80 performances by a 4-sec timeout. Ss were 4 adult male white Carneaux pigeons. Pauses after reinforced ratios were unchanged at 80% reinforcement, but were lengthened at lower reinforcement percentages. Pauses after nonreinforced ratios were shorter than postreinforcement pauses. When 50% of the reinforcements arranged by a variable-interval 60-sec schedule were replaced by a 4-sec time-out, pauses after reinforcement omission increased. Both frustrative nonreward and reinforcement aftereffects notions can explain the fixed-ratio results; neither easily explains the variable-interval data. *Journal abstract.*

6441. Padilla, A. M. (State University Coll. New York, Potsdam) **Analysis of incentive and behavioral contrast in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 464-470.—Trained 10 male Holtzman albino rats to shuttle freely in 2 parallel runways. Ss were reinforced in both runways on 1 of 2 variable-interval (VI) schedules of reinforcement (VI 1.5 min. or VI 3.75 min.) and with 1 of 2 reward magnitudes (2 or 5 pellets). After performance had stabilized, the VI schedule in 1 of the runways was shifted to the other schedule. The contrasted condition continued for 8 sessions, after which the base-line schedule was reinstated for another 12 sessions. The magnitude of reinforcement was then contrasted. Response rate and 1 measure of latency following each of the shift phases showed contrast effects. A perceptual-motivational interpretation is offered to explain the findings.—*Journal abstract.*

6442. Pear, Joseph J. & Wilkie, Donald M. (U. Manitoba, Winnipeg, Canada) **Contrast and induction in rats on multiple schedules.** *Journal of the Ex-*

Experimental Analysis of Behavior, 1971(May), Vol. 15(3), 289-296. Trained 8 male Holtzman albino rats on a variable-interval schedule in the presence of a light (Phase I). Responding was then extinguished in the presence of darkness that alternated with the light (Phase II). Reinforcement was then introduced in the presence of darkness (Phase III). Several Ss were then returned to the condition of Phase II (Phase IV) and then to that of Phase III (Phase V). Most Ss' responses showed clear behavioral contrast in Phase II, i.e., an increase in responding in the presence of the light. When, for 3 Ss, Phase III was introduced early after the occurrence of positive contrast, either positive induction occurred (i.e., an increase in responding in the presence of the light, or there was little change. Negative contrast did not occur. It was shown that positive contrast dissipates over time, thus replicating a result previously obtained with pigeons and that the positive induction effect seems also to dissipate over time. The introduction of reinforcement in the presence of darkness (Phases III and V) after the dissipation of positive contrast seemed to have little consistent effect. (17 ref.)—*Journal abstract*.

6443. Sheldon, M. H. (U. Newcastle upon Tyne, England) Stimulus functions in some chained fixed-ratio schedules of reinforcement. *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 314-317. Compared behavior for 2 male pigeons in equivalent 2-link chained and tandem schedules in which 100 responses were required for food reinforcement but responses required in the 2 links of the chained schedule were varied over the values 2-98, 50-50, and 98-2. Initial pausing, response rate in each link, and the total time to complete each ratio were recorded. In chained components, initial-link pausing (for both Ss) and total time to complete the ratio (for 1 S) were generally shorter when the response requirement was 2-98 than when it was 50-50 or 98-2; for terminal-link pausing this relationship was reversed for both Ss. There were also systematic changes in behavior in tandem components, and in the relationship between behavior in chained and tandem components. Results are discussed in terms of conditioned reinforcement.—*Journal abstract*.

6444. Traupmann, Kenneth L., Wong, Paul T., & Amsel, Abram. (U. Texas) Durability of persistence as a function of number of partially reinforced trials. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 372-375. Gave 30 Holtzman male albino rats asymptotic CRF training. Ss were then given either 0 (PR-0), 4 (PR-4), or 32 (PR-32) partially reinforced (PRF) runway trials with multiple-pellet reward. While a partial reinforcement extinction effect (PREE) was shown in both the PR-32 and PR-4 groups, the effect was much greater in the former. Following asymptotic extinction training, all groups were subjected to CRF reacquisition and a 2nd extinction. The PREE reemerged in the extinction of the PR-32 but not of the PR-4 group. Results are compared with some earlier ones on partial delay of reward (PDR) and the comparison suggests an explanation in frustration-theoretic terms for durable persistence in the PRF case but not in the PDR case.—*Journal abstract*.

6445. Zimmerman, Donald W. (Carleton U., Ottawa, Ontario, Canada) Rate changes after unscheduled omission and presentation of reinforcement. *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 261-270. Studied changes in response rate similar to frustration effects in 4 Sprague-Dawley male

albino rats in a 2-lever situation. Responding on 1 lever on a fixed-interval schedule produced access to water for 5 sec. and an exteroceptive stimulus. In the presence of this stimulus, responding on another lever on a fixed-interval schedule produced access to water for 5 sec. and terminated the stimulus. Occasional omission of a previously scheduled reinforcer after responding on the 1st lever resulted consistently in increases in rate on the 2nd lever during the immediately succeeding interval. In another procedure occasional presentation of a previously unscheduled reinforcer after responding on the 1st lever resulted consistently in decreases in the rate of the 2nd lever during the immediately succeeding interval. Changes occurred after the 1st omissions or presentations and were about the same in magnitude as the procedure continued over several sessions. Typically, an increase or decrease in rate was maintained throughout an entire 100-sec interval. Changes in rate on the 2nd lever of approximately the same magnitude also occurred when rate on the 1st lever was near 0 under a schedule that differentially reinforced behavior other than lever pressing. (15 ref.)—*Journal abstract*.

Punishment & Extinction

6447. Koteskey, Ronald L., & Hendrix, M. Michael. (Ashbury Coll.) Increased resistance to extinction as a function of double and single alternation and of subsequent continuous reinforcement. *Journal of Experimental Psychology*, 1971(Jun), Vol. 88(3), 423-428. Proposes a stimulus sampling model to account for the increased resistance to extinction following partial reinforcement. 50 Holtzman albino male rats were divided into 5 groups: (a) double alternation, followed by single alternation, followed by CRF; (b) double alternation only; (c) single alternation, followed by CRF; (d) single alternation only; and (e) CRF only. Each group was given a total of 212 acquisition trials. Groups given double alternation showed greater resistance to extinction than those given single alternation, and the groups given CRF were more resistant to extinction than those continued on partial reinforcement. 5 out of 6 predictions made by the model were confirmed. Results are interpreted as generally supporting the model.—*Journal abstract*.

6448. Likely, David; Little, Lydia, & Mackintosh, N. J. (U. New Brunswick, Fredericton, Canada) Extinction as a function of magnitude and percentage of food or sucrose reward. *Canadian Journal of Psychology*, 1971(Apr), Vol. 25(2), 130-137. 64 male hooded rats and 8 groups were trained to run an alleyway and extinguished. For groups given food rewards, extinction performance was dependent on an interaction of the magnitude and percentage of reward in acquisition. Consistently reinforced Ss, large rewards led to slower running in extinction, but in partially reinforced Ss, large rewards led to faster running. With sucrose as the reward, however, large rewards (higher concentration) led to faster running in extinction irrespective of the schedule of reinforcement. These differences between food and sucrose are discussed in terms of frustration theory and sequential theory. The simplest interpretation, within the context of sequential theory, is to assume

that different concentrations of sucrose, although differing in their reinforcing effects, do not produce discriminably different aftereffects. (French summary) (21 ref.).—*Journal summary*.

(Monash U., Clayton, Victoria, Australia) **Sensory stimulation of the human fetus.** *Australian Journal of Mental Retardation*, 1970(Jun), Vol. 1(2), 63-64.—Experimental work in animals suggests that stimulation of fetal nervous pathways may relate to the development of the brain. The fetal environment is probably one of sensory deprivation. This was investigated experimentally by inserting a microphone into the uterus of several pregnant women. Specific sounds and levels were generated by placing a source of pure tone frequency on the abdominal wall. Sound loss was appreciable, and the fetus did not receive high frequency signals. Sound stimulation of the fetus did produce changes in the heart rate and muscular activity. The effect on the nervous system is not known.—C. L. Nicholson.

INFANCY

6469. Brockman, Lois M. & Ricciuti, Henry N. (U. North Dakota) **Severe protein-calorie malnutrition and cognitive development in infancy and early childhood.** *Developmental Psychology*, 1971(May), Vol. 4(3), 312-319.—Observed the effects of severe protein-calorie malnutrition during infancy on cognitive development. 20 protein-calorie deficient 11.8-43.5 mo. old children and 19 controls without a history of malnutrition were tested with 10 different sorting tasks. Following 12 wk. of further nutritional treatment the experimental Ss were retested. Analysis of the total test scores indicate that malnourished Ss performed significantly lower than controls, and the younger Ss (< 24 mo.) lower than the older (> 24 mo.) Ss. On retest, the malnourished Ss showed no significant increase in test scores. Test scores of experimental Ss were correlated negatively with all body measure percentages at admission, and positively with changes in body length and head circumference percentages between admission and 1st testing, length of time in nutritional treatment, and medical ratings of nutritional recovery. (15 ref.) *Journal abstract*.

6470. Eimas, Peter D., Siqueland, Einar R., Jusczyk, Peter, & Vigorito, James. (Brown U.) **Speech perception in infants.** *Science*, 1971(Jan), Vol. 171(3968), 303-306. Studied discrimination of synthetic speech sounds in 1- and 4-mo-old infants (32 male and female experimental Ss and 20 controls). The speech sounds varied along an acoustic dimension previously shown to cue phonemic distinctions among the voiced and voiceless stop consonants in adults. Discriminability was measured by an increase in CR rate to a 2nd speech sound after habituation to the 1st speech sound. Recovery from habituation was greater for a given acoustic difference when the 2 stimuli were from different adult phonemic categories than when they were from the same category. The discontinuity in discrimination at the region of the adult phonemic boundary was taken as evidence for categorical perception. —*Journal abstract*.

6471. Littenberg, Ronnie; Tulkin, Steven R., & Kagan, Jerome. (Harvard U.) **Cognitive components of separation anxiety.** *Developmental Psychology*, 1971(May), Vol. 4(3), 387-388.—Each of 24 11-mo-old infants watched his mother leave him from an exit in the home that was either normally or rarely used by the mother. The incidence of crying, staring, and crawling to the exit was greater when the mother left by the unfamiliar exit. Results suggest that cognitive components are a factor in the phenomenon of separation anxiety. —*Journal abstract*.

6472. O'Grady, Roberta S. (Orange County Medical Center, Calif.) **Feeding behavior in infants.** *American Journal of Nursing*, 1971(Apr), Vol. 71(4), 736-739.—Describes the infant's feeding behavior in 5 behavioral steps: prefeeding, approach, attachment, consummatory, and satiety. Nurses are 1st to see the infant's spontaneous and reflex behavior become shaped by the mother's behavior. These behaviors are cues to the kind of relationship which is developing between mother and

infant. How these cues can be utilized is discussed. A healthy pattern of feeding behavior in infancy is stimulated and nurtured by consistent predictable events in which the infant learns to associate hunger tension with pleasurable relief, to experience varieties of taste and texture, to attempt mastery of self-feeding skills, and to explore the properties of foods and eating utensils. It is concluded that the behaviors of a mother and child should be observed by child care workers in order "to encourage or promote healthy interactions."—S. R. Diamond.

6473. Rheingold, Harriet L., & Eckerman, Carol O. (U. North Carolina, Chapel Hill) **The infant separates himself from his mother.** *Science*, 1970(Apr), Vol. 168(3927), 78-83.—Discusses (a) the detachment of an infant from his mother in humans and in several primate species, (b) the psychological and biological consequences of this detachment, and (c) the relationship of this behavior to current principles of behavior theory. 2 studies involving human infants and children are reviewed to show that this behavior lends itself to experimental analysis. Exp. I was conducted in a seminaturalistic setting and involved 48 1-5 yr. old children. Exp. II was conducted in a laboratory with 24 10-mo-old infants. It is concluded that detachment (a) increases opportunities for learning on the part of the infant, (b) can be readily experimentally manipulated, and (c) lends itself to comparisons between species. (28 ref.)—P. McMillan.

6474. Salk, Lee. (Cornell Medical Center, New York Hosp., New York, N.Y.) **The critical nature of the post-partum period in the human for the establishment of the mother-infant bond: A controlled study.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 110-116. Examined the question of whether postpartum separation of mother from her newborn infant has any effect on mother's response to her infant, noting that from general observations, it seems natural for mothers with normal infants to hold them on their left side. 115 mothers who had experienced long postpartum separation and 286 mothers who did not were compared as to how they held their infants and questioned by an E. Results suggest that prolonged postpartum separation (at least 24 hr.) alters the mother-infant response, suggesting that the time immediately postpartum is critical for releasing a certain maternal response stimulated by holding the infant. This reaction was also noted in Ss who had other children. There also seemed to be as much alteration in maternal response following short as well as long periods of separation. (28 ref.)—P. Hertzberg.

CHILDHOOD

6475. Chase, H. Peter & Martin, Harold P. (U. Colorado, Medical School, Denver) **Undernutrition and child development.** *New England Journal of Medicine*, 1970(Apr), Vol. 282(17), 933-939.—Compared 19 children who had been hospitalized with undernutrition in the 1st yr. of life with a control group 3-4 yr. later. The test group was found to be lower in height, weight, head circumference, and developmental quotient. Impairment of physical and mental development appeared to correlate with the duration of undernutrition in the 1st yr. of life. 9 children admitted to the hospital with undernutrition but treated in the 1st 4 mo. of life now have a mean developmental quotient of 95, which is

similar to the mean of 99 for the control children. In 10 with undernutrition after 4 mo. of age low indexes for height, weight, and head circumference were more frequent, and the mean developmental quotient was 70. Social factors associated with undernutrition included paternal separation, alcohol-related problems, inadequate money, and many young siblings. (23 ref.)—*Journal abstract.*

Germany) **Zur Konditionalanalyse des kindlichen Entscheidungsverhaltens.** [Conditional analysis of decision behavior during childhood.] *Zeitschrift für Psychologie*, 1970, Vol. 177(3-4), 250-285.—Extending the research work of H. D. Schmidt concerning the behavior of children in decisive situations, child behavior is examined, depending on cognitive variables. 47 3-6 yr. olds and 49 4-8 yr. olds, about evenly divided between boys and girls, were examined. Below average, average, and above average IQs were used in order to determine the decision genetics in their dependence on cognitive conditions. Experiments were made in change-dependent situations, and little rewards, e.g., chocolate, marbles, were offered. A succession of decision strategies over the probability aspect (understood as "security") was found to be the tendency: behavior promising material gain was more strongly expressed than behavior promising security. The experiments indicate a correlation of the cognitive conditions in ontogenesis with the risk calculation covering a larger series of decisions. As the results of the experiments were not decisive, further differentiated examinations of the risk problem are recommended. (34 ref.)—*P. von Toal.*

Górecka, Alicja K. **Badanie nad rozwojem bezpośredniej pamięci dzieci.** [Studies of the development of immediate memory in children.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 87-104.—Tested 300 3rd-8th grade children with 3 stories. Each story was followed by a list of questions concerning 40 details of story content. Relationships between scores, sex, grade, age, and education of parents were examined. Data indicate that (a) memory develops with age, (b) the greatest development of memory occurs in the 4th-6th grade, and (c) Ss with educated parents performed significantly better than Ss with less educated parents. No sex differences were noted. An explanation for the differences between the results of this study and others on memory is presented. (Russian summary)—*English summary.*

6491. Graham, David M. (U. Toronto, Ontario, Canada) **Acquisition of an instrumental response in young children under various conditions of reinforcement.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5022-5023.

6492. Heider, Eleanor R. (Brown U.) **"Focal" color areas and the development of color names.** *Developmental Psychology*, 1971(May), Vol. 4(3), 447-455.—Tested a possible developmental basis for the universality of focal colors, those areas of the color space previously found to be the most exemplary of basic color names in many different languages. It was hypothesized that focal colors are more "salient" than nonfocal colors

for young children and are the areas to which color names initially become attached. In Exp. I, 24 3-yr-olds picked any color they wished from sets of focal and nonfocal colors to show to the E. In Exp. II, 20 4-yr-olds tried to pick colors that matched focal and nonfocal color samples. In Exp. III, 27 3-4 yr. olds chose colors to represent each basic color name from arrays containing focal and nonfocal examples of the color. Focal colors were (a) more frequently shown to the E, (b) more accurately matched, and (c) more frequently chosen to represent the color name than were nonfocal colors. Implications for the learning of semantic reference are discussed.—*Journal abstract.*

6493. Hill, Kennedy T. & Watts, Graeme H. (U. Illinois) **Young children's performance on a two-choice task as a function of social reinforcement, base-line preference, and response strategy.** *Developmental Psychology*, 1971(May), Vol. 4(3), 487-488.—Investigated methodological problems and analyzed response strategies (e.g., repetition and response shifting) in a 2-choice learning task used in studies of social reinforcement in children. 24 4-yr-olds were selected on the basis of the strength of their response preferences during a 25 trial base-line period. Ss were then assigned to a reinforcement condition which supplied social reinforcement or nonreinforcement for the less preferred choice. Strong preference Ss under social reinforcement showed a strong change towards the less preferred choice, while weak Ss showed little change. Response strategies did not change. Under nonreinforcement no changes were noted from the base-line period. It is concluded that the response tendencies and strategies were the primary determinants of preference under both conditions of reinforcement.—*S. Knapp.*

6494. Jensen, Larry C., Harris, Kenneth, & Anderson, D. Chris. (Brigham Young U.) **Retention following a change in ambient contextual stimulus for six age groups.** *Developmental Psychology*, 1971(May), Vol. 4(3), 394-399.—144 male and 144 female students attending Grades 2, 4, 6, 8, 10, and 12 serially learned a list of 8 nonsense syllables. All Ss were tested for retention after 24 hr. The ambient contextual stimuli were markedly altered during the recall session. $\frac{1}{2}$ the Ss recalled in the same room used during original learning and the others changed rooms. Data were analyzed with a 3-way analysis of variance and covariance. Results indicate that (a) older Ss learned more rapidly but did not recall better, (b) contextual change impaired retention across age levels, and (c) females were slightly superior to males in recall but not in acquisition. (23 ref.)—*Journal abstract.*

6495. Keogh, Barbara K. & MacMillan, Donald L. (U. California, Los Angeles) **Effects of motivational and presentation conditions on digit recall of children of differing socioeconomic, racial, and intelligence groups.** *American Educational Research Journal*, 1971(Jan), Vol. 8(1), 27-38.—Investigated relationships between IQ, racial-socioeconomic status, and children's performance on digit recall tasks under 2 motivation conditions, intrinsic and extrinsic, and 3 presentation conditions, immediate recall, delayed recall, and repetition. IQ and method of presentation were significantly related to performance in digit recall. The triple interaction of Motivation \times IQ \times Presentation Condition was also significant. Repeated presentation of digits led to the best performance in all groups. Racial-socioeconomic status was not related to the presentation

condition. It is concluded that motivation should be considered when generalizing about learning aptitudes and abilities of children from varied intellectual, ethnic, or socioeconomic backgrounds.—*E. J. Mason.*

6496. Kossuth, Gina L., Carroll, Wayne R., & Rogers, Cecil A. (U. Arizona) **Free recall of words and objects.** *Developmental Psychology*, 1971(May), Vol. 4(3), 480.—Assessed free recall effects of spatial groupings of unrelated words and their object referents, 80 normal intelligence 6th graders, assigned to 4 groups served as Ss. $\frac{1}{2}$ the Ss were presented words and $\frac{1}{2}$ the object referents of the words. $\frac{1}{2}$ of each group then verbally labeled the materials while the other $\frac{1}{2}$ did not. "Findings suggest that spatial grouping may serve as a basis for organization of words and objects." Objects produced better clustering and recall than words, while labeling did not facilitate recall and clustering, probably due to interference in covert labeling and rehearsal strategies.—*S. Knapp.*

6497. Levin, Joel R., Rohwer, William D., & Cleary, T. Anne. (U. Wisconsin) **Individual differences in the learning of verbally and pictorially presented paired associates.** *American Educational Research Journal*, 1971(Jan), Vol. 8(1), 11-26.—Investigated individual differences in recalling various types of presented materials in a mixed-list, paired-associate (PA) learning study. Within samples of children from different grades (kindergarten, 1st, and 3rd) and socioeconomic-racial groups, stimulus preferences were observed that could be accounted for by the presentation mode of the materials: verbal or pictorial. Furthermore, the administration of a parallel form of the PA task indicated that individual item-type preferences were relatively stable. Interpretive precautions and suggestions for future use are included. (23 ref.)—*Journal abstract.*

6499. May, Richard B. & MacPherson, David F. (U. Victoria, British Columbia, Canada) **Size discrimination in children facilitated by changes in task difficulty.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 453-458.—Conducted 2 experiments with 138 5-9 yr. old primary school children on size discrimination. Groups of Ss given easy and then medium difficulty levels of the task subsequently performed better on a difficult level than Ss receiving all their training on the difficult discrimination. Groups given the same easy and medium discriminations in other orders performed better than either graduated easy-medium-hard or control groups. It is argued that number of stimulus changes in problem difficulty is a major factor influencing transfer along a continuum.—*Journal abstract.*

6500. Moely, Barbara E. & Shapiro, S. I. (U. Hawaii) **Free recall and clustering at four age levels: Effects of learning to learn and presentation method.** *Developmental Psychology*, 1971(May), Vol. 4(3), 490.—Tested 144 3-7 yr. old children on recall of 30 pairs of line drawings in experimental vs. control groups with block vs. random presentations. Age, list type, presentation method, and sessions were significant for recall and clustering. Recall increased with age and was consistently higher for the category blocked condition. Clustering increased with age with block presentation. Performance did not differ, however, for the block vs.

random control conditions indicating that presentation as such has little effect on overall clustering. Results indicate a learning to learn effect for recall and clustering, but since no interactions were found between sessions and list type, it is concluded that such effects are not dependent on conceptual relations.—S. Knapp.

6506. Berzonsky, Michael D. (Edinboro State Coll.) **Interdependence of Inhelder and Piaget's model of logical thinking.** *Developmental Psychology*, 1971(May), Vol. 4(3), 469-476. Administered measures of physical causality, tests of hypothesized component abilities of causal reasoning, Piagetian concrete operational tasks, 2 of B. Inhelder and J. Piaget's problem-solving tasks, and an intelligence measure to 42 male and 42 female 1st graders. Results, analyzed by submitting the intercorrelation matrix of 30 variables to a maximum likelihood factor analysis with a varimax rotation, indicate 5 factors. The 1st factor, causal reasoning, included 2 verbal criteria of physical causality and 5 hypothesized component abilities. 2 of the other 4 factors were identified as problem solving and operational thought, on which 5 Piagetian tasks loaded. Results fail to support the unitary nature of logical thinking postulated by Inhelder and Piaget. It is suggested that at least 3 relatively independent abilities are involved. (24 ref.)—*Journal abstract*.

6507. Blank, Marion & Frank, Sheldon M. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Story recall in kindergarten children: Effect of method of presentation on psycholinguistic performance.** *Child Development*, 1971(Mar), Vol. 42(1), 299-312.—Devised a story-retelling task as a means of testing syntactic and semantic aspects of language performance in 34 kindergartners. 2 groups of Ss were matched for age, IQ, and ethnic background (Negro, Puerto Rican, and white Ss in each group). Syntactic recall was reduced in amount and varied in pattern from the commonly used single sentence imitation task. Several factors appeared to be responsible, including such variables as semantic content and "stress" (the need to retain large amounts of information). Linguistic performance, including both semantic and syntactic recall, was enhanced by varying the method of presentation so that S was required to play a more active role in the situation. In addition to the method of presentation, intelligence was found to

influence performance in that Ss with higher MAS showed significantly better recall. (16 ref.)—*Journal abstract*.

Colorado, Inst. for the Study of Intellectual Behavior) **Chronological age and performance on problems with repeated presolution shifts.** *Developmental Psychology*, 1971(May), Vol. 4(3), 329-333.—Tested a dimension-selection theory of concept identification, following procedures used by T. Trabasso and G. Bower (see PA, Vol. 40:4732). 26 1st, 3rd, 5th, 7th grade, and college-aged males solved a single problem involving repeated reversal shifts, repeated dimensional shifts, a simple unidimensional concept, or a concept with 2 redundant relevant dimensions. Discrepancies between data (informed errors to solution) and theory changed with age, increasing to a maximum at Grades 3 and 5 and decreasing to a pattern reported by Trabasso and Bower for adults. It is concluded that dimension selection (or hypothesis testing) might depend on the prior acquisition of simpler skills (e.g., coding) which are unavailable to younger Ss.—*Journal abstract*.

6526. Tyszkowa, Maria. Analiza rozwiązywania trudnych zadań (problemów) przez dzieci szkolne. [An analysis of school children's solving of difficult problems.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 71-86.—Analyzed the psychological structure of activities connected with the solving of difficult mathematical problems by 9-13 yr. old schoolchildren. It was found that during the process of solving difficult problems the elements of orientation expanded. The attempts by the younger Ss to solve problems by trial and error is interpreted as a return to the initial orientation phase. The formation and internal evaluation of ideas on how to solve the problems was often prolonged, particularly in the older Ss. Control and evaluation activities were rarely noted. Older Ss exhibited a marked tendency to abandon attempts at solution of problems they could not solve, whereas younger Ss persevered with trial and error methods. (Russian summary)—English summary.

6527. Watt, Norman F. (U. Massachusetts) Developmental changes in semantic interpretation of ambiguous words. *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 332-339.—Administered homograph measures of vocabulary and semantic interpretation to 81 7th grade and 85 12th grade children to test for patterns of developmental change in language. Developmental progressions were found for enlargement of abstract vocabulary and reduction of biases toward primary (common) and concrete errors of interpretation in sentence contexts. Another experiment using the same measures found a loss of abstract vocabulary in aphasics and a trend toward excessive primary bias in schizophrenics. However, on all other measures of vocabulary and semantic interpretation the mental patients did not perform like the younger Ss in this experiment. Results do not support conceptions of linguistic regression in psychopathology.—Journal abstract.

6529. Williams, Robert. (Nativity Parish, Hollywood, Fla.) A theory of God-concept readiness: From the Piagetian theories of child artificialism and the origin of religious feeling in children. *Religious Education*, 1971(Jan), Vol. 66(1), 62-66. Piaget's stages of artificialism could serve as bases for developing a rationale for God-concept readiness and could provide criteria for introducing children to the God concept. In diffuse artificialism (to about 5-6 yr. of age) children believe nature to be under men's control and related to men's purposes, with parents regarded as all-powerful, all-knowing, divine. By the time the child is in the stage of mythological artificialism (5 or 6-7 yr. of age), he realizes the limits of human power and transfers it to God. During the period of technical artificialism (7-9 or 10 yr. of age) inquiry concerning the "how" of production leads to renunciation of belief in human omnipotence and to learning laws of reality (marked by decline in participation, artificialism, and animism). In the stage of immanent artificialism (from about 9-10 yr. of age on), the child no longer regards nature as made by men. If led to distinguish between physical and theological factors, he continues to interpret creation of the world in terms of integral artificialism, but attributes details of the phenomena to natural processes. A transitional age of 6 could serve as base from which the child might be socialized to the God concept. Relating God-concept readiness to number-concept readiness through a report of evidence, neither concept seems to be immediately enhanced by educational intervention.—S. E. Gavin.

6535. Greenberger, Ellen; O'Connor, Jeanne, & Sørensen, Annemette. (Johns Hopkins U., Center for Study of Social Organization of Schools) **Personality, cognitive, and academic correlates of problem-solving flexibility.** *Developmental Psychology*, 1971(May), Vol. 4(3), 416-424.—Tested a sample of 113 middle-class children in Grades 1-3 with questions resembling J. Guilford's "consequences" procedure. An hypothesis linking problem-solving flexibility with alertness to and interest in the environment was generally supported, more strongly for boys than for girls. Ss high in problem-solving flexibility had better recall for novel information and were rated higher in curiosity by their teachers. Boys who were high in problem-solving flexibility showed a patriarchal pattern of intrusive, active, assertive personality characteristics. The pattern for girls was somewhat more subdued, but still suggested responsiveness to novelty and diversity of experience. Problem-solving flexibility was associated (a) positively but weakly with IQ, (b) negligibly to test anxiety, and (c) positively with school achievement. (26 ref.)—*Journal abstract.*

6536. Henderson, Douglas B. & Greenwald, Anthony G. (Ohio State U.) **Two developmental tests of ideomotor theory.** *Developmental Psychology*, 1971(May), Vol. 4(3), 484-485.—Hypothesized that control over the performance of an action develops from association to an image of its own feedback, to generalization to high ideomotor-compatible stimuli, and finally to generalization to low ideomotor-compatible stimuli. 23 1st graders, 21 6th graders, and 20 undergraduates were tested in 2 tasks. Task 1 required rapid naming of digits presented (a) auditorily or (b) visually.

Task 2 required rapid naming of visually presented digits accompanied by an auditory stimulus of (c) same digit, (d) different digit, or (e) click. RTs for all ages were faster for a than b in Task 1, and slower for d than for c or e in Task 2. "The prediction of strongest effects for youngest Ss was confirmed by a significant Age Level \times Stimulus Condition interaction for each task, due chiefly to substantial enhancement of ideomotor effects for the 1st-grade age level."—S. Knapp.

6537. Hertzog, Margaret E. & Birch, Herbert G. (New York U., Medical School) **Longitudinal course of measured intelligence in preschool children of different social and ethnic backgrounds.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 416-426.—Examined the longitudinal course of measured intelligence (using the Stanford-Binet Intelligence Scale, Form L) in white middle-class and Puerto Rican working class children at 3 and 6 yr. of age. 60 Puerto Rican and 116 white Ss were examined at 3 yr., while 57 Puerto Rican and 110 of the white Ss were reexamined at 6 yr. of age. Findings suggest that stability in IQ over this time period was characteristic of both groups, with greater stability manifested by Puerto Rican than by middle-class Ss. No evidence for deterioration of IQ with age in the disadvantaged group was found. Data are considered in relation to problems of the stability of IQ and its utility in the assessment of the effects of compensatory education programs. (17 ref.)—*Journal abstract.*

6538. Klindová, Ľuba. (Research Inst. of Pedagogy, Bratislava, Czechoslovakia) **Niektoré psychologické problémy nadania vo svetle najnovších výskumov.** [Psychological problems with talented children in the light of latest research.] *Jednotná Škola*, 1970(Feb), Vol. 22(2), 145-158.—Considers the problem of talented children and briefly discusses theoretical approaches. An outline of the world literature is presented which deals with (a) the essence of talent as a psychological phenomenon, (b) the developmental characteristics of the talented, and (c) the influences of external events on talent. An ongoing research project studying the manifestations of talent in children during their preschool and 1st years of school is described. (Russian summary) *English summary.*

6539. Leithwood, Kenneth A. (Ontario Inst. for Studies in Education, Trent Valley Center, Peterborough, Canada) **Motor, cognitive, and affective relationships among advantaged preschool children.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 47-53.—Examined motor-cognitive and motor-affective relationships among 60 4-yr-old nursery school children advantaged intellectually and socioeconomically. Both simple and complex motor measures were correlated with 8 dimensions of intellectual functioning and a multidimensional scale of psychosocial adjustment. Several cognitive abilities were identified as having significant relations with motor ability. Also, twice as many significant correlations were found between intellectual measures and complex as compared with simple motor ability. Psychosocial adjustment appeared to be unrelated to either the cognitive or motor spheres. (18 ref.)—*Journal abstract.*

6540. Lurcat, Lilliane & Kostin, Irene. (Lab. of Genetic Psychology, Sorbonne, Paris, France) **Study of graphical abilities in children.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 615-630.—Administered the Lurcat Test of Graphical Abilities to 124 4-10 yr. old right-handed children. Age trends were determined for the ability to reproduce the correct form of a curve, i.e., a

cycloid or a spiral, when given (a) visual information alone, (b) both visual and kinesthetic information, and (c) kinesthetic information alone. Results for the right and left hands were determined separately. Age trends were examined, also, for the ability to reproduce the correct trajectory or orientation of these curves in the 3 above situations. Most of the development of these abilities in our sample seems to occur between 4 and 7 yr. of age. Reproducing cycloids with parallel rotations with both hands simultaneously while blindfolded seems to be related to laterality. In this situation, for 6 and 7 yr. olds, the large majority of right-handed children correctly reproduce the rotation of the cycloid only with the right hand. The rotation produced by the left hand was found to be symmetrical rather than parallel to that produced by the right hand.—*Journal abstract.*

6542. Mittler, Peter. (U. Manchester, Hester Adrian Research Center, England) **The use of morphological rules by four year old children: An item analysis of the Auditory-Vocal Automatic subtest of the Illinois Test of Psycholinguistic Abilities.** *British Journal of Disorders of Communication*, 1970(Oct), Vol. 5(2), 99-109.—Administered the Auditory-Vocal Automatic test of the Illinois Test of Psycholinguistic Abilities to 80 normal 4-yr-old children. The performance of the British children corresponded closely to that of the United States standardization sample, but the scores were strongly influenced by social class. Detailed analysis of Ss' use of morphological rules indicated that simple plurals constituted no difficulty, but that only a small proportion could produce irregular plurals. About 2/3 could form regular verbal inflections, but only about 10% could form irregulars. Regular comparatives and superlatives were produced by 1/3 of the sample, but irregular forms were rarely correct. Results are discussed in the light of the test's logical and psycholinguistic assumptions.—*Journal summary.*

6543. Moyles, E. William & Wolins, Martin. (U. California, School of Public Health, Berkeley) **Group care and intellectual development.** *Developmental Psychology*, 1971(May), Vol. 4(3), 370-380.—Compared for cognitive development several hundred children in various group care programs with children reared at home. Raven's Progressive Matrices test was administered to groups of children in residence for 2 or more yr. in Israeli kibbutz youth groups and institutions, an Austrian children's village, and Polish and Yugoslav children's homes. When compared with age-mates living with natural families, the group-reared Ss did not show any of the developmental deficiencies usually attributed to "institutional" rearing. Similarly, there was no correlation between age of entry or length of stay in a group setting and test performance. (27 ref.)—*Journal abstract.*

6557. Ciaccio, N. V. (Inst. for Juvenile Research, Chicago, Ill.) *A test of Erikson's theory of ego epigenesis*. *Developmental Psychology*, 1971(May), Vol. 4(3), 306-311. Tested the 2 basic postulates of E. Erikson's theory of ego epigenesis on a sample of 120 5-, 8-, and 11-yr-old boys. A projective instrument designed by R. Boyd (see PA, Vol. 39:4529), was administered to each group. The 1st postulate, ego stage progression with increasing age, found preliminary confirmation: Group I (5 yr. olds) was most concerned with Stages II (autonomy vs. shame and doubt) and III (initiative vs. guilt). Groups 2 and 3 showed peak interest in Stages III and IV (industry vs. inferiority issues), respectively. The 2nd postulate, that the ego develops as it meets the different crisis elements of the ego stages, was called into question. All 3 groups showed most conflict for the Stage II crisis. It is suggested that this may be the focal crisis of the 1st 5 ego stages. (16 ref.)—*Journal abstract*.

6559. Eysenck, H. J., Easting, G., & Eysenck, S. B. (U. London, England) *Personality measurement in children: A dimensional approach*. *Journal of Special Education*, 1970(Sum), Vol. 4(3), 261-268.—A scale was constructed to measure the personality dimensions, P (psychoticism), E (extroversion), N (neuroticism) in addition to an L scale for the measurement of dissimulation (lying). These scales were applied to more than 3,000 7-15 yr. old Ss. Results indicate that boys scored much higher on P than did girls as well as being more extroverted and less emotional. In the L scale, the girls had higher scores. It is felt that these scales may be of value for identifying exceptional children for the purpose of further research and outlining special educational needs.—L. M. Glidden.

6562. Koocher, Gerald P. (U. Missouri) *Swimming, competence, and personality change*. *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 275-278.—Hypothesized that increasing competence in one's environment leads to enhancement of self-esteem. Using pre- and posttest measures of the discrepancy between the ideal self and self-concept of 65 7-15 yr. old boys at a YMCA summer camp, it was found that success in learning to swim reduced the discrepancy significantly ($p < .05$). Ss who did not learn to swim, and controls who could already swim were matched to experimental Ss in age and socioeconomic status. These Ss did not experience significant changes in the ideal-self-self-concept discrepancies in either direction.—*Journal abstract*.

6563. Kuehe, James L. (State U. New York, Albany) *Comment on Berman's "Social schemas: An investigation of age and socialization variables"*. *Psychological Reports*, 1971(Apr), Vol. 28(2), 358.—Comments on the article by A. Berman (see PA, Vol. 46 Issue 4) and stresses the importance of eliminating "benchmarks" that may aid Ss in the reconstruction of stimulus displays. It is suggested that because of the difficulty in eliminating all extraneous cues, the replacement method should be reserved for studies of the effect of response sets on perceptual accuracy, and that the free-placement method be used to study population differences in schema operation.—*Author abstract*.

6564. Offendick, Thomas H. & Green, Gerald E. (Purdue U.) *Level of achievement and probability in children*. *Developmental Psychology*, 1971(May), Vol. 4(3), 486. Examined the relationship of need for achievement (n Ach) to performance on a 3-choice probability learning task in which 1 stimulus was partially reinforced and the other 2 were not. 27 upper middle-class 3rd graders were equally divided into high, medium, and low n Ach groups. The prediction that high n Ach Ss would chose the reinforcing stimulus less and make more patterned responses was confirmed. Each group differed significantly from the others, with the low group making the greater number of correct responses. The pattern of the low groups response was similar to

that which has been found in lower-class and retarded Ss.—*S. Knapp.*

6565. Pate, Robert H. & Nichols, William R. (U. Virginia) **A scoring guide for the Koppitz system of evaluating children's human figure drawings.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 55-56.—Describes a scoring sheet that can be used to evaluate a child's human figure drawing.—*H. Kaczowski.*

6566. Singer, David L. & Whiton, Mary B. (Teachers Coll., Columbia U.) **Ideational creativity and expressive aspects of human figure drawing in kindergarten-age children.** *Developmental Psychology*, 1971(May), Vol. 4(3), 366-369. Administered an M. Wallach and N. Kogan type measure of ideational creativity to 74 white kindergartners. Low ideational creativity was associated with absence of motion, facial expressiveness, and elaboration in human figure drawings of kindergarten-age children. Indexes of cognitive development and emotional disturbance derived from the figure drawings, as well as a measure of verbal IQ, were all independent of ideational creativity. Findings are interpreted in terms of a multifactor theory of the creative process: expressive freedom may be a generalized precondition for creative activity which is independent of the particular information processing and transformation operations involved. *Journal abstract.*

6567. Vroegh, Karen. (Inst. for Juvenile Research, Chicago, Ill.) **The relationship of birth order and sex of siblings to gender role identity.** *Developmental Psychology*, 1971(May), Vol. 4(3), 407-411.—Assessed the appropriateness of masculinity and femininity of 316 boys and 314 girls in preschool and in Grades 2-8 by teacher and peer ratings. Data for sex of siblings, including older siblings, of each S were recorded from school records. Data analyses indicate that neither sex of siblings nor sex of older siblings had any consistent effects upon gender identity. Possible reasons for the difference between these findings and those of earlier investigators who have reported relationships among the variables are discussed.—*Journal abstract.*

6568. White, William F. & Richmond, Bert O. (U. Georgia) **Perception of self and of peers by economically deprived black and advantaged white fifth graders.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 533-534.—Neither the concept of self nor the feelings about peers appeared to be different between 98 economically deprived black and 111 advantaged white 5th graders. Ss were administered the Self-Esteem Inventory and 12 bipolar adjectives of Osgood's semantic differential. Although the sample was small and the reading ability of some of the Ss was poor, both groups perceived the connotative meaning of "activity" as the primary characteristic of importance.—*Journal abstract.*

Social Behavior

6569. Ashear, Victor & Snortum, John R. (Claremont Graduate School, Calif.) **Eye contact in children as a function of age, sex, social and intellectual variables.** *Developmental Psychology*, 1971(May), Vol. 4(3), 479.—Tested generalizations in eye contact from adults to children and developmental changes in gaze duration. 90 preschool, kindergarten, 2nd, 5th, and 8th grade children were interviewed by a college female, who was "blind" concerning the experimental hypotheses. Recordings of interviewer's and Ss' speech patterns, records of the intervals during which the S met the interviewer's

constant gaze, and ratings of Ss on a scale of social and intellectual characteristics were analyzed. Results support the hypothesis of differential patterns of eye communication for boys and girls. There was significantly more eye contact for females while speaking but not while listening. Analysis of variance for Eye Contact \times Grade Level was significant for speaking, listening, and overall eye contact. Analysis of grade level differences indicated a significant peak in kindergarten and 2nd grades with a significant drop in the 5th grade.—*S. Knapp.*

6570. Biaggio, Angela & Rodrigues, Aroldo. (Moorhead State Coll.) **Behavioral compliance and devaluation of the forbidden object as a function of probability of detection and severity of threat.** *Developmental Psychology*, 1971(May), Vol. 4(3), 320-323. Hypothesized that (a) mild threats lead to higher behavioral compliance both under high and low probability of detection, whereas severe threats lead to high compliance only under high probability of detection; and (b) highest devaluation of the forbidden object occurs under low probability of detection and mild threat, lowest devaluation occurs under high probability of detection and severe threat, and intermediate devaluation occurs under the other 2 conditions. Results with 39 Brazilian 2nd graders were opposite to those predicted. Findings are discussed as a cross-cultural disconfirmation of hypotheses derived from cognitive dissonance theory. *Journal abstract.*

6571. Bryan, James H. (Northwestern U.) **How adults teach hypocrisy.** *Psychology Today*, 1969(Dec), Vol. 3(7), 50-52, 65. A series of experiments were conducted with children exposed to a consistent adult model (preached and practiced either charity or greed) or an inconsistent model (preached the opposite of what he practiced). Results indicate that children tend to behave in the manner which the adult adopts regardless of what the model says. Conversely, if the model preaches charity, the children are attracted to him no matter what he does. Apparently 9-yr-old children do not believe that behavior should be consistent with moral exhortations. The children also had some difficulty remembering how the inconsistent models did behave.—*E. J. Posavac.*

6574. Dubanoski, Richard A. & Parton, David A. (U. Hawaii) **Effect of the presence of a human model on imitative behavior in children.** *Developmental Psychology*, 1971(May), Vol. 4(3), 463-468.—Investigated the effects of model presence on imitative behavior in 81 kindergarten and 1st grade girls and 90 preschool and 2nd grade boys and girls. In 2 main conditions, Ss either watched events performed by a model (model condition) or performed in the absence of a model (model absent condition). Although more imitation occurred in the model condition, considerable imitation was exhibited in the model absent condition. Results indicate that the presence of the model facilitates the performance of imitation and that in an experimental setting much imitation can be accounted for by mere observation of

those events which define the imitative responses.
—*Journal abstract.*

6575. Dubanoski, Richard A. & Parton, David A. (U. Hawaii) **Initiative aggression in children as a function of observing a human model.** *Developmental Psychology*, 1971(May), Vol. 4(3), 489.—Investigated (a) whether a model exhibiting aggressive responses facilitates the performance of aggressive imitative responses in Ss compared to observation alone, and (b) whether the facilitative effect of the model can be attributed to its disinhibitory function. 20 male and 20 female preschool children were assigned to 1 of 2 groups. Group 1 observed a 9-yr-old male model perform 6 different aggressive acts, and Group 2 observed the same events without the model. Group 1 showed significantly more aggressive responses than Group 2. The possible disinhibition effect of the model was examined and no support was found. It is suggested that the model facilitates the acquisition of aggressive imitative responses by eliciting closer attention or covert labeling of the events.—S. Knapp.

6576. Egsgaard, J. Børn, der isolerer sig. [Children who isolate themselves.] *Skolepsykologi*, 1970, Vol. 7(1), 41-48.—Describes normal development in contact. Such symptoms are shyness, anxiety for contact, selective mutism, and autism are discussed in relation to school-children.—P. Mylov.

6577. Emmerich, Walter; Goldman, Karla S., & Shore, Roy E. (Educational Testing Service, Princeton, N.J.) **Differentiation and development of social norms.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 323-353.—Conducted a cross-sectional study on shared beliefs on how the self should act toward others (norms) in 680 middle-class 8-17 yr. olds. Ss judged the normative import of statements differing in (a) behavioral content, (b) sources, and (c) objects. Behavioral contents were differentiated similarly at all ages, but age- and sex-role normative differentiations of sources and objects exhibited marked developmental trends, often generalizing across behavioral contents. During middle childhood, higher standards were expected in relationships with parents than with peers, irrespective of source, whereas during adolescence this differentiation was reversed for attributions to sources within the S's generation. Sex-role norms were strongly sex typed during middle childhood, a pattern that decreased during later childhood and adolescence. Related developmental shifts occurred in choices of identification models, indexed by convergences between norms held by the self and those attributed to other sources. Certain developmental trends were accelerated in brighter subgroups. Findings are related to theories of normative development, including analyses of social learning, cognitive complexity, and cognitive structure. (39 ref.)—*Journal abstract.*

6578. Haskett, Gary J. (U. North Carolina, Chapel Hill) **Modification of peer preferences of first-grade children.** *Developmental Psychology*, 1971(May), Vol. 4(3), 429-433.—Evaluated the effects of 6 kinds of social interaction on peer preference among 54 male and 52 female 1st graders. Social interaction varied in type of pairing (opposite or same sex) and extent of peer interaction (cooperation, spatial contiguity, or normal classroom control). Results of pretreatment peer rankings indicate that Ss preferred same-sex peers as friends. Preference-change scores, obtained by comparing pre- and posttreatment peer rankings, were analyzed

by analysis of covariance. Treatment and pairing-by-treatment effects were statistically reliable. Evaluation of adjusted preference-change scores indicate that cooperative interaction significantly increased preference for opposite-sex peers ($p < .01$), but not for same-sex peers. Spatial contiguity appeared to have no effect on peer preference. Results are discussed in terms of a predictability hypothesis, a deprivation-satiation effect, and a change in the discriminative properties of opposite-sex peers.—*Journal abstract.*

6582. Mock, Ronald L. & Tuddenham, Read D. (Alameda County Child Development Service, Oakland, Calif.) **Race and conformity among children.** *Developmental Psychology*, 1971(May), Vol. 4(3), 349-365.—Examined the relationship between susceptibility to group pressure and the racial composition of small groups. Ss were 280 4th, 5th, and 6th graders, divided evenly by sex and by race. Ss in groups of 5 made perceptual judgments, using apparatus which in successive phases of the experimental run distorted to specified degrees the judgments allegedly coming from others in the group. The racial, but not the sexual, composition of the groups was systematically varied, as was the E's race. Negro Ss showed more conformity than whites, and girls more than boys. A white E induced more conformity than did a Negro E. Conformity among both Negroes and whites increased as the number of white Ss in the groups increased. (19 ref.)—*Journal abstract.*

6585. Rychlak, Joseph F. (Purdue U.) **Personality factors in self- and peer-evaluations of WISC performance intelligence among middle-class children.** *Journal of Special Education*, 1970(Sum), Vol. 4(3), 269-277.—112 middle-class children (60 boys, 52 girls) were given 4 subtests of the WISC Performance scale, then asked to evaluate their performances. Following this, all children selected one another on the basis of presumed competence on WISC-like tasks. Although prorated WISC IQ did not correlate extensively with personality, there were several correlations between S's tendency to overestimate his performance and personality patterns of dominance, individuality, social competency, and ego strength. The reputational images of Ss considered talented by their peers were not as clear-cut in personality trends as in intellectual trends. The

brightest children of the sample had personalities typified by weaker self-images and lower ego strengths than the 2nd-brightest children.—*Journal abstract.*

6586. Staffieri, J. Robert & Bassett, John E. (St. Elizabeth's Child Development Center, Portland, Me.) **Birth order and perception of facial expressions.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 606.—Investigated whether later-born children are more accurate than 1st borns in recognizing facial expression of mood. 228 10- and 11-yr-old children were presented 32 pictures in 4 sets of 8 showing different mood expression on adult and child male and female figures. Results indicate no significant differences in accuracy of recognition of expression between S groups.—*P. Hertzberg.*

Parent-Child & Family Relations

6589. Aldrich, C. Knight. (New Jersey Coll. of Medicine & Dentistry, Newark) **Theft: Expect a boy to steal and he won't disappoint you.** *Psychology Today*, 1971(Mar), Vol. 4(10), 66-69.—Clinical evidence suggests that the expectation that a person will misbehave is often accompanied by subtle cues prompting the supposedly feared behavior. At times the entire subculture may hold expectations of delinquent behavior. Since some parents also secretly wish they could act out their aggressive and sexual impulses, they reinforce the behavior they verbally castigate. In order to overcome the present hostility between the generations it is necessary to stop treating minor problems as if they will necessarily lead to serious antisocial acts and to replace current pessimism with optimism about the next generation.—*E. J. Posavac.*

6590. Besdine, Matthew. **Mrs. Oedipus has daughters, too.** *Psychology Today*, 1971(Mar), Vol. 4(10), 62-65.—Male and female geniuses often experience very intense mothering as infants and children. Extraordinary females often possess "an unresolved but inverted Oedipal problem in which she feels more like a boy than a girl and remains attached to the mother in a fusion of love and hate. She lusts for the mother." Tentatively, then, it seems that very intense mothering is "a necessary, though not sufficient, condition for both male and female geniuses to develop."—*E. J. Posavac.*

6591. Burger, Gary K. & Armentrout, James A. (St. Louis U.) **A factor analysis of fifth and sixth graders' reports of parental child-rearing behavior.** *Developmental Psychology*, 1971(May), Vol. 4(3), 483.—Extended results of prior factor analyses of the responses of 7th and 8th graders and young adults to the Child's Report of Parental Behavior Inventory to 5th and 6th graders. Ss were 64 male and 83 female 5th graders and 54 male and 59 female 6th graders from a middle-class metropolitan suburb. Previous analyses had found 3 orthogonal dimensions: acceptance vs. rejection, psychological autonomy vs. psychological control, and firm vs. lax control. Results were similar for both grade levels. Correspondence analysis indicated high similarity be-

tween children of both sexes and sex of parent. Results replicate previous findings and extend the range of the inventory to a younger age group.—*S. Knapp.*

6592. Chandler, Frederick D. (U. Michigan) **A comparison of the effects of group discussion and of role playing with group discussion upon parental self-confidence.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3948.

6594. Ernhart, Claire B., Jordan, Thomas E., & Spaner, Steven D. (U. Missouri, St. Louis) **Maternal Quick Test (QT) scores in child development research.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 669-670.—Administered the Quick Test, a brief measure requiring recognition of vocabulary, to 503 mothers of mother-child pairs in a research program. Correlations with demographic variables, IQ of child, and an index of authoritarian attitude are presented to demonstrate its validity in such research.—*Journal abstract.*

6595. Forbes, Gordon B. & Dykstra, Dale. (Millikin U.) **Children's attribution of negative traits to authority figures as a function of family size and sex.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 363-366.—Measured attitudes toward authority in 105 male and 91 female 1st-4th grade students with a semiprojective test. It was found that boys had more negative attitudes toward authority than girls, and that boys from large families had more negative attitudes than males from small families. No relationship between attitudes toward authority and family size was found for girls. Findings suggest that the social learning experiences accompanying large family life produce more negative perceptions of authority.—*Journal abstract.*

6596. Heilbrun, Alfred B. (Emory U.) **Style of adaptation to perceived aversive maternal stimulation and selective attention to evaluative cues.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 340-344. Tested the hypothesis that given sustained exposure to aversive maternal control, the male child tends to adapt by 1 of 2 coping styles: (a) a closed style involving social avoidance and narrowed attention to evaluative cues, and (b) an open style embracing manipulative social approach and heightened attention to evaluative cues. 49 experimentally defined closed style and open style aversive-control male undergraduates were compared in their ability to recognize briefly exposed evaluative words. The closed style group correctly identified fewer words than the open style group as predicted. Incorrectly identified words reflected a tendency toward evaluative self-enhancement for both groups. Control comparisons revealed neither difference. Some promising relations between coping styles, breadth of attention to evaluative cues, and paranoid behavior are noted. (16 ref.)—*Journal abstract.*

6597. Henry, Jim G. (U. Kentucky) **Child-rearing practices in Mountain County, Kentucky.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3956.

6598. Hoffman, Martin L. (U. Michigan) **Father absence and conscience development.** *Developmental Psychology*, 1971(May), Vol. 4(3), 400-406.—Compared a father-absent and a father-present group, controlled for sex, IQ, and social class, on 7 moral attributes and overt aggression. Each group contained 25 male and 28 female 7th graders. Data were based on structured and semiprojective items and ratings by

parents, teachers, and peers. Father-absent boys (a) obtained lower scores for all the moral indexes—significantly lower for internal moral judgment, maximum guilt following transgressions, acceptance of blame, moral values, and rule conformity; and (b) were rated by teachers as significantly more aggressive than father-present boys. No differences between father absence and presence were obtained for girls. Evidence is presented that the effects of father absence on boys (a) are similar but somewhat more pronounced than the effects of nonidentification with a father who is present, (b) are partially attributable to the lack of a paternal model, and (c) may be partly mediated by the resulting changes in the mother's child-rearing practices. (23 ref.)—*Journal abstract*.

6599. Hurley, John R. & Hohn, Robert L. (Michigan State U.) Shifts in child-rearing attitudes linked with parenthood and occupation. *Developmental Psychology*, 1971(May), Vol. 4(3), 324-328.—Administered child-rearing attitude measures to 128 undergraduates. 6 yr. later, 75 Ss were contacted by mail and returned an abbreviated form of the same measures. General shifts toward increased manifest rejection and decreased overprotection occurred, but achievement pressure remained unchanged. Over this interval, producers of 3 or more children exceeded producers of less than 2 children in manifest rejection increments. Total child-rearing experience correlated positively with manifest rejection increments only among females. Males in person-oriented occupations increased less on manifest rejection but decreased more on overprotection than those in more impersonal occupations. These data and related findings suggest that high child production rates in the early postcollege years are accompanied by considerable maternal stress and a negative child-rearing stance. (16 ref.)—*Journal abstract*.

6602. Osofsky, Joy D. (Cornell U.) The shaping of mother's behavior by children. *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 400-405.—Attempted to investigate some of the child effects upon parents in an experiment with 65 white middle-class mothers, each of whom had at least 1 female child between the ages of 8 and 14. Utilizing a structured laboratory situation and an intervention approach, role playing children were trained to behave differently in each of 3 situations to determine possible effects upon the mothers. Differences in mothers' reinforcing behavior and teaching style were noted in response to the children's changing behaviors. Findings support the notion that children's behavior has an effect upon parental responses.—*Journal abstract*.

6603. Tuck, Samuel. (Inst. for Juvenile Research, Chicago, Ill.) Working with black fathers. *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 465-472.—Describes a strategy used to mobilize black fathers (4 initially) to provide new experiences for their preschool children within the ghetto. A much larger-scale neighborhood involvement evolved that included the fathers engaging their wives in a neighborhood social

event and sponsoring a local business venture. A concerted drive for community control resulted. It is suggested that if an indirect rather than a direct approach is used to engage black fathers, many of them can be mobilized to provide the emotional and positive experience necessary for the development of their children. 7 operating principles are suggested.—*Journal abstract*.

ADOLESCENCE

6604. Alarcon, Reynaldo. (U. San Marcos, Lima, Peru) *Objetivos vitales en adolescentes de distinto nivel socioeconómico*. [Life goals in adolescents of different socioeconomic levels.] *Revista Latinoamericana de Psicología*, 1969, Vol. 1(1), 55-61.—191 adolescents from higher and lower socioeconomic classes in Lima, Peru, were administered Buhler and Coleman's Life Goals Inventory to test the hypothesis that economic and social status of the Ss' families would influence their selection of life goals. No significant differences were found between the 2 classes; all Ss showed a predominant tendency toward internal control and creative expansion as the most desired goals.—*English abstract*.

6605. Ballante, Hazelene W. (Florida State U.) Empathic ability among lower- and middle-class adolescents in relation to several social-psychological variables. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4884.

6606. Baltes, Paul B. & Wender, Karl. (West Virginia U.) Age differences in pleasantness of visual patterns of different variability in late childhood and adolescence. *Child Development*, 1971(Mar), Vol. 42(1), 47-55.—Investigated pleasantness of 2 kinds of visual patterns (random shaped polygons and random dot configurations) of 14 different levels of variability in 240 9-, 11-, 13-, and 15-yr-old male and female Ss, using a cross-sectional approach. A monotonically increasing function between degree of variability and verbally stated pleasantness was found for all age groups. In addition, a relatively weak but significant Age \times Variability interaction resulted with the older Ss rating low-variability random shapes as less pleasant. Results are interpreted in the framework of research relating stimulus complexity to exploratory behavior. Earlier data, suggesting an age-invariant preference for an intermediate level of variability, are interpreted as representing a methodological artifact primarily due to biased sampling of the stimulus domain. (17 ref.)—*Journal abstract*.

6609. Coleman, John C. (London Hospital Medical Coll., England) *Independence in adolescence*. *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 7-10.—Contributed to the problem of the desire for independence among adolescents by utilizing projective rather than questionnaire material. In previous empirical studies of adolescence, less attention has been paid to the issue of independence. 20 13-17 yr. olds, referred to a psychologist by a child guidance center, were given the TAT. Stories were read by Ss and

then analyzed according to the primary source of conflict between parent and child, and according to the solution of the conflict. 12 Ss gave at least 1 story which showed evidence of a conflict over independence. There was a total of 22 stories. 6 areas of conflict were distinguished: love, leaving home, attitudes, career, freedom of behavior, and accepting advice. 4 solutions were designated. The projective method has elicited material which was difficult to obtain by means of a questionnaire; it shows that among a group of adolescents, independence is their primary problem.—*A. Farfaglia.*

6610. Cunha, Jurema A., Carvalho, Lília C., Braga de Moraes, Maria I., & Maraninchi, Suely. **Nível intelectual dos estudantes de escolas médias de Porto Alegre.** [Intellectual level of postelementary school students of Porto Alegre.] *Arquivos Brasileiros de Psicotécnica*, 1968(Sep), Vol. 20(3), 39-44.—Reports results from 720 12-18 yr. old postelementary school-children tested on the nonverbal intelligence test of Gilles-Weil. It was found that (a) the Porto Alegre Ss scored significantly higher than existing percentile scores for adolescents in general; and (b) the Ss' school seemed to influence the indications of intellectual development, particularly in the area of abstract thought and logic.—*P. Hertzberg.*

6611. Dreyer, Albert S., Hulac, Valerie, & Rigler, David. (U. Connecticut) **Differential adjustment to pubescence and cognitive style patterns.** *Developmental Psychology*, 1971(May), Vol. 4(3), 456-462.—Presents a longitudinal study of the adaptation of 12 boys and 10 girls to pubescent body changes. An analysis of variance of Sophistication of Body Concept Scale (SBCS) scores using (a) field independent-field dependent cognitive styles, (b) pre- and postonset of puberty, and (c) sex as main effects indicates that significantly more sophisticated SBCS scores were associated with field independent Ss and postpubescent status. There were no sex differences and none of the interactions were significant. Age and IQ were also not related to SBCS score change. Findings support the hypothesis of a more highly differentiated response to puberty by the more field independent adolescents. (17 ref.)—*Journal abstract.*

6612. Feshbach, Norma & Sones, Gittelle. (U. California, Los Angeles) **Sex differences in adolescent reactions toward newcomers.** *Developmental Psychology*, 1971(May), Vol. 4(3), 381-386.—Examined sex differences in indirect aggressive behaviors. Reactions of 14 male and 15 female 8th grade pairs to a same-sex newcomer were observed. Following a problem-solving session, the group members rated each other's personality. Female Ss made less favorable judgments of the newcomer than did males. On behavior-interaction measures obtained during the problem-solving task, female Ss displayed less friendly reactions than males toward the newcomer. Results, in conjunction with those of an earlier study, reflect developmental consistencies in sex differences in the use of indirect aggressive behaviors. (15 ref.)—*Journal abstract.*

6613. Jackson, E. B. **The girl in puberty: A psycho-pedagogical study.** *Opvoedkundige Studies*, No. 59, 77 p.—Considers the girl in puberty as a unique individual in a unique situation and discusses (a) her physical development; (b) her affective and mental development; and (c) her environment, comprising family, friends, and society. Results are based on the examination of 16 girls in puberty with (a) interviews

with parents; (b) pedagogical observation; (c) a test of emotional lability; (d) the Rorschach Inkblot Test; (e) TAT; (f) drawings of people and trees; (g) the Four Picture Test; (h) essays on the future, mother's idealized role, and actions if life could be lived over; (i) a drawing completion test; (j) the Rotter Incomplete Sentences Blank; and (k) the New South African Individual Scale intelligence test. Data from these tests are presented for 3 15-yr-old girls. The phenomenological approach used in this study is discussed. (40 ref.)—*S. Knapp.*

6614. Jans, J. (Catholic U., Psychological Lab., Nijmegen, Netherlands) **Psychometrisch onderzoek naar ego-identiteit volgens Erikson.** [Psychometric investigation about ego-identity according to Erikson.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Jan), Vol. 26(1), 1-22.—Erikson considered the problem of adolescence as the resolution of ego identity vs. ego diffusion. Ego identity is described as "the accrued confidence that one's ability to maintain inner sameness and continuity... is matched by the sameness and continuity of one's meaning for others." A. Constantinople's (see PA, Vol. 43:14144) revision of A. E. Wessman and D. F. Rick's (see PA, Vol. 40:7692) test of 60 items based on self-reports by students indicating their success in their development, according to Erikson's 8-step model, was administered to 90 Ss. By means of iterative cluster analysis, ego identity vs. ego diffusion along with 5 other traits did not attain required internal consistency. With respect to explorative cluster analysis, 3 clusters were identified: (a) inhibition in self-development, (b) fear in one's work, and (c) lack of interest in others. The items in inhibition in self-development could be the basis for further research in ego-identity crisis.—*A. J. Ter Keurst.*

6615. Landsbaum, Jane B. & Willis, Richard H. (Malcolm Bliss Mental Health Center, St. Louis, Mo.) **Conformity in early and late adolescence.** *Developmental Psychology*, 1971(May), Vol. 4(3), 334-337.—Examined (a) the view that conformity behavior characterizes early adolescence and diminishes in later adolescent years, and (b) whether previous research on partner influence would hold with adolescents. 32 13-14 and 18-21 yr. old males and females served as Ss. Ss perceptions of their own and their partner's competency were manipulated by means of a sham pretest of judgmental skill. Results indicate that younger adolescents, "low-competency" Ss, and Ss with "high-competency" partners showed the most conformity behavior.—*Journal abstract.*

6616. Love, David N. (Florida State U.) **Parent-adolescent communication as related to family social variables.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5629-5630.

6617. Musgrave, Letha C. **Hot line takes the heat off.** *American Journal of Nursing*, 1971(Apr), Vol. 71(4), 756-759.—Describes the hot line program which offers telephone assistance to adolescents overwhelmed by their problems. By dialing Hot Line, a caller may have a competent adult trained in creative listening techniques help him examine his situation and decide on a solution that would be realistic for him. A caller may receive information about free clinics, drug counseling, or draft counseling; he may get the address of a crash pad. In many communities, hot lines have been valuable in crisis intervention.—*Journal abstract.*

6618. Muthayya, B. C. (National Inst. of Community Development, Hyderabad, India) **A study of the**

relationship between level of aspiration and reactions to frustration. *Psychology Annual*, 1969(Mar), Vol. 3, 3-9.—Determined level of aspiration in 59 male and 29 female 13-17 yr. olds using Ss' predictions of their scores on 6 tasks. Ss completed the Madras Picture Frustration Test (MPF) 6 mo. later. The MPF was scored for reaction categories: extrapunitive (E), intro-punitive (I), impunitive (M), direction (O), obstacle dominance (OD), ego defensive (ED), and need persistence (NP). Significant correlations between mean goal discrepancy scores and frustration reactions were found only for M and OD where the relationship was negative. Correlations between high positive and negative aspiration patterns and E and M were more significant than for aspiration patterns and E and I reactions. High positive aspirations were significantly related to E and negative aspirations to M. (22 ref.)—S. Knapp.

6619. Nagy, György. (National Inst. of Education, Budapest, Hungary) *Férfi ifjúsági kosárlabdázók pszichológiai vizsgálata különös tekintettel a személyiségvonások, teljesítmény és motiváció kapcsolataira*. [Psychological examination of male basketball players: An attempt at correlating personality traits, achievement and motivation.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(3), 370-382.—Employed the Rorschach Szondi tests, the Bregelmann questionnaire, case history taking, sport achievement evaluation, analysis of written tasks, and measurements of latency time in task oriented movements in the examination of 20 male adolescent basketball players. Findings were that (a) adolescents engaged in sports have stenic (rigid) character; (b) there is no correlation between IQ and rank order in sport achievement; and (c) their aspiration is concentrated on winning the title of "member of the representative team." The latter provides a high motivational level and stimulates time spent on training. (Russian summary)—English summary.

6620. Nawas, M. Mike. (Indiana State U.) *Change in efficiency of ego functioning and complexity from adolescence to young adulthood*. *Developmental Psychology*, 1971(May), Vol. 4(3), 412-415.—Analyzed the TAT stories of 64 male and 61 female Ss who were studied as adolescents in 1952 and as young adults 8 yr. later. Ego sufficiency and perceptual complexity scores, based on the TAT, were derived for each of the Ss. Confirming the predictions, the changes from adolescence to young adulthood revealed a significant increase for males and a highly significant decrease for females in both ego sufficiency and complexity. It is concluded that the evidence from long-range longitudinal studies is mounting, that the assumption of continuity in human development is too simplistic, and that behavior is subject to greater changes than current theories lead one to believe.—Journal abstract.

6621. Nowicki, Stephen & Roundtree, Julia. (Emory U.) *Correlates of locus of control in a secondary school population*. *Developmental Psychology*, 1971(May), Vol. 4(3), 477-478.

6622. Pegg, Joanne L. (George Peabody Coll. for Teachers) *The personality integration of early adolescents*. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5003-5004.

6623. Raubo, Jadwiga. *Postawa młodzieży wobec zjawiska śmierci*. [The attitude of youth to death.] *Przegląd Psychologiczny*, 1971, Vol. 1(2), 105-128.—Examined attitudes toward death in 133 11th graders, using

a film, a questionnaire, an interview, Raven's Progressive Matrices, and the Eysenck Personality Inventory as measures. Sex, family position, and relationship with parents and peers were significantly related to attitudes. Reflections on death tended to arise under the impact of death of relatives, illness, and consideration of the meaning of life. In approximately 1/3 of the Ss difficult situations produced thoughts of or attempts at suicide. Most Ss regarded death as a biological and natural phenomenon. Negative attitudes were found toward euthanasia, suicide, the death penalty, and ending the lives of the aged. Emotional attitudes ranged from fear, horror, clinging to life, and repulsion, to joy. Males tended to approach the concept of death cognitively, females emotionally. Extroversion or introversion, level of intelligence, and other factors studied did not differentiate between attitudes held. (Russian summary) (46 ref.)—English summary.

6624. Robinson, John P. & Hirsch, Paul. (U. Michigan) *It's the sound that does it*. *Psychology Today*, 1969(Oct), Vol. 3(5), 42-45.—A survey of 430 Detroit and 340 Grand Rapids, Michigan, 8th and 11th graders revealed that a minority understood the lyrics of current best-selling records even though most liked the current "hits." Their expressed concern was whether they liked the sound of the records, not the lyrics. Antiestablishment themes in popular music have become part of the established music industry but it is questionable how much the listeners are influenced by them. E. J. Posavac.

6625. Schneemann, N. (8 Volkhartstr., Augsburg, W. Germany) *Gedanken zur Entstehungsgeschichte des Gammers anhand einer Analyse des Struwwelpeters*. [Reflections concerning the formative story of a hippie based on an analysis of Struwwelpeter.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Nov), Vol. 20(6), 213-223. Analyzed a character (prototype of a hippie) in a children's book in an attempt to isolate social causative factors. Lack of family atmosphere and familial interpersonal relationships is seen to be one of the main causative factors. Hostility, which is a result of lack of adequate parental figures becomes displaced, and is manifested in the form of antisocial behavior. (English summary) (30 ref.)—B. A. Stanton.

6626. Shea, Barbara J. (U. Iowa) *Help-seeking behavior as a function of peer-rated aggression, age of subjects, and conditions of help*. *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5641-5642.

6627. Shirley, Fehl L. (Ferris State Coll.) *The influence of reading concepts, attitudes, and behavior*. *Journal of the Reading Specialist*, 1968(Dec), Vol. 8(2), 50-57. Studied the influence of reading in personal development on 420 high school students. A questionnaire was the major instrument used. A qualitative analysis of the reported influences on concept, attitude, and behavior was made. Ss commented on classical readings, e.g., *The Lord of the Flies*. Responses were classified into areas influenced by reading, and 7 areas in order of frequency emerged from the analysis of the data: (a) self image, (b) philosophy, (c) cultural groups, (d) social problems, (e) sensitivity to people, (f) political science, and (g) miscellaneous. The reports of the adolescents showed that reading does influence concepts, attitudes, and behavior. Only 16 of the 420 students reported no personal influence from reading. Of the 1184 influences reported, 45% were concepts, 40%

were attitudes, and 15% were behavioral responses. Ss' concepts, attitudes, and behavior appear to be more influenced by reading materials they selected on their own. The number of influences is related to intelligence, reading proficiency, and situation rather than type (fiction or nonfiction).—A. M. Farfaglia.

6628. Turner, Jonathan H. (U. California, Riverside) **Entrepreneurial environments and the emergence of achievement motivation in adolescent males.** *Sociometry*, 1970(Jun), Vol. 33(2), 147-165.—Discusses previous research which has (a) traced high need for achievement (n Ach) among adolescent males to certain socialization experiences within the family, and (b) demonstrated that adolescents with high n Ach are over-represented in the middle classes. Among the many variables associated with social class, the nature of the father's occupation is considered most likely to have this effect on family socialization. The relationship between father's occupation and the level of achievement motivation in their sons was examined using the entire 7th and 8th grade male population of 3 different types of communities. Ss completed an extensive questionnaire on their father's occupations and the TAT. Results indicate that high n Ach Ss came from homes where fathers engage in entrepreneurial role behavior in their occupational status. This was true regardless of whether or not such an occupation was middle or working class, or whether the community where the S lived was highly modern or traditional. Findings are discussed as specifying more exactly the social structural origins of achievement motivation. (28 ref.)—*Journal abstract*.

6629. Weigert, Andrew J. & Thomas, Darwin L. (U. Notre Dame) **Socialization and religiosity: A cross-national analysis of Catholic adolescents.** *Sociometry*, 1970(Sep), Vol. 33(3), 305-326.—Relates dimensions of religiosity (belief, experience, knowledge, and practice) to adolescents' perception of the control and support received from parents. A total of 740 Ss were chosen from 4 urban male Catholic schools in the United States, Puerto Rico, and Mexico. Except for the Mexican sample and the knowledge dimension, the apriori hypothesis that adolescents perceiving a high (low) degree of control and support score highest (lowest) on religiosity is moderately verified, mainly because of a positive relationship between support and religiosity, although control is noticeably related in the Puerto Rican sample. For the Anglo samples, the usefulness of socialization variables in understanding religiosity is demonstrated, and the differences across samples point to the importance of reasons for religious behavior. (4 p. ref.)—*Journal abstract*.

ADULTHOOD & OLD AGE

6630. Clark, Margaret. (U. California, San Francisco) **Patterns of aging among the elderly poor of the inner city.** *Gerontologist*, 1971(Spr), Vol. 11(1, Pt. 2), 58-66.—The last 2 decades have witnessed a decline in the quality of life in American inner cities. "Unlike some in the ethno-minority groups . . . the white, impoverished inner-city aged lack the familial supports and the respect of others which sustain the waning powers of those in certain minority groups. Although they are not as isolated from their kind as was once supposed . . . their life-style seems to exemplify isolation, social invisibility, and—above all—grinding poverty." The functional and dysfunctional aspects of inner-city life are discussed in

regard to nutrition, shelter, mobility, and social interaction. It is concluded that "the urban environment, like any other milieu in which aged individuals find themselves, has great potential for promoting both human misery and human survival." Stressed is the need to examine how the aged poor, "when faced with basic problems of physical and psychological survival, develop informal structures for their solution. If planned programs can be constructed to emulate or develop these spontaneous arrangements among people, they are more likely to be acceptable and effective." (48 ref.)—L. Linnick.

6631. Cox, Troy J. (Louisiana State U., Agricultural & Mechanical Coll.) **Relations among selected auditory parameters and age.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4790-4791.

6632. Gubrium, Jaber F. (Marquette U.) **Environmental effects on morale in old age and the resources of health and solvency.** *Gerontologist*, 1970(Win), Vol. 10(4, Pt. 1), 294-297.—Analyzed the effects of age concentration of local environments on morale among the aged, controlling for health and solvency. Since health and solvency are considered as resources influencing the behavior flexibility of persons, it was hypothesized that ego concentration would be positively related to morale only when resources were poor. Data from interviews with 210 people, 60 yr. of age and over, supported the hypothesis. Environmental variations have the greatest impact on the morale of old people with the least flexible behavior.—*Journal abstract*.

6633. Hultsch, David F. (Pennsylvania State U., Div. of Individual & Family Studies) **Adult age differences in free classification and free recall.** *Developmental Psychology*, 1971(May), Vol. 4(3), 338-342.—Presented a verbal free classification and free recall task to 20 20-29, 40-49, and 60-69 yr. old white females. $\frac{1}{2}$ the Ss categorized words into 2-7 categories prior to free recall, while the other Ss inspected the words but were prevented from physically sorting them. There were no significant age differences in free classification performance under the sorting condition. Analysis of free recall data indicate a significant Age \times Experimental Condition interaction. Under the sorting condition, the 2 groups of younger Ss recalled significantly more words than the older Ss. Under the nonsorting condition the 20-29 yr. old Ss recalled significantly more words than the older Ss. Findings support the hypothesis of a greater age-related decrement in memory performance under conditions that minimize the opportunity for meaningful organization than under conditions that maximize such opportunity.—*Journal abstract*.

6634. Marcoen, Alfons. (Catholic U., Louvain, Belgium) **Het rollenpatroon van bejaarden in een tehuis.** [Role patterns of the institutionalized aged.] *Psychologica Belgica*, 1970, Vol. 10(2), 201-224. 40 74-81 yr. old institutionalized persons, an equal number of widows, widowers, and unmarried men and women, living 2-10 yr. in a home, were interviewed with the aid of an adapted schedule from the "Cross-national study: Adjustment to retirement." Results show that family roles still played an important part and total isolation was not reported. Compensation phenomena, such as friendships, church membership, leisure time, were especially noticeable among women and at higher ages. The aged reported a general decrease in activity as a function of age and accepted it as natural. (English abstract) (28 ref.)—S. Slak.

6635. Powell, Richard R. & Pohndorf, Richard H. (U. Illinois) **Comparison of adult exercisers and nonexercisers on fluid intelligence and selected physiological variables.** *Research Quarterly*, 1971(Mar), Vol. 42(1), 70-77.—Administered a test of specific mental abilities reflective of cognitive deterioration associated with aging to 71 34-75 yr. old male Ss. Mental test results of 26 older men who had been participating in a regular exercise program of the running type for more than 3 yr. were compared to the mental test results of 22 men who had engaged in little or no physical activity for at least 3 yr. prior to their testing. Mental ability was measured by the "Culture Fair" Intelligence Test. It was also determined whether or not any of 8 cardiovascular fitness measures were related to mental ability performances among the exercisers and nonexercisers ($N = 48$) as well as an additional 23 men whose exercise status was uncertain. It was found that regular exercisers scored higher as a group on the mental decrement test than did the nonexercise group. In general, better fitness measures were found to accompany higher fluid intelligence scores. In particular, measures related to elevated blood pressure were usually associated with poorer fluid intelligence measures. (18 ref.)—*Journal abstract*.

6636. Rossiter, Charles M. (U. Wisconsin, Speech Communication Center, Milwaukee) **Chronological age and listening of adult students.** *Adult Education*, 1970(Fal), Vol. 21(1), 40-43.—Tested recall of information in a tape recorded passage by 30 female 20-60 yr. old undergraduate and graduate students. The correlation between age and listening test scores was $-.46$ which is significant at the .01 level. Regression analysis yielded a significant F ($p < .01$) for linearity of regression. It is concluded that teachers of adult students varying widely in age should be aware that the older students may be retaining less from oral presentations of information than younger students.—*Journal abstract*.

6637. Tallmer, Margot & Kutner, Bernard. (Hunter Coll., City U. New York) **Disengagement and morale.** *Gerontologist*, 1970(Win), Vol. 10(4, Pt. 1), 317-320.—In an empirical study of the "disengagement theory" of aging, the morale factor was found to be unrelated to marital status, sex, health status, income, cause of unemployment, aging, and engagement. The study replicated the methods used by Cumming and Henry in their Kansas City Study of Aging, including their "morale indexes." Morale appears to be related to life style and circumstances often beyond control: health, income, widowhood, and retirement. It is suggested that the process of social withdrawal be studied since only voluntary disengagement may yield high morale, while enforced, stressful disengagement may be associated with hopelessness and despair. (20 ref.)—*Journal abstract*.

CULTURE & SOCIAL PROCESSES

6644. Abély, Paul. (St. Anne Hosp., Paris, France) **Les avatars du sentiment de liberté.** [The incarnations of the feeling of freedom.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 191-199. Liberty occupies a precarious position between dictatorship and anarchy. Alternating philosophic emphasis on the forces of determinism and free-choice in human affairs often neglect the need for both influences in the successful operation of any society. The preoccupation of today's youth with freedom from nearly all forms of restraint is discussed. The contemporary frenzy to be rid of all parental, university, and sexual restriction is seen to have its roots in the many homes without fathers (prisoners of war, soldiers, or displaced persons) immediately after World War II. This gave rise to more than the normal desire of each generation to overthrow its predecessors. This generation may also have been the victim of an overacceptance of the psychoanalytic doctrine that restraint is harmful to the individual, to the neglect of a need for the continuing of certain restraints in the interest of society.—*H. King*.

6649. Milgram, Stanley. (City U. New York, Graduate Center) **The experience of living in cities.** *Science*, 1970(Mar), Vol. 167(3924), 1461-1468.—*Dis-*

cusses the contribution that psychology can make to the understanding of living experiences in cities, the construction of urban theories, and the creation of lines of research. Root elements of a sociopsychological understanding of city life include large numbers, density, and heterogeneity of population. The individual experiences these factors as overloads at the level of roles, norms, cognitive functions, and facilities. The overloads in turn lead to adaptive mechanisms which create the distinctive tone and behaviors of city life. The differing atmospheres of cities, e.g., Paris, London, and New York are examined. It is suggested that more precise knowledge of urban atmosphere can be attained by applying tools of experimental inquiry. (23 ref.)—*P. McMillan*.

6651. Porteus, S. D. (U. Hawaii) **Possible effects of rate of global spin.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 503-509.—Technological retardation among certain ethnic groups has been commonly ascribed to the mental inertia associated with prolonged residence in tropical climates. However, in every direction except human resourcefulness tropical conditions favor the most rapid development. There were exceptional civilizations in tropical regions, but their decline was hastened by the failure of peoples in the New World to invent and use the wheel and the onset of the debilitating diseases of malaria, hookworm, etc. Another factor may be that the equatorial bulge happens also to be the region of greatest velocity of diurnal rotation. A device that could possibly assist in gathering data on the effect of extremes of spin is described. Its use might also reverse the trend toward overdomestication of the albino rat. Present-day progress in space travel could favor such study.—*Journal abstract*.

Ethnology

6653. Del Campo, Philip E. (United States International U., San Diego, Calif.) **An analysis of selected factors in the acculturation process of the Mexican-American elementary school child.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4885-4886.

6654. Kalish, Richard A. (U. California, School of Public Health, Los Angeles) **A gerontological look at ethnicity, human capacities, and individual adjustment.** *Gerontologist*, 1971(Spr), Vol. 11(1, Pt. 2), 78-87.—Discusses "the difficulties of doing good research on ethnicity." It is suggested that the concern of the psychologist should relate to "research into ethnic differences in performance on simple sensory, motor, and cognitive tasks.... the evaluation of differences among the elderly of ethnic groups regarding personality, adjustment, values, roles" requires the attention of all behavioral scientists. Also relevant for all behavioral scientists is "the meaning of age-related changes to the various ethnic groups.... How does the loss of certain capabilities effect the elderly person's standing in his ethnic group?" To the anthropologist is relegated the problem of defining good adjustment as perceived in each ethnic group. How the 50s, 60s, and 70s differ and how they differ from the 65-plus current population are

areas of concern of the social gerontologists. Being aware "that the individual personality functions in an environment that is affected by economic conditions, climate, international relations, pollution, health services," the investigator must remain attuned to individual differences, ethnic group differences and differences within ethnic groups.—*J. Linnick*.

6655. Lloyd, Barbara B. (U. Sussex, Brighton, England) **The intellectual development of Yoruba children: A re-examination.** *Journal of Cross-Cultural Psychology*, 1971(Mar), Vol. 2(1), 29-38.—It was suggested that traditional and educated Yoruba children converged in intelligence by age 5 but the current study found no evidence of convergence. An intervention program was proposed to compensate for the intellectual advantage of educated Ss.—*A. Krichev*.

6656. Rubin, Roger H. (Pennsylvania State U.) **Family structure and peer group affiliation as related to attitudes about male-female relations among black youth.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4920-4921.

6657. Schwartz, Theodore. (U. California, San Diego) **The noise: Cargo-cult frenzy in the South Seas.** *Psychology Today*, 1971(Mar), Vol. 4(10), 51-54, 102-103.—The cults of the Admiralty Islands expect miraculous loads of cargo to be brought to them which will give them parity with the Europeans. The appearance of these cults seems to be a "manifestation of a paranoid ethos under conditions of culture contact and value dominance." The culture of the Melanesians is marked by distrust and hostility and its value system has been overwhelmed by European wealth. Parallels are drawn between the cargo cults, American subgroup hostility, and the dropout counterculture.—*E. J. Posavac*.

6658. Wittmer, Joe. (U. Florida) **Perceived parent-child relationships: A comparison between Amish and non-Amish young adults.** *Journal of Cross-Cultural Psychology*, 1971(Mar), Vol. 2(1), 87-94.—The Parent-Child Relations Questionnaire was administered to 25 Amish and 25 non-Amish late teen-agers. Amish parents were seen as "less rejecting, less neglecting, less casual, less likely to reward directly, and less likely to use symbolic methods of punishment." Amish fathers were seen as more loving than non-Amish fathers. Results are discussed in light of the Amish culture.—*A. Krichev*.

Social Structure & Social Role

6659. Atherton, Charles R., Mitchell, Sandra T., & Schein, Edna B. (U. Illinois, Jane Addams Graduate School of Social Work) **Locating points for intervention.** *Social Casework*, 1971(Mar), Vol. 52(3), 131-141.—Presents a system for classifying social problems into areas related to (a) role performance, (b) problematic roles, and (c) defects in social systems that affect behavior. The purpose was to identify points for intervention.—*M. W. Linn*.

6660. Rappaport, Alan F., Payne, David, & Steinmann, Anne. (Pennsylvania State U.) **Perceptual differences between married and single college women for the concepts of self, ideal woman, and man's ideal woman.** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 441-442.—Compared perceptions of the female sex role held by 45 married and 45 single college women. Ss were compared in their perception of self, ideal woman, and man's ideal woman with the Inventory of Female Values. Results indicate that the single group

was significantly more family oriented than the married group in perceiving self and ideal woman. No significant differences were found between the groups in perceiving man's ideal woman. Both married and single Ss indicated their belief that most men would desire an ideal woman with a strong intrafamilial orientation. Results are explained in terms of cultural stereotypes enveloping the female sex role in our society.—*Journal abstract.*

6661. Rushing, William A. (Vanderbilt U.) **Class, power, and alienation: Rural differences.** *Sociometry*, 1970(Jun), Vol. 33(2), 166-177. —Investigated the validity of the postulation of an inverse relationship between social class and powerlessness. 240 middle- to upper-class farmers and 1,031 poverty-level farm workers were studied for correlations between social class and feelings of powerlessness. Results indicate that powerlessness was associated with income and perceived socioeconomic deprivation as expected, but not position in the system of production. Although farmers had much greater political-economic power than workers, they did not view themselves as having greater power. Results fail to support the hypothesis that power of position is associated with the perception of power among incumbents. It is suggested that bureaucratic and reference-group processes influence such perceptions. (27 ref.)—*Journal abstract.*

6662. Segal, David R., Segal, Mady W., & Knoke, David. (U. Michigan) **Status inconsistency and self-evaluation.** *Sociometry*, 1970(Sep), Vol. 33(3), 347-357. —Discusses the social psychological exchange model upon which much of the recent status inconsistency literature is based which assumes that individuals will attempt to maximize their social positions by stressing those status dimensions that give them claim to the greatest amount of deference from others. Analysis of data from a national sample of 1,571 American adults, however, suggests that status inconsistent people average their several statuses in defining their social positions, rather than maximizing their claims by disregarding low statuses. Results show that highest status, average status, and occupation are of primary importance in explaining social class identification among status consistent respondents and do not differ significantly from each other. Income and education have significantly weaker relationships to class identification ($p < .001$).—*Journal abstract.*

6663. Weisstein, Naomi. (Loyola U., Chicago, Ill.) **Stimulus/response: Woman as Nigger.** *Psychology Today*, 1969(Oct), Vol. 3(5), 20-22, 58. —Argues that a psychology that ignores the social situation in which behavior takes place, continues the error of Freud and others who believed that behavior is primarily caused by something inside the person. This error has resulted in the practice of believing that women are psychologically different from men. Women do what the social environment causes them to do. One cannot discuss differences between the sexes until males and females are raised in a society which expects both to succeed. Until then theories about sex differences in behavior are only a reflection of prejudice.—*E. J. Posavac.*

Religion

6664. Beck, Samuel J. (U. Chicago) **Cosmic optimism in some Genesis myths.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 380-389. —Considers myths as statements in metaphor about rigorous

life problems, which project emotional realities. Among Genesis myths are etiologic rationalizations for: (a) harsh toil for sustenance, (b) woman's pain in childbirth, (c) the unequal struggle against conscience, (d) punishment for murder, and (e) world destruction and rebirth. The dominant tone is optimism.—*Journal abstract.*

6665. Hinkle, John E. (Northwestern U.) **A study of attitudes toward anger and the expression or inhibition of anger in a religious and non-religious population.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4256.

6666. Stinnette, Charles R. (U. Chicago, Divinity School) **Existence and faith: A theological method as focused in psychosocial perspectives.** *Journal of Pastoral Care*, 1970(Sep), Vol. 24(3), 165-177. —Discusses the methods of theology in terms of sources of data, as a theater of examined experience, and as a cognitive model.—*O. Strunk.*

6667. Strunk, Orlo. (Boston U., School of Theology) **Humanistic religious psychology: A new chapter in the psychology of religion.** *Journal of Pastoral Care*, 1970(Jun), Vol. 24(2), 90-97. —Although the psychology of religion is nearly 100 yr. old, its survival as an academic discipline frequently has been in jeopardy. The present humanistic psychology movement may provide the psychology of religion with needed vigor by emphasizing the depth dimensions of religion, by greater stress on interdisciplinary involvement, and by providing the field with a new perspective.—*O. Strunk.*

6668. Struzzo, John A. (Florida State U.) **Professionalisms and non-conformity among Catholic clergy in the exercise of their ministerial role.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4890.

Cross Cultural Comparison

6669. Bhalla, Salma. (U. Massachusetts) **Interpersonal schemas: A cross-cultural comparison.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4981-4982.

6670. Okonji, Ogbolu M. (Makerere University Coll., Kampala, Uganda) **A cross-cultural study of the effects of familiarity on classificatory behaviour.** *Journal of Cross-Cultural Psychology*, 1971(Mar), Vol. 2(1), 39-49. —138 Ibusa and 105 Glasgow male elementary schoolchildren were given 2 classificatory tasks, 1 of animals familiar to both and 1 of objects more familiar to the Ibusa children. Degree of familiarity was found to influence the classifications, but the overall trend of development was similar in both samples in both tasks.—*A. Krichev.*

6671. Ross, Bruce M. & Millsom, Carol. (Catholic U. of America) **Repeated memory of oral prose in Ghana and New York.** *International Journal of Psychology*, 1970, Vol. 5(3), 173-181. —Ss enrolled in 3 collegiate education classes in Ghana and in 3 child development classes in an American university listened to a short prose passage. Immediately afterwards, and at 2 intervals involving several weeks, Ss reported what they remembered. The hypothesis, that Ghanaian Ss would perform significantly better than their American counterparts, owing to a strong oral tradition in Africa, received support in all but 1 instance. In contrast to memory investigations commonly undertaken, this study, with its emphasis upon retention of content through verbal paraphrase,

highlights inadequacy of explaining the forgetting of connected prose by making use of the measure of decrement in literal memory alone. (French abstract) —S. E. Gavin.

6672. Saville, Margaret R. (U. Hawaii) **Individual and group risk taking: A cross-cultural study.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4268.

Family

6673. Cone, John D. (West Virginia U.) **Social desirability, marital satisfaction, and concomitant perceptions of self and spouse.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 173-174.—Reanalyzed data from a study by E. B. Luckey (see PA, Vol. 30:5527) in terms of social desirability (SD). Correlations between endorsement of adjectives of the Interpersonal Check List and marital adjustment varied linearly with the SD scale values of the adjectives. The respective correlations between SD scale values and adjective-adjustment correlations were .75 and .89 for self- and spouse-rating conditions (N = 80 couples). It is concluded that SD may be an important moderator influencing correlations of personality scales and marital adjustment.—*Journal abstract*.

6674. Fromm, Erich. **Mother.** *Psychology Today*, 1971(Mar), Vol. 4(10), 74-77.—Several social psychological changes in contemporary society indicate that the values of mother-like nurturance are displacing the more strict, abstract values of patriarchal authority. However, the "purely matriarchal society stands in the way of the full development of the individual, thus preventing technical, rational, artistic progress." The ideal society synthesizes the often opposing principles of mercy and justice.—E. J. Posavac.

6675. Gustav, Alice. (Monmouth Coll.) **Ritual in families of dissident and non-dissident students.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 563-567.—158 college students, many of whom had engaged in serious dissident behavior, and 277 who had not, wrote brief descriptions of a ritual in their family life. Approximately 95% of both groups considered the family an important element in their development. A significantly larger percentage of nondissident Ss reported the following experiences taking place within a family context: meals, positive communication with parents, and celebration of holidays with both immediate and extended families. A significantly larger percentage of more dissident Ss reported adverse communication with parents and TV watching.—*Journal abstract*.

6676. Holz, Robert F. (American U.) **Similarity and complementarity in marital interaction: The effects of role on need patterns.** *CRC Report, Boston U.*, 1970(Oct), No. 46, 17 p.—Studied the effects of role expectations of spouses on patterning of needs. Ss were 49 recently married (14 mo.) childless couples, matched for age, education, religion, parental occupation, and social class. In terms of expressive need, egalitarian dyads reflected similarity while traditional dyads reflected complementarity. Conversely, in terms of instrumental need, egalitarian dyads were found to reflect complementarity while traditional were characterized by similarity.—*Journal abstract*.

6677. Marcer de Stancato, Beatriz, et al. (Salaberry Hosp., Buenos Aires, Argentina) **Familia y marginalidad en el Gran Buenos Aires: Una aprox-**

imacion psicológica. [Marginality and family structure in Buenos Aires: A psychological approximation.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 63-80.—The "marginal" character of the population in the slums of Buenos Aires, primarily derived from an urban-directed migration of agrarian workers, combined with the stresses of poverty and unemployment has resulted in an extreme disruption of the usual patriarchal family. Courtship patterns, sexual relationships, and parent-child relationships are all altered in a fashion such that the individual is unable to function effectively. Various psychopathological behaviors are so prevalent as to be considered normal. The moral issue concerning the propriety of working for an agency whose housing and relocation plans contribute to the problem is also discussed.—S. M. Halpin.

6678. Murstein, Bernard I. (Connecticut Coll.) **Stimulus-value-role: A theory of marital choice.** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 465-481.—Presents a 3-stage theory of marital choice called stimulus-value-role. The majority of data stem from studies involving 197 couples who were engaged or "going steady," and who were given a revised form of the EPPS and the Marital Expectation Test. The 1st (stimulus) stage consists of value satisfaction obtained by visual, auditory, and noninteractional means. The 2nd (value) stage consists of values appreciated through verbal interaction, and the 3rd (role) stage involves the ability of the couple to function in mutually assigned roles. Among the topics considered are whether similars or opposites marry, sex-drive, self-acceptance, neuroticism, physical attraction, greater importance of men in determining courtship progress, and imagined role-compatibility as opposed to actual role-compatibility. A series of 19 hypotheses and supporting data are presented. (45 ref.)—*Journal abstract*.

6679. Petranek, Charles F. (Florida State U.) **Post-parental spouses' perception of their dyadic interaction as related to their life satisfaction.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4920.

6680. Ryder, Robert G., Kafka, John S., & Olson, David H. (National Inst. of Mental Health, Section on Family Development, Bethesda, Md.) **Separating and joining influences in courtship and early marriage.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 450-464.—Describes transitional processes, e.g., getting married, in terms of the interaction of change-facilitating and change-resisting social forces. Information was gathered from a sample of about 2000 couples and a more intensively studied sample of 50 couples. Information was gathered by means of autobiographical essays and unstructured interviews. Lawful features of a transitional process include a nonarbitrary sequence of stages defined by reversals in the influence of particular classes of 3rd party events. (23 ref.)—*Journal abstract*.

6681. Stierlin, Helm. (National Inst. of Mental Health, Bethesda, Md.) **Die Familienbeziehung.** [Family relationships.] *Psyche, Stuttgart*, 1970(Sep), Vol. 24(9), 678-691.—Freud was interested chiefly in analytic dyadic relations and in the inner psychic processes of his patients; family relations were implied theoretically and therapeutically, but were not made the main focus. The interdependence which exists between parents and their offspring and the dialectic interdependence of the family and its surrounding society are discussed. In order for the offspring to develop an ego-autonomy, all family

members must share in a complex work of delimitation and reconciliation. The dialectic of closeness and distance whose success or failure shapes the style of interaction and communication prevailing in a given family is crucial.—*English summary.*

Social Change & Social Programs

SEXUAL BEHAVIOR

6683. Birenbaum, Arnold. (Wheaton Coll., Norton, Mass.) **Revolution without the revolution: Sex in contemporary America.** *Journal of Sex Research*, 1970(Nov), Vol. 6(4), 257-267.—Discusses the sexual revolution in relation to the other institutions of American society. The new problems, responsibilities, and anxieties which have emerged from the changing sex role are discussed. The premise of creating the autonomous personality must involve one's total self and is to be accepted if one desires to accomplish universalistic freedom.—*E. B. Jaffa*

6684. Clayton, Richard R. (U. Tennessee) **Premarital sexual intercourse: A substantive test of the contingent consistency model.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4916.

6685. Gaffney, Louis. (Seattle U., Graduate School) **Psychological reflections on marital love and contraception.** *Journal of Religion & Health*, 1971(Jan), Vol. 10(1), 11-22.—After a brief review "of the complexities and difficulties of man's struggle to break with primitive taboos and superstitions as by knowledge and science he began to master nature," human love and sexuality are examined from a more modern biological science viewpoint and from the standpoint of "a first-hand report of those experiencing marriage." It is concluded that "our teaching on marital love and birth control is against the natural law," but expresses a hope that "in a more open, permissive church society" additional factual information will "find a psychological climate for reconsideration and change."—*I. Linnick.*

6686. Gottheil, Edward & Freedman, Abraham. (Jefferson Medical Coll., Philadelphia, Pa.) **Sexual beliefs and behavior of single, male medical students.** *JAMA: Journal of the American Medical Association*, 1970(May), Vol. 212(8), 1327-1332.—63 single, male, sophomore medical students volunteered to respond fully and sincerely to a 352-item questionnaire covering approximately the same topic areas described in the Kinsey Report. In addition to describing their own sexual behavior, the respondents, constituting a 57% sample of those invited to participate, indicated how they believed the average college man and woman would respond. Ss displayed a fairly conservative attitude and appeared to believe that a double standard of sexual morality for men and women still exists. Comparisons among the students' descriptions of their own and Kinsey's data did not indicate that: (a) their sexual behavior was constricted, (b) they were concerned about their sexual potency, or (c) they were naive and uninformed about sexual behavior.—*Journal summary.*

6687. Johnson, Ralph E. (Sacramento State Coll., Graduate School of Social Work) **Some correlates of**

extramarital coitus. *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 449-456. Attempted to provide an understanding of extramarital sexual involvement through an analysis of 100 middle-class, middle-aged couples. Ss who had experienced a sexual affair outside the conjugal bond and those who had not were compared. The following independent variables were utilized as a basis for this comparison: (a) opportunity for involvement; (b) perceived desire of others for involvement; (c) potential involvement; (d) justification of involvement; and (e) marital sexual satisfaction, marital adjustment, and involvement. 3 major findings emerged: (a) husbands who had experienced extramarital intercourse (EMI) had a lower degree of sexual satisfaction in their marriage than non-EMI husbands; (b) basic sex differences existed between husband and wife across all 5 independent variables used in the study; and (c) "opportunity for EMI" appears to be a particularly crucial variable in the analysis of extramarital sexuality.—*Journal abstract.*

6688. Juhasz, Anne M. (Loyola U., Chicago, Ill.) **Background factors, extent of sex knowledge and source of information.** *Journal of School Health*, 1969(Jan), Vol. 39(1), 32-39. Studied the following questions: (a) Does the source of sex information differ for students from different backgrounds? (b) Is there a relationship between scores on a sex knowledge test and background factors? and (c) How do students feel about the information they received? 365 male and 528 female university and education students answered a 2-part questionnaire. Information on source, sex, religion, community, and birth order was obtained. Printed matter is the most frequent source of information. For males, parents were the least frequent source; for girls, only for the youngest-of-4 group did parents provide the least information. Considering religion, Catholic Ss chose parents as sources less often, while Protestant Ss selected printed matter less often. More than 1/2 thought that information on sexuality had not been acquired at the best time. Whatever the background factors, 1/2 of the Ss did not have adequate knowledge of the physiology of sex.—*A. Farfaglia.*

6689. Kaats, Gilbert R. & Davis, Keith E. (U.S. Air Force Academy) **The dynamics of sexual behavior of college students.** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 390-399. In contrast to pre-1962 research is a 1967 reported premarital coital rate for college women (mostly sophomores) of 41%—a finding which was replicated in an independent follow-up study. For males, a 60% coital rate differed little from previous research. Ss were 155 male and 222 female undergraduates in the initial study, and 84 male and 97 female Ss in the follow-up. In spite of their relatively liberal sexual behavior, considerable evidence was found among both men and women for the existence of a strong double standard, a finding particularly true of males when the female involved was a potentially meaningful one. While females felt their friends approved of premarital intercourse, males felt their having had intercourse would be disapproved of by friends, family, and society alike. It appears that the female's liberal sexual behavior occurred in a setting where she perceived little support for such behavior. Evidence was also found that the more physically attractive college woman, while differing little from less attractive women in sexual attitudes and values, had more noncoital and coital experience. (26 ref.)—*Journal abstract.*

6690. Martin, J. David. (Washington State U.) **Note on a mathematical "theory" of coital frequency in marriage.** *Journal of Sex Research*—The "beans in the jar" folk model of marital coition rates was found to be implausible when examined in mathematical form. Mathematical models have the advantage that they may be tested in relatively short periods of time if data fit a predicted trend curve.—E. B. Jaffa.

6691. Middendorp, C. P., Brinkman, W., & Koomen, W. (Netherlands Organization for the Advancement of Pure Research, The Hague) **Determinants of premarital sexual permissiveness: A secondary analysis.** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 369-379.—Challenges the hypothesis by I. L. Reiss that among persons with a conservative life style there is a negative relationship between social class and premarital sexual permissiveness whereas for persons with a liberal life style, this relationship would be positive. 2 alternative rationales for the theory are presented. Results do not confirm the theory. By way of elaboration, some determinants of permissiveness regarding premarital sexual relationships were isolated: (a) religion, with liberalism-conservatism as an interpreting variable; (b) age, with liberalism-conservatism only partly interpreting; and (c) as weak determinants: residence (along the urban-rural continuum), and sex. (15 ref.)—*Journal abstract*.

6692. Reiss, Ira L. (U. Minnesota) **Comments on Middendorp's "The determinants of premarital sexual permissiveness."** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 379-380.—Replies to C. P. Middendorp, W. Brinkman, and W. Koomen's article (see PA, Vol. 46:Issue 4) in which I. L. Reiss's theory that among persons with a conservative life style there is a negative relationship between social class and premarital sexual permissiveness, whereas for persons with a liberal life style, this relationship is positive. 3 criticisms to the article are presented by Reiss: (a) the retest of his study was inadequate in the measurement of the dependent and control variables; (b) his position was inadequately understood, e.g., a generalization was designated a hypothesis, and discussion was based on only 2 of the propositions made; and (c) the article did not concentrate adequately on the basic test of the empirical relationship between social class and premarital sexual permissiveness.—P. McMillan.

6693. Robertiello, Richard C. (Long Island Center, Psychiatric Services, Forest Hills, N.Y.) **The "clitoral versus vaginal orgasm" controversy and some of its ramifications.** *Journal of Sex Research*, 1970(Nov), Vol. 6(4), 307-311.—It is felt that there is no physiological difference between a clitoral and vaginal orgasm, but when investigated psychologically there are 2 distinguishable kinds of orgasms which can be subjectively experienced. The psychological differences between the 2 are discussed. The degree of sexual mutuality and compatibility between partners is also discussed. The prevention of poor marital sexual adjustment through experimentation before marriage is recommended. Although the more mechanical and educational approaches may help to cure the situation, it is believed that the only really definitive approach is long-range intense psychoanalytic psychotherapy.—E. B. Jaffa.

6694. Schmidt, Gunter & Sigusch, Volkmar. (U. Hamburg, Inst. for Sexual Research, W. Germany) **Sex differences in responses to psychosexual stimulation by films and slides.** *Journal of Sex Research*,

1970(Nov), Vol. 6(4), 268-283.—Describes the emotional and physiosexual behavior of 128 male and 128 female students who viewed films and slides that showed petting and coitus. After presentation of the stimuli Ss were required to describe their emotional reactions through a semantic differential rating scale. Information was also obtained regarding the sexual behavior and reactions of the Ss before and after the viewing. The major results indicate that (a) men tended to describe the stimuli as more sexually arousing and favorable than the women, (b) women reacted stronger to a psychosexual stimulation, and (c) the total number of all orgasms increased significantly in the 24 hr. after the experiment. The finding that women were stimulated through the stimuli much more than the men differed from Kinsey's data. 2 explanations for the discrepancy included the validity of results obtained through Kinsey's questionnaires, and the fact that Kinsey's data were collected 20-30 yr. ago.—E. B. Jaffa.

Birth Control & Abortion

6695. Speidel, J. Joseph. (U.S. Dept. of State, Office of Population Technical Assistance Bureau, Washington, D.C.) **Knowledge of contraceptive techniques among a hospital population of low socio-economic status.** *Journal of Sex Research*, 1970(Nov), Vol. 6(4), 284-306.—A questionnaire designed to provide demographic data and to investigate opinions about ideal family size and attitudes toward birth control was administered to 89 Ss. Major findings of the survey were: (a) for most contraceptive techniques, less than 1/2 of the respondents possessed adequate knowledge to allow them to use the method effectively; (b) most respondents had a theoretical knowledge of at least 1 of 4 good contraceptive methods; (c) most of the Ss approved of family planning and desired more information and services about birth control; (d) knowledge about contraception was lower among the 15-18 yr. old age group; and (e) there was a positive correlation between greater educational attainment and increasing knowledge of contraceptives. (22 ref.)—E. B. Jaffa.

ATTITUDES & OPINIONS

6696. Albrecht, Stan L. (Washington State U.) **The effect of disclosure and reference group considerations on verbal attitude-overt behavior consistency.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4278.

6697. Brein, Michael. (U. Hawaii) **The indirect assessment of social attitudes using an object arrangement technique.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4261-4262.

6698. Brenner, Arline R. (Wayne State U.) **A test of the preference for objective vs. social information in the theory of social comparison processes.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4262.

6699. Cook, Thomas D., Burd, John R., & Talbert, Terence L. (Northwestern U.) **Cognitive, behavioral and temporal effects of confronting a belief with its costly action implications.** *Sociometry*, 1970(Sep), Vol. 33(3), 358-369.—Experimentally formed a belief and differentially confronted 81 male and female undergraduates and 60 female undergraduates with this belief and its costly action implications. The belief was

considered less true when the action implications were salient than when they were not. Furthermore, the costly action was not performed. These differences between conditions were maintained over an 8-day period, though the absolute amount of belief change decayed with time. Data are interpreted in terms of a model of "consistency plus hedonism" and a model based on "redefinition of the object of belief." The importance of these findings for the literature on the relationship of beliefs and behaviors are briefly discussed.—*Journal abstract.*

6700. Emery, Anne; Goscinski, Frank; Schroeder, Christine, & Lerner, Richard M. (Eastern Michigan U.) **College students' attitudes toward contemporary issues.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 542.—Administered a 29-item Contemporary Topics Questionnaire (CTQ) to 50 college-aged persons. Ss were retested exactly 2 days later and the average reliability coefficient was .75. A comparison of Ss' responses with those of younger adolescents previously studied with the CTQ indicated that the responses were markedly similar.—*Journal abstract.*

6701. Fitzsimmons, Stephan J. & Osburn, Hobart G. (6 Frost St., Cambridge, Mass.) **The impact of social issues and public affairs television documentaries.** *Public Opinion Quarterly*, 1968(Fall), Vol. 32, 380-397.—Investigated the effects of TV news documentaries on the viewer's knowledge level, attitudes and attitude dimensions, and potential for changing certain behaviors. 161 undergraduates were shown TV documentaries dealing with 5 different topics and were then compared to a matched control group of 152 Ss. Particular attention was paid to affects that occurred irrespective of topic, the role of initial position in mediating change, and the interrelationship among changes. "Open-mindedness" was assessed by the Rokeach Dogmatism Scale, and "intelligence" by scores on the verbal section of the Scholastic Aptitude Test (SAT). Exposure led to significant gains in information and changes in attitudes. Open-mindedness and initial position had no appreciable effect on information gain, but SAT scores were significantly related. Effects of exposure on closure of attitudes is discussed.—*Journal abstract.*

6702. Gray, Bernadette G. (St. Louis U.) **Attitudes toward law and order as a function of sex, generalized expectancy for internal versus external locus of reinforcement and dogmatism.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4994.

6703. Hampden-Turner, Charles & Whitten, Phillip. **Morals left and right.** *Psychology Today*, 1971(Apr), Vol. 4(1), 39-43, 74-76.—Surveys relating political attitudes to Kohlberg's 6 level conception of moral development were conducted in San Francisco and Boston. Key findings include: (a) radicals and liberals use different levels of moral judgment, (b) college activists are found at both the highest and the lowest stages of moral development, (c) it is seldom possible to comprehend judgments more than 1 level above one's own level, and (d) growth in moral judgment can be induced by conflicts between stages.—*E. J. Posavac.*

6704. Lee, Dorothy E. (U. Iowa) **Beliefs about self and others: A test of the dogmatism theory.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4887.

6705. Markley, O. W. (Stanford Research Inst., Menlo Park, Calif.) **Latitude of rejection: An artifact of own position.** *Psychological Bulletin*, 1971(May), Vol. 75(5), 357-359.—Proposes that the latitude of rejection

of attitude statements as measured by the method of ordered alternatives is artifactually contaminated by the extremity of own position. An unsuccessful attempt to find a more direct measure of the threshold of rejection is described. It is concluded that differential "ego" or attitudinal involvement across varying own positions cannot be validly inferred by use of either the latitude or the threshold of rejection since the latter ideally requires the property of equal intervals, which is not achieved in most applications. It is recommended that the use of the latitude measures for comparison of differential involvement between respondents be limited to responses of equal extremity of own position.—*Journal abstract.*

6706. Melamed, L. (U. Witwatersrand, Johannesburg, South Africa) **Mac Crone's race attitudes scale: Thirty years after.** *Psychologia Africana*, 1970(Oct), Vol. 13(2-3), 202-208.—Administered I. D. Mac Crone's scale of ethnic attitudes to 57 undergraduates. Results were compared with those obtained by Mac Crone in 1937. Marked changes were observed in the scale and Q values. The changes in scale values were partly explained by a change in the method of scale value assessment and by changes in Ss' perceptions of the items. Q value changes were possibly due to the smaller sample and a nonuniform shift in ratings of items. It is concluded that while the scale can still be used for ordering respondents on a continuum, it cannot be used to determine absolute position on the scale.—*Journal abstract.*

Formation & Change

6712. Dawson, John L., Law, Henry; Leung, Andrew, & Whitney, Richard E. (U. Hong Kong) **Scaling Chinese traditional-modern attitudes and the GSR**

measurement of "important" versus "un-important" Chinese concepts. *Journal of Cross-Cultural Psychology*, 1971(Mar), Vol. 2(1), 1-27.—The traditional-modern attitude theory states that individuals exposed to conflicting ideas either develop compromise attitudes or use alternate modes of inconsistency reduction. This paper presents theoretical and scaling problems involved in the Chinese Traditional-Modern Scale and a model of susceptibility to attitude change. In an accompanying GSR experiment it was found that more important concepts elicited a significantly higher level of arousal in response to attitude change in the direction of peer-group pressure. Such pressure resulted in important concepts changing in a traditional direction and unimportant concepts in a modern direction.—*A. Krichew.*

6723. Zajonc, Robert B., Swap, Walter C., Harrison, Albert A., & Roberts, Paul. (Inst. of Experimental Psychology, Oxford, England) **Limiting conditions of the exposure effect: Satiation and relativity.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 384-391.—Studied some conditions which may modify the relationship between frequency of stimulus exposure and attitude. Exp. I and II, with a total of 39 male and 45 female undergraduates, utilized a within-Ss design. Significant exposure effects when the maximum number of exposures was 9, 27, or 81 were demonstrated. There was no tendency toward satiation, even at very high exposure levels. The level of affect for the maximum number of exposures was virtually identical across experiments, suggesting the possible relative nature of the exposure effect. In Exp. III with 96 male undergraduates, frequency was manipulated on a between-Ss basis, and the exposure effect failed to occur. In Exp. IV with 112 undergraduates, exposure to stimuli was manipulated as a within-Ss variable, while affective ratings were made on stimuli of a single frequency class. A significant exposure effect resulted. Results of the 4 experiments indicate that the exposure effect will occur (a) when the frequency manipulation is performed on a within-Ss basis, and (b) on a between-Ss basis only if the stimuli differ in distribution or the scale values are unambiguous.—*Journal abstract.*

Influence & Behavior

6724. Long, Huey B. (U. Georgia) **Information sources, dogmatism, and judgmental modifications.** *Adult Education*, 1971(Win), Vol. 21(2), 37-45.—Investigated the relative influence of the status of information sources on the behavior of individuals. 36 employees from a state governmental agency were assigned to 1 of 6 categories according to the status of information source and high or low scores on the Rokeach Dogmatism Scale. Each S completed a paper and pencil test using a version of Asch's vertical line test and then an oral test in which confederates made spurious selections. Results indicate that (a) high dogmatic Ss made more judgmental modifications when receiving information from peers, and fewer when receiving information from subordinates or superiors; (b) low dogmatic Ss favored superior information sources; and (c) overall judgmental modification was higher among Ss receiving information from a peer source. Findings suggest that peer group information may be assimilated more readily than similar information from a superior in the employment situation and that dogmatism may not be a dependable variable in conforming judgmental decisions.—*Journal abstract.*

6732. Collingwood, Thomas R. (Hot Springs Rehabilitation Center, Ark.) **Toward identification of plus and minus training groups.** *Rehabilitation Research & Practice Review*, 1970(Fal), Vol. 1(4), 27-31.—Distinguishes between a plus and minus (effective vs. ineffective) training group. A plus group results in an individual's walking away from a group experience with insight of action to function more effectively in the physical, intellectual, emotional, and interpersonal spheres of life. A minus group experience is the result when the individual comes away feeling that he is less confident of himself. Certain communication variables, when present or not present, add or subtract from the process, e.g., empathy, respect, genuineness, and concreteness. The most critical variable is how well the trainer is functioning. A minus group tends to go toward extremes. It either functions to coerce members to conform or there is lack of direction. Insight without direction leads nowhere; a group experience which offers both insight and action to live a more effective life is a real source of gain.—A. M. Farfaglia.

6733. Curry, Timothy J. & Emerson, Richard M. (U. Washington) **Balance theory: A theory of interpersonal attraction?** *Sociometry*, 1970(Jun), Vol. 33(2), 216-238.—Discusses T. Newcomb's theory of acquaintance processes, the AB-X theory which concerns 2 persons, A and B, and their joint relationship to some object, X, as that relationship is perceived by 1 of them. Newcomb's study was replicated in a university dormitory containing 8-person natural living groups and extended to study the influence of variables derived from W. Chambliss's theory of attraction. 6 male and 3 female

groups were studied over an 8-wk period. Data from some of the groups paralleled Newcomb's, but revealed considerable variation between groups unexplained by the AB-X formulation. Alternative explanations are examined. It is concluded that group substructuring and perceptual-judgmental interpretations of ambiguous stimuli account for relations previously attributed to the AB-X processes. The variable most strongly associated with attraction was Chambliss's variable of success based on an interactional approach. Interpretations of this variable via social exchange theory parsimoniously achieves explanation of the data gathered on the longitudinal aspects of reciprocity in social relations, and further questions the advisability of a cognitive balance approach to long-term attraction. (30 ref.)—*Journal abstract*.

6734. Dreyer, H. & Grabitz, H. (113 Prinzess-Luise Str., Mulheim an der Ruhr, W. Germany) **Das Bewertungsquadrat: Eine Methode zur Erfassung von Einstellungsänderungen.** [The evaluation table: A method for the assessment of attitude changes.] *Psychologie und Praxis*, 1970(Jul), Vol. 14(3), 97-102.—The method intends to evaluate attitude and behavior changes in connection with leadership behavior after a series of training sessions. The questions submitted to the Ss participating in leadership training are arranged in such a way that each item is weighted against another item with a resulting favorable response (preference). Results are dichotomized on the basis of above and below median location and entered in a 2 x 2 table for statistical treatment. Pre- and postmeasures are required.—R. F. Wagner.

6735. Fisek, M. Hamit & Ofshe, Richard. (Stanford U.) **The process of status evolution.** *Sociometry*, 1970(Sep), Vol. 33(3), 327-346.—Considers the development of status structures in task-oriented discussion groups. Results with 177 male undergraduates in 3-man groups indicate that groups attain status differentiation through at least 2 distinct paths. Approximately 1/2 the groups studied displayed marked differentiation in member participation as early as the 1st min. of the group session. The remaining groups displayed near equality in initial participation and appeared to evolve dominance structures during the course of interaction. Differences between members of the 2 types of groups were found in (a) the degree of differentiation in participation at the close of the discussion session; (b) recognition of differential contributions in guidance, ideas, and ability at the task; and (c) certain aspects of the qualitative performance of group members. It is suggested that, in direct opposition to the generally accepted belief, differential participation leads to differential cognition. (24 ref.)—*Journal abstract*.

Florida) **Some effects of self-disclosure among college women.** *Journal of Humanistic Psychology*, 1970(Spring), Vol. 10(1), 84-93.—12 women designated as high disclosers and 12 as low disclosers were selected from a sample of 80 female undergraduates, on the basis of scores on a self-disclosure questionnaire. A 2-part experiment was conducted, inquiring into (a) the predictive value of the selection instrument at forecasting self-disclosure in a dyadic situation, and (b) whether an S would increase or decrease her predicted level of self-disclosure when paired with a partner who differed from her in self-disclosure. The low-disclosing Ss disclosed less to their partners than did the high-disclosing Ss when dyads were formed with like-disclosing pairs. When low disclosers were paired with high disclosers, however, the latter remained high disclosing and the low disclosers showed a significant increase in self-disclosure to their partners.—*Journal summary*.

6753. Maier, Norman R. (U. Michigan) **Male versus female discussion leaders.** *Personnel Psychology*, 1970(Win), Vol. 23(4), 455-461.—Based upon impressions gained from listening to taped problem-solving groups, the hypothesis was developed that in a situation where a standard solution is not provided the sex of the leader will determine the degree of dominance. A changing work procedure problem was used under 2 conditions: with and without a suggested solution. 384 undergraduates were divided into 96 groups of 4 Ss each (2 male and 2 female members). The group solutions were classified as worker's preference, integrative method, and leader's preference. The leader's preference solution was defined as the suggested solution provided. The integrative method was a partial solution which reflected a median position and the worker's preference was inclined toward continuation of the current practice despite its apparent inefficiency. The results, presented as percentages with a chi-square analysis, indicate that for male leaders the type of solution reached was independent of the problem situation but there was a significant difference for female leaders. When a standard solution was provided the female leader's preference was obtained 66.7% of the time while only 20.8% of the time under the facts-only condition. D. L. Dieterle.

6756. Mehrabian, Albert & Ksionzky, Sheldon. (U. California, Los Angeles) **Factors of interpersonal behavior and judgment in social groups.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 483-492.—Explored dimensions used to describe persons within closely-knit social groups. 22 male and 18 female members of a student church group completed sociometric, personality, and family make-up questionnaires. Ss used 2 independent dimensions in describing one another: another's positive and negative reinforcing qualities. The sociometric questionnaire which yielded these 2 factors is considered to be a potentially useful device for characterizing an individual within any social organization and according to a 4-fold classification: (a) positively and negatively reinforcing to others, (b) positively but not negatively reinforcing to others, (c) negatively but not positively reinforcing, and (d) neither positively nor negatively reinforcing. Correlations show that males were less affiliative and were judged as more negatively reinforcing than females. (19 ref.)—*Journal abstract*

6757. Meltzer, Leo; Morris, William N., & Hayes, Donald P. (Cornell U.) **Interruption outcomes and vocal amplitude: Explorations in social psychophysics.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 392-402.—Illustrates the utility of a social psychophysical approach—investigations of social behavior as functions of precisely measured physical aspects of communicative behavior. 120 male undergraduates served as Ss. A multiple correlation of .79 was obtained between the percentage of successful interruptions in discussions and (a) the change in interrupter's vocal amplitude from before to during the interruption, and (b) the difference between the interrupter's and interruptee's amplitude during simultaneous speech. In cross-validation, scores derived from the 2-variable regression equation correlated .60 with the observed scores. The defender's amplitude was generally a more potent determinant of interruption outcomes than the attacker's amplitude. Within any dyad, the greater the amplitude differentials, the greater was the likelihood of interruption success. Amplitude variable *a* was particularly effective in determining the outcome of very short interruptions, while *b* was effective for all but very long contests. Data suggest that certain features of verbal social interaction may be more dependent upon nonverbal cues than upon the semantic content of the utterances spoken. (24 ref.)—*Journal abstract*.

6759. Murdoch, Peter & Rosen, Dean. **Norm formation in an interdependent dyad.** *Sociometry*, 1970(Sep), Vol. 33(3), 264-275.—Studied power use, interpersonal accommodation, and trading agreements in 74 undergraduates in dyadic relationships involving a joint work task. In the trading agreements each S restrained his capability to disrupt the relationship in exchange for a similar restraint from the other S. In the relationship, a high-power S's capability to disrupt was based on a conflict of interest with a low-power S, whose capability to disrupt was based on defection to an alternative thereby hurting the high-power S. Conflict of interest, varied as high and low, was crossed with level of alternative, varied as attractive and unattractive. It was predicted and found ($p < .05$) that more interpersonal accommodation and trading agreements occurred when both Ss rather than 1 or neither S possessed high disruptive capability.—*Journal abstract*.

6768. Tomch, Aida K. (Bowling Green State U.) **Birth order and friendship associations.** *Journal of Marriage & the Family*, 1970(Aug), Vol. 32(3), 360-369.—Analyzed the relationship between birth order and friendship associations in a study based on a sample of 523 18-23 yr. old female undergraduates in the Middle East. The main finding is that last-born girls tend to visit with friends more frequently than 1st and in-between children. However, the same pattern by birth order does not always hold when intensity of interaction with friends is considered. The relatively high participation with friends on the part of last borns as compared to 1st-borns may reflect the beginning of change in the functions of the family. The apparent high friendship interaction of all the different groups studied emphasizes group solidarity based on affectivity as its major base of strength. (42 ref.)—*Journal abstract*.

6769. Well, Pierre. (Federal U. Belo Horizonte, Brazil) **Dinâmica de grupo e psicodrama no ensino da psicologia social.** [Group dynamics and psychodrama in the area of social psychology] *Arquivos Brasileiros de Psicoterapia*, 1968(Sep), Vol. 20(3), 23-29. Describes the division of psychology students into 2 psychodynamic groups, 1 which verbalized, the other which observed. The groups interacted and changed their respective roles for 10-min sessions. The participants analyzed their observations and discussed the favorable and unfavorable aspects of group dynamics. An observation program for future sessions was proposed.—P. Hertzberg.

6770. Weissman, Herbert N., Seidman, Martin, & Ritter, Kenneth. **Changes in awareness of impact upon others as a function of encounter and marathon group experiences.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 651-661. Assessed the efficacy of encounter (E) and marathon group experiences in inducing changes in perception of self and others and in personal and interpersonal dimensions of psychological functioning. Formulation and changes in attitudes toward the group were examined as well. Objective tests were administered to E and control groups consisting of

17 graduate students in psychology. Forced-choice peer-nomination rating forms and attitude questionnaires were administered at various points to the E group and the Barron-Welsh Art Scale and the Fundamental Interpersonal Relations Orientation-Behavior Scales to both groups. Peer-nomination data indicate Ss became more accurate in predicting how group members viewed them but did not change their self-perceptions in alignment with group ratings. Influence & Communication

6774. Blake, Brian F. & Heslin, Richard. (St. John's U.) **Evaluation apprehension and subject bias in experiments.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 57-63.—Examined the effect of an S's awareness that his adjustment is being evaluated upon 2 forms of bias, conformity to the E's expectancies (Rosenthal effect) and socially desirable responding. Expecting $\frac{1}{2}$ the Ss to prefer 1 kind of picture, each of 4 Es ran 32 female undergraduates (a total of 128 Ss) in a picture-rating task. The pictures varied in social desirability and the experimental context was either evaluative or nonevaluative. A significant Rosenthal effect which did not depend upon an evaluative setting appeared. Also, Ss made more socially desirable responses in an evaluative setting; this effect decayed over time during the experimental session. The validity of the Rosenthal effect and the limited bias introduced by an evaluative context are discussed.—*Journal abstract.*

6776. Collingwood, Thomas R. (Pittsburgh YMCA Counseling Service, Pa.) **Retention and retraining of interpersonal communication skills.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 294-296.—40 undergraduates, all of whom had received training in empathy, respect, genuineness, and concreteness were followed up at monthly intervals for 5 mo. Between the 3rd and 4th follow-up period, 18 Ss received 2.5 hr. of retraining. All Ss responded in writing to 8 taped client stimulus expressions, and ratings by 2 raters were accomplished using the Overall Facilitative Functional Scale. There was an initial slippage which paralleled results obtained in learning studies investigating retention. Retraining increased the Ss' functioning to peak levels.—E. J. Kronenberger.

6777. Jones, Stephen C. & Shrauger, J. Sidney. (Cornell U.) **Reputation and self-evaluation as de-**

terminants of attractiveness. *Sociometry*, 1970(Sep), Vol. 33(3), 276-286.—Investigated the effect of the correspondence between an individual's reputation and his self-evaluation on his attractiveness for others. 92 female undergraduates were given information depicting a stimulus person as a high or low worth individual, and then listened to a tape recording of the same stimulus person describing herself in a self-enhancing or self-derogating manner. Conditions were arranged in a 2×2 factorial design. Results show that Ss found the stimulus person more attractive in the high than in the low reputation condition. Furthermore, the reputation and self-evaluation conditions interacted so that the high self-evaluator tended to be more attractive than the low self-evaluator in the high reputation condition and the low self-evaluator tended to be more attractive than the high self-evaluator in the low reputation condition.—*Journal abstract.*

6779. Mehrabian, Albert. (U. California, Los Angeles) **Nonverbal betrayal of feeling.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 64-73.—In 3 experiments with 56, 48, and 41 paid undergraduates, respectively, the behaviors of deceitful communicators were explored to study the more general situations in which a person is unwilling or unable to communicate his feelings verbally. The hypothesis which received some support was that of negative affect—indicating nonverbal cues occur more frequently in deceitful than in truthful communications. Communicators exhibited less frequent movements while they were being deceitful, assumed less immediate positions relative to their addressees, talked less, talked slower, had more speech errors, and smiled more. In addition to their relevance for deceit, the findings also provide detailed information about the significance of the various nonverbal cues employed in the study.—*Journal abstract.*

6781. Rosen, Sidney & Tesser, Abraham. (U. Georgia) **On reluctance to communicate undesirable information: The MUM effect.** *Sociometry*, 1970(Sep), Vol. 33(3), 253-263.—Tested the common sense notion that people will be more reluctant to communicate information which is negative rather than positive for the recipient. 16 male and 20 female undergraduates served as Ss under conditions that eliminated (a) the recipient's prior behavior toward the communicator, (b) specified present or anticipated role relationships and/or interaction, (c) a unit relation between communicator and message, and (d) obvious anticipated rewards and punishments as a consequence of transmission (or nontransmission). Even when these factors were controlled for, the hypothesized effect was obtained ($p < .001$). The difference in communication rates as a function of whether the news was good or bad is discussed in terms of some of the costs which might inhere in the communication situation per se and of other variables which might moderate the relationship.—*Journal abstract.*

Social Perception & Motivation

6784. Albert, Stuart. (City U. New York, Graduate Center) **Interpretation of temporal trends.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 311-322.—Considers temporal experience as a set of temporal trends in which situationally defined properties are plotted over time. In Exps. I and II with 30 and 38 male and female undergraduates, the primary set of trends expressed graphic patterns of 0, moderate, or high temporal variabilities in (a) an attitude, (b) a behavior (smoking), or (c) a physical state (pollution). At the end of the time portrayed by the graph, the S was to assume an influence attempt to lower the trend. Attitudinal fluctuation prior to influence implied susceptibility to influence, whereas variation in smoking or pollution level did not. This finding is interpreted as the differential operation of homeostatic processes within situations that have explicit goals vs. situations that do not. Exp. III with 34 undergraduates and 16 volunteers, tested this explanation with a set of trends varying in slope. The use and limitations of temporal trends as a device for studying temporal experience are discussed. (18 ref.)—*Journal abstract*.

6785. Bernhardtson, Clemens S. & Fisher, Ronald J. (U. Saskatchewan, Saskatoon, Canada) **Perceptions of social desirability and frequency of occurrence of traits and the probability that the traits will be endorsed.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 571-576.—1 group of 72 students estimated the percentage of their fellow students characterized by each of 100 traits while another group of 74 students responded "true" or "false" to each trait. The correlation between the social desirability values of the traits and probability of endorsement was .80 while the correlation between the perceived frequency of occurrence of these traits and the probability of endorsement was .86. The multiple correlation of frequency of occurrence and social desirability with probability of endorsement was .88 and .10 of the variance in the endorsement variable was directly associated with variance in the social desirability variable while .37 of the variance in the endorsement variable was directly associated with variance in the frequency of occurrence variable.—*Journal abstract*.

6786. Boyle, Richard & Bonacich, Phillip. **The development of trust and mistrust in mixed-motive games.** *Sociometry*, 1970(Jun), Vol. 33(2), 123-139.—Proposes improvements for the theory of consensus formation developed by T. Scheff (see PA, Vol. 41:16254) as a solution to mixed motive games. Scheff's assumption of a "motivation to coordinate" and his failure to show how consensus develops over time are discussed. Modifications and extensions for the theory are proposed which (a) allow for the development of a noncooperative as well as a cooperative consensus; (b) account for the gradual creation or destruction of trust

between players, where the level of trust at any time is a function of the past interaction in the game and determines the future interaction; and (c) account for the 1st strategy choices with an index of "caution" based on the values in the game. (26 ref.)—*Journal abstract*.

6788. Collins, W. Andrew. (Stanford U., Inst. for Communication Research) **Idiosyncratic verbal behavior of interviewers.** *Report of the Institute for Communication Research, Stanford U.*, 1968(Oct), 18 p.—Presents evidence that interview bias exists in the response recording of open-ended questions. Content analysis of major and minor encoding patterns, idiosyncratic verbal behavior, was completed on schedules received from 2 interviewers and compared with that of 3 other interviewers. Analysis of word repetition frequency and number of words in each response yielded interviewer differences significant at the .001 level. The possibility that situational factors may have influenced these results was examined. Mean number of words/question for 3 interviewers was correlated for time of interview in the survey period, type of attempt, number of attempts, and sex of the respondent. No significant differences were found for the variables considered. Implications for the use of open-ended questions in research are discussed. Suggestions for the training of interviewers are presented. (22 ref.)—S. Knapp.

6789. Cooper, Joel. (Princeton U.) **Personal responsibility and dissonance: The role of foreseen consequences.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 354-363. Tested the proposition that personal responsibility is a necessary condition for the arousal of cognitive dissonance. A person was considered to feel personally responsible for his behavior if he voluntarily chose to act in a discrepant way and was able to foresee the consequences of his choice. 124 female undergraduates either chose or were ordered to work with a partner who, for the purpose of their interaction, had negative characteristics. The partner's negative characteristics either were or were not foreseeable prior to S's decision to work with her. It was predicted that Ss whose partners were freely chosen and whose negative traits were known beforehand would experience dissonance. Such Ss were expected to reduce their dissonance by liking their partners more as the degree of their partners' undesirable trait increased. All other Ss were expected to show an inverse relationship between their liking for their partners and the degree of their partners' negative trait. Results generally support the predictions. (20 ref.)—*Journal abstract*.

6790. Crandall, James F. (U. Idaho) **Effects of intolerance of ambiguity upon interpersonal attraction.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 550.—Reports that previous research has suggested that Ss who are intolerant of ambiguity possess characteristics producing greater likability. 2 experiments with a total of 60 Ss revealed the opposite effect. Intolerant Ss were liked less than more tolerant Ss. Even those who were themselves intolerant of ambiguity preferred others who were more tolerant. Differences in self-descriptions on the Leary Interpersonal Adjective Checklist, as a function of tolerance-intolerance of ambiguity, were similar to those found earlier.—*Author abstract*.

6791. Dorfman, Donald D., Keeve, Susan, & Saslow, Carl. (U. Iowa) **Ethnic identification: A signal detection analysis.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 373-379.—Investigated the suggestion of G. Allport and B. Kramer (see PA, Vol. 20:4204) that Ss high in anti-Semitism are more accurate at discriminating Jews from non-Jews than Ss low in anti-Semitism. Whether sensitivity in such a task is a function of anti-Semitism was tested. Ss were 108 non-Jewish undergraduates. Through signal detection theory, indexes of sensitivity and response bias were obtained from receiver-operating characteristic curves in a task requiring the identification of Jews and non-Jews from facial photos. Results show that sensitivity was greater for high-prejudiced Ss. The difference between the 2 groups was quite small. On response bias, high-prejudiced Ss were more confident of their judgments than low-prejudiced Ss, and this result was found with sensitivity held constant. High-prejudiced Ss showed slightly greater sensitivity ($p < .05$) and were significantly more confident of their judgments ($p < .001$) than low-prejudiced Ss. The existence of a prejudiced personality type is briefly considered. (17 ref.)—*Journal abstract.*

6792. Elsenhath, Sherman. (Boston U., Medical School) **Attribution of mental illness in relation to sex of respondent and sex of rated stimulus person.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 471-474.—31 male and 79 female undergraduates rated the degree of mental illness of 10 case descriptions on a 5-point scale. 2 forms were used, matched for the 10 case problems but varied for case sex. Analysis of variance yielded significant main effects for sex of the respondent and case sex. Male respondents attributed more mental illness than female respondents to the cases. The mean rating of case sex for male items was significantly higher than female items. However, 6 of the 7 items which varied sex between forms failed to differ significantly.—*Journal abstract.*

6793. Gitter, A. George & Fishman, Janet E. **Leadership: Nonverbal communication, verbal communication, race of target and sex of perceiver.** *CRC Report*, Boston U., 1969(May), No. 41, 76 p.—Investigated the effects of nonverbal communication (NVC), verbal communication (VC), race of target, and sex of perceiver on person perception. 151 Caucasian undergraduates were assigned to 8 experimental groups. Ss viewed an actor, who appeared to be Caucasian or Negro, presenting a verbally strong or weak script with strong or weak NVC. Ss then completed a 51-item rating scale on characteristics of the actor. Manipulation of NVC produced the main effects, followed by VC, race, and sex. Results of multivariate analysis indicate significant effects of (a) NVC on the perception of leadership, empathy, wise man, and nice guy; (b) VC on perception of leadership, wise man, and nice guy; (c) race on perception of empathy, wise man, and nice guy; and (d) sex on perception of leadership and nice guy. (6 p. ref.)—*Journal abstract.*

6794. Kaplan, Martin F. (Northern Illinois U.) **Dispositional effects and weight of information in impression formation.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 279-284.—Investigated response dispositions, or initial impressions existing prior to presentation of stimulus traits, in the impression formation paradigm. Response disposition, likability, and weight of stimulus traits were varied in an

experiment with 80 female undergraduates. Consistent with a weighted average model of information and initial impression integration, positive dispositions were associated with greater positivity of person impressions, independent of stimulus likability level. The magnitude of the dispositional effect diminished when greater weight was associated with stimulus traits. It is concluded that dispositions and stimulus value are averaged in forming impressions, the weight of the 2 components being inversely related. (24 ref.)—*Journal abstract.*

6795. Kaplan, Martin F. & Olczak, Paul V. (Northern Illinois U.) **Attraction toward another as a function of similarity and commonality of attitudes.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 515-521.—Hypothesized that agreement is a reinforcer, providing reward through consensual validation, and that agreement should therefore lead to greater attraction in minority opinion Ss than in majority Ss. 160 minority or majority male and female undergraduates compared attitudinal responses on an important or unimportant topic with a confederate who agreed with either 25 or 75% of responses. Further, regardless of initial position, $\frac{1}{2}$ the Ss were told they were in a minority, $\frac{1}{4}$ a majority. Confirming the hypothesis, increased agreement led to greater attraction for actual minority Ss on both topics, and for actual majority Ss only when given minority feedback on an important topic. (23 ref.)—*Journal abstract.*

6796. Martin, Dale A. (Florida State U.) **The differential effect of three dimensions of emotional meaning: Activity, valence, and potency upon identification of vocal emotional expressions.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4467-4468.

6797. Martin, J. David. (Washington State U.) **Suspicion and the experimental confederate: A study of role and credibility.** *Sociometry*, 1970(Jun), Vol. 33(2), 178-192.—Reports 5 experiments investigating the relative "suspiciousness" of persons, some of whom were confederates and some uninstructed Ss, who performed different roles in small group discussions observed by undergraduate classes. Simple deviants, who took positions different from those which were modal for their groups, and persons whose behavior (including dress) was not internally consistent, elicited more suspicion than did conformers who were consistent. Actual stooges failed to elicit significantly more suspicion than naive Ss in comparably deviant roles. Recommendations on the use of confederates in experimental studies are presented. (22 ref.)—*Journal abstract.*

6798. McGinnis, James H. & Oziel, Leon J. (Xavier U., Cincinnati, O.) **Note: Primacy effects in impression formation.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 393-394.—Primacy effects accounted for differences in the mean ratings of the 2 groups of 8 female undergraduates each. Such effects in impression formation may be the result of 2 separate but interacting processes, i.e., S. E. Asch's directed impression formation and N. H. Anderson's decreased attention hypothesis.—*Journal abstract.*

6799. Merenda, Peter F. & Mohan, Jitendra. (U. Rhode Island) **Indian students' pre- and post-election perceptions of Nixon and Humphrey.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 677-678.—Using the activity vector analysis (AVA), 34 Indian students gave their perceptions of Richard Nixon (N) and of Hubert Humphrey (H) in October 1968, and again in January 1969. 4 identical clusters were found for each condition:

N-H (pre), N-H (post), N-N, and H-H, all centered around AVA pattern 9713 (administrative pattern). However, the average interprofile correlations for these 4 conditions show statistically significant differences, suggesting the outcome of the election influenced Ss' public image of the candidates.—*Journal abstract.*

6800. Michener, H. Andrew & Tausig, Mark. (U. Wisconsin) **Usurpation and perceived support as determinants of the endorsement accorded formal leaders.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 364-372.—Manipulated 2 independent variables, usurpation of control by the leader and perception that other members support the leader, in 2×2 factorial design over 3 trials. 40 male undergraduates, participating in 3-person groups, completed a test to determine apparent skill on the judgmental task confronting the group and then held an election to select a leader. The independent variables were varied through written messages received by the Ss. Results show significant main effects on the leader's endorsement for both usurpation and perceived support. No significant interactions were found, and data indicate that these effects were mediated differently. Usurpation of control caused members to become dissatisfied with participation, while perceived lack of support created dissatisfaction with the level of goal attainment.—*Journal abstract.*

6801. Mordkoff, Arnold M. (New York U.) **The judgment of emotion from facial expression: A replication.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 74-78.—Attempts to understand different results obtained by 2 similar studies of the judgment of emotion from facial expression using the semantic differential. The 1st and major factor obtained by A. M. Mordkoff (see PA, Vol. 41:9615) was labeled forceful-submissive and differed from the evaluative factor obtained by N. J. Frijda and E. Phillipszoon (see PA, Vol. 37:4291). The hypothesis investigated and supported in the present study with 25 Ss who were not medical students, was that the results previously obtained by Mordkoff were due to special characteristics of the Ss, 1st-yr medical students, who would tend to emphasize in their ratings considerations of power, i.e., a forceful-submissive dimension.—*Journal abstract.*

6802. Parker, Randall M. (U. Missouri) **The effects of disability attribution and personality type on person perception.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3883.

6803. Shaw, Jerry I. & Skolnick, Paul. (San Fernando Valley State Coll.) **Attribution of responsibility for a happy accident.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 380-383.—Tested 2 rival theories on the attribution of responsibility for accident: (a) the defensive attribution model of E. Walster (see PA, Vol. 40:2829) which states that as an accident increases in severity, more responsibility is attributed to the victim; and (b) "the world is just" model of M. Lerner (see PA, Vol. 39:9560) which states that people believe in a reasonable fit between merit and reward. 58 male and 58 female undergraduates reacted to stories of mild and severe, positive and negative accidents. Results tend to support the defensive attribution model, but certain findings in the supplementary data suggest that other mechanisms may be in operation.—S. Knapp.

6804. Simon, William E. (Southampton Coll.) **Helping behavior in the absence of visual contact as a function of sex of person asking for help and sex of**

person being asked for help. *Psychological Reports*, 1971(Apr), Vol. 28(2), 609-610.—30 male and 31 female students each telephoned 5 males and 5 females and asked them for help. It was found that females were more likely to be helped than males. Neither males nor females were any more likely to help. Some factors regarding generalizability are discussed.—*Journal abstract.*

6805. Worchel, Stephen & Brehm, Jack W. (Duke U.) **Direct and implied social restoration of freedom.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 294-304.—Tested 3 hypotheses: (a) a threat to the freedom to make 1 of 2 choices arouses reactance and a consequent increase in desirability of the choice; (b) the increase in desirability will be reduced to the extent that the threatened freedom is directly restored by another person; and (c) the increase in desirability will be reduced to the extent that another person, under the same threat to freedom, is observed to act so as to restore his own freedom. In Exp. I with 90 male undergraduates, the S and 2 confederates acting as Ss were to make a group decision between 2 alternatives. When 1 of the confederates demanded the selection of a particular alternative, Ss tended to want the other alternative. When the 1st confederate's demand was followed by the 2nd saying that he had not yet made up his mind, Ss tended to prefer the alternative demanded by the 1st confederate. In Exp. II with 36 male undergraduates, each group member was to make his own choice between the 2 alternatives, rather than there being a group decision. When 1 confederate demanded that all in the group choose a particular alternative, Ss tended to choose the opposite alternative. When that confederate's demand was followed by the 2nd confederate saying that he had not yet made up his mind (about his own choice), Ss tended to prefer the task demanded by the 1st confederate. Results confirm the hypotheses. *Journal abstract.*

6806. Crano, William D. (Michigan State U.) **Effects of sex, response order, and expertise in conformity: A dispositional approach.** *Sociometry*, 1970(Sep), Vol. 33(3), 239-252. Examined the effects of sex of both S and confederate, response order, and perceived confederate expertise upon the establishment and maintenance of conformant responses. 64 male and female undergraduates were tested individually with 1 of 4 confederates. Sex effects proved minimal when examined across the levels of expertise. The expertise manipulation, affecting S's perception of the quality of socially derived information, proved influential in training ($p < .001$), and in the effective absence of the confederate ($p < .001$). Differences as a function of response order, affecting information quantity rather than quality, were significant in training ($p < .001$), but disappeared with the removal of the confederate. The advantage of conceptualizing conformity as a difference in the degree to which perceptual or social modes of information-weighting are activated in arriving at a decision is discussed, emphasizing variables affecting differences in information quality and quantity. (15 ref.) *Journal abstract.*

COMMUNICATION

6807. Matson, Floyd W. & Montagu, Ashley. (Eds.) (U. Hawaii) **Human dialogue: Perspectives on com-**

munication. New York, N.Y.: Free Press, 1967. xx, 595 p.—Contains 49 articles concerning the problems of human communication and representing a wide range of disciplines including psychology, sociology, anthropology, political science, linguistic philosophy, mass culture and mass media, cybernetics, and information theory. An overview is included presenting monological and dialogical approaches to communication.

6808. Meyer, Timothy P. (Ohio U.) **The effects of viewing justified and unjustified fictional versus real film violence on aggressive behavior.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4264-4265.

6809. Parker, Edwin B., Lingwood, David A., & Paisley, William J. (Stanford U., Inst. for Communication Research) **Communication and research productivity in an interdisciplinary behavioral science research area.** *Report of the Institute for Communication Research, Stanford U.*, 1968(Jul), 85 p.—Developed separate indices for the use of formal media and informal, interpersonal sources of information from data collected from 786 communications researchers. Both indices were "then included in multiple regression equations predicting research productivity from these and other factors. The major finding reported . . . is that use of informal scientific communication is the strongest single predictor of research productivity." Other consistent predictors include number of professional memberships, level of education (PhD or not), and recency of highest degree. It is concluded that facilitation of interpersonal contact among researchers should be encouraged by professional societies, employers, and relevant government agencies. The text of the questionnaire and response percentages, tables of intercorrelations, and a factor analysis of 55 variables are presented in appendices.—S. Knapp.

SMOKING & DRUG & ALCOHOL USE

6826. ———. **Potted dreams.** *British Medical Journal*, 1969(Jan), Vol. 1(5637), 133-134.—Comments and criticizes a 1969 report issued by the Hallucinogen Subcommittee of England's Home Office Advisory Committee on Drug Dependence. Issue is taken with the "recommendations that the possession, supply, and smuggling of cannabis should be subject to lighter penalties than at present" instead of concentrating on diminishing "the use of a drug that causes mental disorientation." Also, criticized is the report's failure to explore the "probable effects on society of bringing into social use another intoxicant as well as alcohol."—S. Knapp.

6827. Alsever, William D. (Syracuse U., Student Health Service) **An evaluation of marihuana for school physicians, nurses, and educators.** *Journal of School Health*, 1968(Dec), Vol. 38(10), 629-638.—Stud-

ied the facts and fallacies about marihuana in order to be of help to those who seek to counsel students. Discussion centered around 3 questions: (a) What are the benefits of marihuana? (b) What effects does it have on the mind and body? and (c) Is marihuana harmless or harmful? Efforts to contain the drug problem center on marihuana, for it is the root of drug abuse at all levels of the educational process. A glossary of drugs is included. Marihuana is the world's most popular intoxicant next to alcohol. The effects of marihuana are (a) physical (bloodshot eyes, dilated pupils, cough, dry mouth, excessive thirst, hunger, frequency of urination, and lowering of the blood pressure), and (b) mental (the "high," defined as a dreamy euphoric state of inner contentment). Marihuana is compared to tobacco and alcohol, and the differences discussed. A distinction is to be made between marihuana and hashish, which is made from pure resin and is 5-8 times as potent. Conclusions are that it is not the innocuous drug its advocates claim, penalties for possession are excessively harsh, and it should not be legalized. The difference between marihuana and other drugs up to LSD and heroin is a matter of degree, not principle. (16 ref.)—A. Farfaglia.

6828. Briscoe, Raymond G. (U. Utah) **Educational implications of differences of perception by drug-using and non-drug-using students in Davis School District.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3767-3768.

6829. Cwalina, Gustav E. (Purdue U., School of Pharmacy & Pharmaceutical Sciences) **Drug use on high school and college campuses.** *Journal of School Health*, 1968(Dec), Vol. 38(10), 638-646.—Provides information on marihuana and LSD and places the abuse of drugs in proper perspective with other abuses, e.g., overeating, alcohol, and cigarette smoking. It is asserted that the United States is a drug-oriented society; 60% of all prescriptions written are for medication whose primary intended effect is psychoactive. It is suggested that correction or prevention of illness where possible would be a more effective and beneficial course. A bad example is set for the young. The term marihuana is applied to a number of preparations which varies in potency; the least potent marihuana has a potency relationship to hashish like that of beer to 95% alcohol. 64 countries in the world have antimarihuana laws. It is asserted that marihuana is the most harmful drug because it is illegal and its use or possession carries extreme penalties. Common signs of drug abuse are listed. Programs of education and prevention in schools must be up to date, sophisticated, and have accurate facts. Exaggeration and fear tactics must be avoided. There was a significant decline in the use of LSD in 1967-1968, because of the availability of factual information.—A. Farfaglia.

6830. Frumkin, R. M., Cowan, Ronald A., & Davis, James R. (Kent State U.) **Drug use in a Midwest sample of metropolitan hinterland high school students.** *Corrective Psychiatry & Journal of Social Therapy*, 1969(Win), Vol. 15(4), 8-13.—A random sample of 386 high school students in a Michigan County were given an anonymous questionnaire about their general backgrounds and specific experiences with nonmedically prescribed drugs to determine the kinds and amounts of drugs used. Results showed less than 1 in 4 had ever tried drugs. Reasons for the growth of drug use are discussed. (15 ref.)—M. B. Merk.

6831. Johnson, Frank K. & Westman, Jack C. (U.

Wisconsin) **The teenager and drug abuse.** *Journal of School Health*, 1968(Dec), Vol. 38(10), 646-654.—Studied marihuana, LSD, amphetamines, barbiturates, and toxic inhalants. It is stated that all can promote emotional psychological dependence, but rarely physical addiction. Marihuana produces a pleasant euphoric dreamlike state in which the senses of time and space are distorted, and self-confidence is increased. The adverse effects are parallel to those of alcohol and hinge on its use as an introduction to narcotics, possible aggravation of psychopathology in a predisposed individual, and possible injury because of impaired judgment. Facts argue for new legislation to separate it from the narcotics. LSD was first used for its value in psychiatric treatment. It is an exceedingly potent drug producing dramatic, permanent, mental and physical changes following a minute dose of 25 microgm. Other hallucinogens and amphetamines can produce drug habituation with a need for increased dosage creating a risk of psychiatric complications. It is necessary to bring the adolescent into our confidence; general education of the public represents the most significant step to minimize the adverse effects of drug abuse. (28 ref.)—A. Farfaglia.

6832. Jordan, Clifford W. (Coronado School System, Calif.) **A drug abuse project.** *Journal of School Health*, 1968(Dec), Vol. 38(10), 692-695.—Organized an educational program to relieve the drug abuse program. 2 important factors were stressed: (a) students must be involved in the development, operation, and evaluation of the program; and (b) means and methods of discovering why teen-agers use drugs must be found along with educating teen-agers about drug use. The course of study is divided into 3 phases: (a) exhaustive investigation of the drug situation; junior and senior high school students work with teachers and use information of consultants from medicine, science, sociology, anthropology, psychology, education, and the advertising world; (b) an intensive study of today's teen and subteen cultures and the effect of advertising and entertainment; and (c) a broad curriculum approaching solutions to teen and subteen drug problems. This type program gets at the basis for behavior and behavior changes. "It is entirely possible that most American communities may not be able to withstand the cure of teenage drug abuse but instead may settle for the more typical educational program which depicts the dangers and consequences of drug misuse."—A. Farfaglia.

6833. Knupfer, Genevieve & Room, Robin. **Abstainers in a metropolitan community.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 108-131.—Employed data from a probability sample of San Francisco adults to "present some relevant data on the reasons for not drinking offered by abstainers, and [to] compare abstainers and drinkers on a variety of indicators of disapproval of drinking, conservative values exposure to drinking and traditionalist background." Questions, e.g., whether virtual abstainers differ very greatly on the particular variable under discussion from those who have never drunk more than moderately, are stressed. Using these methods it was found that there remained a very large difference between all classes of drinkers and both classes of virtual abstainers, on indices of exposure to other people's drinking. On the question of the ideological basis for abstaining, the majority of urban drinkers in the United States appear to belong in the nonideological category. (16 ref.)—S. R. Diamond.

6834. Kolansky, Harold & Moore, William T. (Phil-

adelphia Assn. for Psychoanalysis, Child Analysis Div. Pa.) **Effects of marihuana on adolescents and young adults.** *JAMA: Journal of the American Medical Association*, 1971(Apr), Vol. 216(3), 486-492.—Reviews the large amount of marihuana smoking in this country as well as some of the literature concerning adverse effects. 38 13-24 yr. old males and females who smoked marihuana 2 or more times weekly, were examined between 1965 and 1970, and all showed adverse psychological effects. Some also showed neurologic signs and symptoms. Of the Ss seen, there were 8 with psychoses; 4 of these attempted suicide. Included in these cases are 13 unmarried female patients who became sexually promiscuous while using marihuana. 1 of these became pregnant.—Journal summary.

6835. Lamy, Peter P. & Kitley, Mary E. **Untoward effects of drugs: I. (Including non-prescription drugs).** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 17-23.—Discusses problems that arise from the misuse of products identified as nonprescription (OTC) drugs. It is noted that many products which are actually drugs have assumed the guise of "nondrug drugs" in the minds of patients and physicians. These include aspirin, alcohol, antacids, vitamins, and certain foods. The dangers involved in home or self-medication may include an incorrect self-diagnosis, symptom suppression, excessive dosages over a prolonged period of use, and habituation. While most OTC drugs are effective and safe if taken according to directions, it is felt that there is not enough information available on their exact modes of action. Tables are presented showing (a) OTC products containing prescription drugs, (b) interactions of salicylates (aspirin) with other drugs and their influence on certain laboratory test values, and (c) the interactions of some drugs with foods. (64 ref.) P. McMillan.

6836. Midgley, J. (U. Cape Town, South Africa) **Drinking and attitudes toward drinking in a Muslim Community.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 148-158.—Studied drinking and attitudes toward drink in a Muslim community in Cape Town as a stimulus for more extensive research in other such societies. Although the area is a wine growing district, most Muslims did not drink because of strong religious and social controls. 117 households were interviewed and answered a questionnaire concerning personal data and questions on drinking. An attitude scale was devised. Those interviewed were mostly women of working-class backgrounds. Only 13% of males reported drinking: 12 once/wk., 4 daily, and the rest less frequently. There were no educational, occupational, or age patterns. Drinking was more prevalent where Muslims were interspersed among the Christians, a majority than in the traditional old quarter. Attitudes were related to the amount of education at Muslim religious schools. (18 ref.)—A. Farfaglia.

PERSONALITY

6840. Ellman, Carolyn S. (New York U.) An experimental study of the female castration complex. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(B-B), 4987-4988

6841. Nowakowska, Maria. Krytyczna analiza strategii badawczej R. B. Cattella. [A critical appreciation of research methods of R. B. Cattell.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 13-33.—Reports on R. B. Cattell's formalization of the concept of trait. The personality is described as a configuration of traits which can be obtained inductively from empirical data. The cognitive consequences of factor analysis, whose merits and restrictions determine the value of Cattell's system, are discussed. An explanation is proposed for the failure of Cattell to succeed in the complete verification of his main hypothesis of the indifference of media, i.e., that independent of the source of information, factor analysis will result in the same personality structure. Cattell's approach is interpreted as an attempt to construct a formal language in which expressions are formed according to rules determined by the choice of particular programs of factor analysis. The use of Cattell's methodology in descriptive psychology is considered. (Russian summary)—*English summary*.

PERSONALITY TRAITS & PROCESSES

6842. Hogo, Norman; Winget, Carolyn, & Gleser, Goldine C. (U. Cincinnati) Ego defenses and perceptual styles. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 599-605. Explored similarities between H. M. Voth's personality construct ego-close—ego-distant and that of W. J. Warden's field-dependent—field-independent, especially with reference to ego defenses. A measure of anxiety, the Figure Drawing Test (FDI), the Rod-and-Frame Test (RFT), and the Defense Mechanisms Inventory (DMI) was administered to 45 male and 52 female undergraduates. The correlations between anxiety scores and the FDI and RFT scores were of low order and not significant. Correlations between FDI and RFT scores and between combined FDI-RFT scores and the subcategories of the DMI tended to confirm previous findings. Predicted relations between the anxiety effect and ego defenses were obtained for men. Other significant sex differences are presented. Possible explanations for these results are discussed. (17 ref.)—*Journal abstract*.

6844. Brasil-Biaggio, Angela M. (Catholic U. Rio de Janeiro, Inst. of Psychology, Brazil) Identificação: Principais hipóteses. [Identification: Principal hypotheses.] *Arquivos Brasileiros de Psiquiatria*, 1968(Sep), Vol. 10(3), 9-22.—Presents a review of the main hypotheses concerning the identification construct. Included are (a) identification with the aggressor, (b) secondary identification, (c) secondary reinforcement (Stark, Mowrer, etc.), (d) status envy (Wentzell), (e) social power (Mussen, Dittler, Maccoby, etc.) and (f)

reciprocal role interaction (Pines). The importance of (a) masculine tendency toward identification with the order of birth, sex, and adjustment levels of a child is discussed with regard to research by Hartman and Freud. The influence of identification on the development of values and attitudes is considered important for the holistic study of personality. *—English summary*

6845. Dickstein, Louis S. & Mac Evin, Marjorie (Wellesley Coll.) Comprehension subtest of the WAIS and need for approval. *Psychological Reports*, 1971(Apr), Vol. 28(2), 482. Tested the hypothesis that the Comprehension subtest of the WAIS is a measure of social conventionality. The Marlowe-Crowne Social Desirability Scale was administered to male college graduates, 18 high and 21 low scorers then completed the WAIS and their performance were compared. Groups were not significantly different on any of the verbal subtests. An unexpected but significant open-ended difference was obtained within the high need for approval group, with those Scoring high scoring on items regarding social approval. This finding did not obtain with the low need for approval group. (6 ref.)—*abstract*

6850. Gough, Harrison G. (U. California, Berkeley) Scoring high on an index of social maturity. *Journal of Abnormal Psychology*, 1971, May, Vol. 76(2), 24. Considers social maturity as a developmental concept, with anti and individualistic being opposite ends along the continuum. Social maturity is not a component of this construct, but is a necessary condition congruent with it at higher levels of social maturity. An individual may choose to leave the mainstream of a corrupt or decadent order, whereas the more socially socialized individual may be overconcerned to the point of acquiescence in oppression and the denial of basic rights. A brief index of social maturity, developed for a prior analysis, was applied to new samples to determine

its ability to differentiate among occupational groups and to identify persons characterized by exceptional ethical sensitivity. 14 occupational groups were rated by 85 undergraduates for social maturity, using the constant sum method; mean scores on the maturity index were also computed from CPI protocols obtained from these same samples. Rho between the sets of ranks was .83. 2 illustrative case studies of men scoring unusually high on the index are presented which stress factors of rational independence, acceptance of self and others, and openness to innovative experience.—*Journal abstract.*

6851. Lubetkin, Barry S. & Lubetkin, Arvin I. (Massachusetts General Hosp., Boston) **Achievement motivation in a competitive situation: The older female graduate student.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 269-271.—Using the principle established by Atkinson and also by Weiner that individuals with high achievement motivation will remember from a series of tasks more tasks that they are not allowed to complete than those they completed (Zeigarnik effect), a procedure was developed to measure the differential Zeigarnik scores of 3 female groups. "When placed in competition with a male, older female graduate students showed significantly higher Zeigarnik scores than did groups of younger female graduate students or undergraduate females."—E. J. Kronenberger.

6852. Nawas, M. Mike. (Indiana State U.) **El estilo de vida: I. Introducción y estilo expresivo.** [Life style: I. Introduction and expressive style.] *Revista Latinoamericana de Psicología*, 1971, Vol. 3(1), 91-107.—This is the 1st of a sequence of 3 papers dealing with the concept of "life style" set forth by Alfred Adler. Life style is defined as the unique way in which an individual behaves towards a goal, and includes the spheres cognitive, affective, interpersonal, and motoric. Research on the expressive style is reviewed. (41 ref.)—V. A. Colotta.

6853. Paryzek, Lech. **Próba Interpretacji projekcji "uraz psychiczny."** [An attempt at interpretation of the notion of "psychical complex."] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 129-141.—Considers the notion of "psychical complex" as a theoretical construction designed to explain certain disturbances in an individual's adaptation to his environment. Generally, the term "complex" is used when an individual reacts impulsively and irrationally to a situation and comes into conflict with the environment. When the complex is due to a received shock, there is a tendency to react defensively. This tendency frequently becomes generalized to several different situations. Recent views of such behaviors as forms of frustration are disputed. It is suggested that the theory of psychical complexes can be linked through the theories of impulses with theories of learning and behavior and neurophysiology. (Russian summary) (32 ref.)—*English summary.*

6854. Roginska, Wilhelmina. **Ekstrawersja i introwersja w typologiach osobowości.** [Extroversion and introversion in typology of personality.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 143-163.—Traces the development of the concept of introverted and extroverted personality types. The theory of primary and secondary differentiation proposed by O. Gross and G. Heymans and the emphasis placed on the factor of emotion by F. Jordon are discussed as influencing C. Jung's later conceptualizations. Later developments by S. B. Eysenck of the concepts are described. A comparison

of extroversion and introversion in normal and neurotic persons as understood by Jung and Eysenck is presented. (Russian summary) (15 ref.)—*English summary.*

6861. Gabennesch, Howard & Hunt, Larry L. (U. Kentucky) **The relative accuracy of Interpersonal perception of high and low authoritarians.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 43-48.—Authoritarian personality theory leads us to expect to find that low authoritarians perceive others more accurately than do high authoritarians. Several experimental investigations have attempted to test this hypothesis and have concluded that high and low authoritarians do not differ in the accuracy with which they estimate the California F Scale scores of others with whom they have briefly interacted. The basic research design used in previous studies was slightly modified, making it possible to detect evidence of greater perceptual accuracy by low authoritarians when 84 undergraduates with upper and lower quartiles in their F-score distribution were studied. Low authoritarians are better able to discriminate the F-scale responses of high authoritarian others from those of low authoritarian others, they more accurately rank 5 others in terms of their total F scores, and they are more aware of the points of greatest discrepancy between high and low

authoritarian attitudes. These accuracy differentials are apparent only with respect to the 13 F-scale items which had the greatest discriminatory power for this sample. —*Journal abstract.*

6862. Good, Lawrence R. & Levin, Richard H. (Purdue U.) **Pupillary responses of repressors and sensitizers to sexual and aversive stimuli.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 631-634.—Compared the pupillary responses of repressors, neutrals, and sensitizers across neutral, aversive, male sexual and female sexual pictorial stimuli. Ss were 78 undergraduate males who were administered the Repression-Sensitization Scale. The a priori hypothesis that sensitizers would evidence a greater magnitude of pupillary dilation (or perceptual vigilance) than repressors to the sexual and aversive stimuli was not confirmed. The possibility that variability in pupillary responses rather than directionality might provide a more meaningful index of threat reaction was also contraindicated insofar as all assumptions regarding homogeneity of variance were found to be tenable. A significant effect did obtain, however, for the stimulus-content variable corroborating previous research findings that pupillary dilation is related to the affective arousal value of visual stimulation independent of brightness contrast. —*Journal abstract.*

6863. Haley, Graham A. (York U., Toronto, Ontario, Canada) **Effects of personality factors and increased eye movement on a size-matching measure of scanning.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 303-307.—Related experimentally altered eye movement levels and a variety of personality trait measures (including the Personality Research Form and the 20-item Shallow Affect Scale) to the size-matching performance of 92 male undergraduates. An experimental analogue of increased impulsivity was created by the speeding of size-matching performance. Results indicate that experimentally increased eye movement levels did not alter size estimates. Impulsivity level, both as a trait and an experimentally altered state, was an important determinant of performance, such that higher impulsivity resulted in increased overestimation. Implications of the results for the measurement and functional significance of perceptual scanning are discussed. (18 ref.) —*Journal abstract.*

6865. Hoffman, Harvey E. (Northwest Center, Philadelphia, Pa.) **Scanning, stress, and the defense profile.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 199-202.—108 Ss were divided into high-, middle-, and low-scoring groups with each of these groups being divided into thirds so that each experimental condition was represented equally at each scoring level. 3 sets of stress instructions were designed to induce 3 separate levels of anxiety or stress. A tachistoscopic procedure for determining the defense profile was utilized. The Institute for Personality and Ability Testing 8-Parallel-Form Anxiety Battery was administered to each S. Various differences between the high and low scorers were noted. "These results support the concept that cognitive controls act as determinants for selection of perceptual defenses and not as determinants of an overall defensive attitude." Results were analyzed in relation to previous findings, and explanations are presented. —*E. J. Kronenberger.*

6866. Houston, B. Kent. (U. Kansas) **Trait and situational denial and performance under stress.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 289-293.—Investigated the relations between performance on a digits backward task under stress and (a) general disposition to deny threat (trait denial), and (b) specific use of denial in the stressful situation (situational denial). Trait denial in 48 male students was measured by scores on the K. Little and J. Fisher Denial scale (see PA, Vol. 34:1040), adjusted for anxiety level. Ss high in trait denial performed better under stress but worse in the absence of stress than Ss low in trait denial. Situational denial was defined by the difference between affective response and physiological reaction to stress. Ss high in situational denial performed significantly better under stress than Ss low in situational denial. It is concluded that situational denial was more highly related to performance under stress than was trait denial. (18 ref.) —*Journal abstract.*

6867. Kangas, Barbara B. (Washington State U.) **An experimental manipulation of expressed values.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4997.

6868. Khol, Timothy. (Ohio U.) **Repression-sensitization and information-seeking behavior in a threatening social situation.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4997-4998.

6869. Phares, E. Jerry & Wilson, Kenneth G. (Kansas State U.) **Internal-external control, interpersonal attraction, and empathy.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 543-549.—Predicted that (a) internal Ss would show greater interpersonal attraction scores for an internal stranger than for an external stranger, and (b) external Ss would show a greater preference for an external stranger. Similar results were expected from an empathy measure. Results with 30 internal undergraduates support the 1st prediction. Contrary to prediction, 30 external Ss did not show a greater attraction toward an external stranger. Data in the empathy area were in general agreement. The lack of differentiation indicated by the externals is discussed. (24 ref.) —*Journal abstract.*

6870. Phares, E. Jerry; Wilson, Kenneth G., & Klyver, Nelson W. (Kansas State U.) **Internal-external control and the attribution of blame under neutral and distractive conditions.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 285-288.—Selected 32 internal and 32 external male undergraduates on the basis of scores on Rotter's Internal-External Control Scale. Ss were then failed on 2 tasks described to them as measuring intellectual functions. $\frac{1}{2}$ the Ss were failed under distractive conditions and the others under nondistractive conditions. Following this procedure, all Ss completed a blame-attribution scale. Under nondistractive conditions, internals were significantly less prone to use blaming behavior than (a) externals, and (b) internals in the distractive condition. No significant differences were found (a) between groups in the distractive condition, and (b) between externals in the 2 conditions. Variation in defensive considerations is suggested as an explanation for the latter result. —*Journal abstract.*

6871. Reyher, Joseph & Basch, Judith A. (Michigan State U.) **Degree of repression and frequency of psychosomatic symptoms.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 559-562.—Derived a rational index of repression by utilizing items from personality

inventories (the MMPI and supplementary items relating to physical illness) which reflected varying degrees of repression. Ss were 124 undergraduates, 32 of whom served as a replication group. The repression index was found to be inversely related to the frequency of somatic symptoms. This finding was successfully replicated and its theoretical and professional implications are discussed.—*Journal abstract.*

6872. Rockman, Richard M., Gold, Joel A., & Rodda, William C. (U. Maine) **Confidence rating shifts and performance as a function of locus of control, self-esteem, and initial task experience.** *Journal of Personality & Social Psychology*, 1971(Jun), Vol. 18(3), 305-310.—Studied 80 undergraduates in an experiment using a $2 \times 2 \times 2 \times 15$ factorial repeated-measures design. Internal and external Ss with high and low self-esteem were required to solve 5 easy anagrams (success condition) or 5 very difficult anagrams (failure condition) before attempting to answer 10 common anagrams of moderate difficulty level. Results indicate that high-self-esteem internals who were quite responsive to their initial task experiences performed more effectively on the last 10 problems than those who were not as responsive. An exploration of the manner in which high- and low-esteem internals react to failure is presented.—*Journal abstract.*

6873. Taccarino, John R. (Northwestern U.) **The relationship between value inconsistency and ineffective social adjustment.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4978.

6874. Wagner, Carl; Manning, Sidney, & Wheeler, Ladd. (Naval Medical Research Inst., Bethesda, Md.) **Character structure and helping behavior.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 37-42.—Explored helping behavior as a function of interactions between situational factors and helpers' personal characteristics as measured by Kipnis's "Insolence Scale." It was speculated that situational factors would elicit hedonistic responses from high insolent Ss (HiIns) and altruistic responses from low insolent Ss (LoIns), so that the effects of prior task success and failure, increased costs of helping, and observation of a selfish model would be greater among HiIns, while a generous model effect would be greater among LoIns. 108 young Navy enlisted men were given opportunities to help a dependent peer in a task situation. The Insolence \times Cost speculation was supported, with a greater reduction in helping among HiIns than among LoIns as costs increased. The Insolence \times Success-Failure speculation was virtually reversed, HiIns being unaffected by this manipulation and LoIns helping more under both success and failure than under a control condition.—*Journal abstract.*

INTELLIGENCE

6875. De Bruyn, Eric. (U. Louvain, Center for Psychodiagnostics, Belgium) **The measurement of intelligence among higher levels: II. Revision of the AH5.** *Psychologica Belgica*, 1970, Vol. 10(2), 169-179.—Describes the British test AH 5 and its 3rd revision for Dutch-speaking university freshmen AH5L3, with a verbal-numerical and a diagrammatic part. For the revised test, the intercorrelation between parts was .32. Correlations between equivalent halves were .73, .77, and .83 for Parts I and II, and total test, respectively.

Respective product-moment correlations with July examinations were .37, .18, and .36 and r biserial correlations .34, .05, and .26; r biserial correlations with July and September sessions combined, however, were .32, .49, and .52, respectively. While Part I seemed equally valid for the July session and the July-September combination, Part II was valid for the latter only. Differences in validity of both parts are discussed.—*S. Slak.*

6876. Goldman, Morton. (U. Missouri, Kansas City) **Group performance related to size and initial ability of group members.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 551-557.—Examined the relationship of group performance as a function of group size, where members within each group are of similar initial ability levels, but members in different groups are of different levels. 232 undergraduates completed the analogy part of the Terman Concept Mastery Test. 5 wk. later, Ss were formed into groups of 2-5 persons composed of all high, medium, and low scorers. Ss working as a group retook the same test. Results show that groups with different initial levels had their own unique patterns of improvement as the size of the group increased.—*Journal abstract.*

6877. Greaves, George. (Georgia State U.) **Harvey's "This I Believe" Test: Studies of reliability.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 387-390. Briefly describes the items and administration of Harvey's This I Believe test, an instrument designed for assessing level of conceptual system functioning. A number of studies relating to reliability factors are described which suggest that the test is reliable and stable.—*Journal abstract.*

6878. Grotelueschen, Arden & McQuarrie, Duncan. (U. Illinois) **Cross-validation of the Quick Word Test as an estimator of adult mental ability.** *Adult Education*, 1970(Fal), Vol. 21(1), 14-19.—Presents the results of additional analyses of data collected by A. Grotelueschen and T. Lyons (see PA, Vol. 41:8151). Ss were 84 male and 94 female 22-70 yr. old adults. A correlation of .76 was obtained for the predictor group of 89 Ss on WAIS full scale IQ scores and Quick Word Test (QWT) scores. The QWT was administered to the 89 Ss in the cross-validation group and WAIS full scale IQ scores predicted. The correlation between predicted and observed IQ scores was .72. It is concluded that the QWT is a valid instrument for estimating adult mental ability as defined by the WAIS. Descriptive information for the validation sample is given to facilitate the use of the conversion table developed in the validation analysis by adult education researchers and evaluators. *Journal abstract.*

6879. Hansen, Vagn R. **Om intelligensbegrebet og anvendelsen af intelligensprøver.** [The concept of intelligence and intelligence testing.] *Skolepsykologi*, 1970, Vol. 7(1), 26-33.—Defends the definition that intelligence is what we measure with the tests. Construction of culture-free tests is only an attempt at hiding that our culture raises children differently. (15 ref.) P. Mylov.

6880. Logue, Jessie W. (Georgia State U.) **Personal net worth as a function of economic intelligence quotient.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4334.

6881. Silverstein, A. B. (Pacific State Hosp., Pomona, Calif.) **A corrected formula for assessing the validity of WAIS, WISC, and WPPSI short forms.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 212-213.

—Beginning with McNemar's formula for the part-whole correlation which does not require access to the raw data, a formula was evolved for short forms of Wechsler instruments (WAIS, WISC, and Wechsler Preschool and Primary Scale of Intelligence). This formula takes into account the actual unreliability of the subtests and thereby corrects for the spurious element in the conventional correlation between short form and Full Scale.—E. J. Kronenberger.

6882. Stewart, Kenneth D., Wood, Dorothy Z., & Gallman, William A. (Augusta Coll.) **Concurrent validity of the Slosson Intelligence Test.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 218-220.—It was suggested that 1 of the major gaps in the concurrent validity of the Slosson Intelligence Test (SIT) is its relationship to the Wechsler scales. Likewise the norms for the SIT appear to be limited to the northeastern part of the United States. The SIT and the WISC were administered to 76 6-13 yr. olds. Data were also collected on 81 6-15 yr. olds who were administered the Stanford-Binet and the SIT. Means, standard deviations, and intercorrelations for the various measures were calculated. Regression coefficients and equations were computed. A close relationship existed between the SIT and the 2 tests, and it is concluded that the SIT is potentially a very useful addition to psychological assessment programs.—E. J. Kronenberger.

CREATIVITY

6883. Salamon, Jenő. (Főtvös Lorand U., Budapest, Hungary) **Kísérleti módszer a cselekvésben megnyilvánuló alkotó képzelet és gondolkodás tanulmányozásához.** [Experimental method for studying creative imagination and thought manifested in action.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(3), 337-354.—Examined imagination and formation of abstract concepts in the course of solving tasks involving activity. A previous method (construction of 3-dimensional models) has been completed by the addition of a new method, which provides for the following: (a) examination of objective (material) action; Ss of various ages and sex are asked to fill in a vacant square using flat plastic forms, a task which has several solutions; (b) observation of objectified (materialized) actions; Ss are asked to perform the previous task by drawing, an activity which implies a higher level of abstraction, and (c) examination of the verbalized, generalized principle on which the solving procedure is based, by recording verbal expressions in the course of task solution and by performing explorations when solutions are terminated. (Russian summary) (20 ref.) *English summary*

6884. Scott, Hugh M. (Royal Victoria Hosp., Montreal, Quebec, Canada) **The potential contributions of clinical medicine to the study of creativity.** *Perspectives in Biology & Medicine*, 1971(Win), Vol. 14(2), 319-332.—Discusses various definitions of creativity, and suggests that medicine may contribute to the study of creativity from 3 perspectives: (a) as a model, (b) as a historical analogy, and (c) by offering physicians as creative Ss for research.

PERSONALITY MEASUREMENT

6885. Bléder, J. Le "test" du prénom. [The forename "test".] *Annales Medico-Psychologiques*, 1970(Jul), Vol. 2(2), 261-266.—Asking a person about his forename

(whether he likes it or not, if others in the family are known by the same given name, etc.) will often elicit very personal and sometimes surprising responses. Although schoolchildren and adolescents often change or wish to change their names, adults seldom do so. The adopting of special names to signify a change of status (e.g., taking orders) offers another clue to their personal significance, as does the refusal by some individuals to accept diminutives. Although not a test in the psychometric sense, this simple method qualifies as a productive test of the personality.—H. King.

6886. Cloud, Jonathan & Vaughan, Graham M. (York U., Toronto, Ontario, Canada) **Using balanced scales to control acquiescence.** *Sociometry*, 1970(Jun), Vol. 33(2), 193-202.—Discusses the problem of contamination of personality inventories and attitude scales by acquiescent response styles. Research with the Wilson and Patterson Conservatism Scale, administered to 183 undergraduates, is presented. It is empirically demonstrated that the balanced keying of items is sufficient to prevent such contamination if item ambiguity is kept to a minimum. Such a scale is also described as enabling a statistical assessment of the degree to which unbalanced scales are biased by this response style. (27 ref.)—*Journal abstract*.

6887. Haward, L. C. **Personality of parachutists: II. Psychosexual profiles of American and British paratroops.** *Flight Safety*, 1969(May), Vol. 2(4), 16-17.—Describes the Krout Personal Preference Scale, devised in the 1930s by Krout and Tabin in the belief that, ultimately, development must be relied upon to explain emotional dynamics. The test determines the extent to which the S shows preferences derived from each of 10 Freudian developmental stages. A comparison of the mean profiles of American and British paratroops indicates that personalities of these 2 groups have much in common. (16 ref.)—S. R. Diamond

6888. Huckabee, Malcom W. & McGawn, W. P. (Southern Mississippi) **Differences between field independent and field dependent persons on the Stroop Color-Word Test: A failure to replicate.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 226.—58 college students were administered the Halden Figures Test and the Stroop Color-Word Test (SCWT). There was no evidence that Card III of the SCWT is an operational definition of hierarchic integration. The results were inconsistent with Bloomberg's statement regarding field independence and hierarchic integration.—E. J. Kronenberger.

6889. Jor, Victor C. (Idaho State U.) **Review of the internal-external control construct as a personality variable.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 619-640.—Reviews recent research concerning J. Rotter's concept of internal-external control of reinforcement. 12 areas are covered: (a) the Internal-External Control (IE) Scale, (b) personality, (c) attempts to control the environment, (d) achievement, (e) reactions to threat, (f) ethnic group and social class differences, (g) parent-child relationships, (h) risk-taking, (i) reactions to social stimuli, and (j) the relation of the IE measure to anxiety, adjustment, and learning. Evidence generally supports the validity of Rotter's concept. Implications and limitations of the research are presented, and suggestions for further work in specific problem areas are made. (5 p. ref.)—*Journal abstract*.

6890. McCully, Robert S. & Palmquist, Kyllikki. (Cornell U. Medical School) **Comment: The VIII**

International Congress of Rorschach and other projective techniques. *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 1-2.—Compared the 7th International Rorschach Congress held in London with the 6th Congress held in Paris. The 6th Congress was continental rather than French; there was room for impromptu meeting and interchange. The 7th Congress was British, and the easy-going atmosphere was an advantage. Suggestions for future reunions are made.—A. Farfaglia.

Inventories

6891. Gynther, Malcolm D., Fowler, Raymond D., & Erdberg, Philip. (St. Louis U.) **False positives galore: The application of standard MMPI criteria to a rural, isolated, Negro sample.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 234-237.—A socially isolated Negro sample of 32 Ss was administered a tape-recorded version of the MMPI. In general, the results indicate extreme differences between normal S responses and the responses of these Ss. For example, on the item "Evil spirits possess me at times" only 14 of 541 adults in a normative group endorsed this item but 58% of the Negro sample endorsed the item. It is suggested that there be a moratorium on interpreting profiles of Ss from this type of background. E. J. Kronenberger.

6892. Payne, Frank D. (U. Illinois, Urbana-Champaign) **Structured personality inventory items: Test-retest response consistency and item properties.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5609-5610.

6893. Sherrill, David. (Syracuse U.) **A situational restriction of the S-R Inventory of Anxiousness: Test anxiety.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 653-654.—Administered a single-statement version of the Stimulus-Response (S-R) Inventory of Anxiousness and the 16-item Test Anxiety Scale to 79 undergraduates under "test" and "no-test" conditions in an attempt to establish the validity of the S-R as a measure of test anxiety. Parallel responses to both instruments suggest the acceptability of the S-R.—*Journal abstract*.

6894. Sund, Arne. (Norwegian Armed Forces Joint Medical Services, Oslo) **Personality inventories as selective and prognostic criteria.** *Military Medicine*, 1971(Feb), Vol. 136(2), 97-104.—An adaptation of a neurosis inventory designed to reveal possible neurotic tendencies was administered to 101 19-yr-old Norwegian men who were beginning their service commitment. Follow-up information was available 13 yr. after the time of original testing. Scores on the test were then used to predict to a criterion of fit or unfit for service, level of alcoholic problems, legal offenses, whether psychiatric treatment was or was not given, whether psychiatric hospitalization was or was not necessary, and whether on the basis of an interview a psychiatrist was of the opinion that they were in need of treatment. Neither the number of neurotic answers given to a test, nor the number of serious neurotic answers were related to any of the criteria of adjustment.—G. A. Clum.

Projective Techniques

6895. Baty, Martha A. (Louisiana State U. Agricultural & Mechanical Coll.) **A comparison of three methods of recording TAT protocols.** *Dissertation*

Abstracts International, 1971(Mar), Vol. 31(9-B), 5613-5614.

6896. Berman, Alan L. (American U.) **Reply to Kuehe: On replacing the replacement technique.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 430.—Proposes that the comments by J. Kuehe (see PA, Vol. 46: Issue 4) on A. Berman's critical findings with the Felt Figures Replacement Technique are misdirected and inconsistent. The question of whether the replacement technique should be replaced is raised. Results, using this technique with young children, question the adequacy of the procedure to assess the manifestation of prepotent schemata. It is concluded that Kuehe's defense fails to respond to the critical issue.—*Author abstract*.

6897. Fernald, Peter S. & Stolurow, Katherine A. (U. New Hampshire) **Projected "eye" responses and sensitivity to the opinion of others.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 258-259.—"This study tests Piotrowski's hypothesis that in presumably non-paranoid Ss the perception of eyes in inkblots is related to a sensitivity to other's opinions." 82 college males were administered the Holtzman Inkblot Technique in a group administration. 27 items from the Social Relations scale of the Minnesota Counseling Inventory served as a measure of sensitivity to the opinions of others. The data did not support the hypothesis but it was suggested that this might be due to an inability to measure sensitivity to other's opinions through self-report. E. J. Kronenberger.

6898. Fried, Christopher. (U. Jyväskylä, Finland) **Icarianism, masochism, and sex differences in fantasy.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 38-52.—Reviewed R. May's theory that the female fantasy pattern is masochistic and moves from deprivation to enhancement, while the male fantasy pattern is Icarian and moves in the opposite direction. His study was replicated using 12 Icarian male, 12 non-Icarian male, and 12 sadomasochistic female college age Ss, 8 TAT cards, and a different scoring system in addition to May's. Results fail to support May's conclusions that (a) males fantasy abrupt failure more than females, (b) females fantasy resurgence after failure more than males, or (c) either male or female fantasies regularly move in the directions predicted. It is concluded that May's findings were produced by specific stimulus effects rather than being characteristic of spontaneous fantasy. (25 ref.)—*Journal abstract*.

6899. Hector, Heinz. (Inst. of Applied Psychology, Stockholm, Sweden) **Seven squares: Bibliography of German references 1952-67.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 502.—Describes the professional response to the Seven Squares Technique, a projective mosaic test which grew out of aptitude testing. It is considered to have potential in the observational and experimental fields of psychology and psychiatry.—P. Herizberg.

6900. Juri, Luis J. (Colegio de Psicólogos, Rosario, Argentina) **Técnicas proyectivas grupales.** [Group projective techniques.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 81-91.—Since the development of projective techniques, their use has been largely confined to individual diagnosis. Criteria are suggested for a development of comparable group projective techniques based on the need for understanding group interactional dynamics. As an example of such a test, 1 is discussed that utilizes drawings done by individual members of a group which are then used as the basis for a group-developed story. The "story" is told from the viewpoint

of the drawings rather than the persons who draw them, allowing for projection of unconscious roles. The analysis of the story reveals aspects of the patients in interaction which aid understanding of the therapy group. It is pointed out that a systematic development of the interpretative criteria used is necessary for a more complete utilization of the potential of this approach.

—S. M. Halpin.

6901. **Lieblich, Amia.** (Hebrew U., Jerusalem, Israel) **Antecedents of envy reaction.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 92-98.—Studied antecedents of envy in a multivariate design by means of semiprojective questionnaire depicting stories of the differential fates of 2 heroes. 30 undergraduates participated. Results support the predictions that the content and intensity of satisfaction of the other, as well as background information about the heroes describing the "requirements of justice" for both of them, were systematically related to the intensity of envy reaction. Theoretical implications are discussed, mainly relating to F. Heider's cognitive balance theory. —*Journal abstract.*

6902. **Mebane, Donata F. & Die, Jerry G.** (U. Houston) **A scoring system for human figure drawings as a measure of personality at Level III of the Leary Interpersonal Diagnostic System.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 385-386.—Using the T. Leary diagnostic system Draw-a-Person Test and TAT protocols for 47 male undergraduates permitted only gross discrimination of those having loving or hating, dominant or passive interpersonal attitudes. —*Journal abstract.*

6903. **Ogston, Don & Thompson, Angus.** (U. Calgary, Alberta, Canada) **Influence of social desirability upon the Group Personality Projective Test.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 677-678.—Correlated the probability of endorsing each multiple-choice item alternative of the Group Personality Projective Test with the probability of endorsing the alternative as the most socially desirable. Results with 88 university and nursing students indicate that about 53% of the measured variance of the test can be attributed to the influence of social desirability. A possible reason for the finding that social desirability has less influence on the test than has been demonstrated with true-false type inventories is discussed. Results suggest caution in evaluating the discriminative validity of the test. —*Journal abstract.*

6904. **Perczel, J.** (Ganz Mavag, Psychological Lab., Budapest, Hungary) **The Lavoëgle Self-Characterization Test: An English adaptation.** *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 22-23.—Illustrates the English adaptation by J. Perczel of the Lavoëgle Self-Characterization Test. The test comprises many boxes containing word pairs, e.g., reliable and forceful. The person taking the test must indicate in each box which of the 2 qualities corresponds most closely to his personality. —A. Fargaglia.

6905. **Stolorow, Robert D.** (Postgraduate Center for Mental Health, New York, N.Y.) **Causality-interpretation and obsessive versus hysterical functioning.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 32-37.—Predicted relationships between the relative salience of the theme of voluntary control (VC) and the relative predominance of obsessive vs. hysterical personality traits, and between the relative salience of VC and the relative predominance of obsessive vs. hysterical neurotic symptoms. A coding system for VC was applied

to TAT stories written by 89 male and 96 female undergraduates. 20 males and 20 females who scored high on VC and 20 males and 20 females who scored low on VC were given further instruments pertaining to obsessive/hysterical personality traits and neurotic symptoms. As predicted, high VC Ss were significantly more obsessive (or less hysterical) in their personality traits than low VC Ss. Predicted relationships between VC and obsessive/hysterical neurotic symptoms were not significant. (21 ref.)—*Journal abstract.*

6906. **Tolar, Alexander & Salafia, W. Ronald.** (Fairfield U., Inst. for Human Development.) **The social schemata technique as a projective device.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 423-429.—Studied the construct validity of a modified version of J. Kueth's social schemata technique. The major hypothesis was that the placement and replacement responses of pairs of silhouette figures to which unfavorable attitudes were ascribed would be more distant than the distances between figures to which more favorable characteristics were attributed. When the data of 160 male college students, performing under 5 sets, 2 directions of set, and on 2 tasks, were analyzed, the direction of set effect, i.e., favorable or unfavorable characterizations of stimuli, was significant. Positive sets led to significantly closer placements than negative sets but only on the free-placement method. Findings suggest that the replacement technique possesses far less validity than the free-placement method. (27 ref.)—*Journal abstract.*

Rorschach Test

6907. **Berry, Joyce H.** (U. Kentucky) **The Rorschach Inkblot Test as an indication of empathy.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4980-4981.

6908. **Campo, Vera & de Santos, Diana R.** (2484 Salguero St., Buenos Aires, Argentina) **A critical review of the shading responses in the Rorschach: I. Scoring problems.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 3-21.—The shading responses seem to be scored, currently, in a chaotic and often inconsistent manner. The genesis of this situation is shown through a review of the works listed in the bibliography. The confusion in this field is attributed to (a) the different meanings assigned to the term "shading"; (b) the use of aprioristic theoretical frames of reference; (c) the attribution of aprioristic symbolic meanings to the content of such responses; and (d) the meanings of anxiety. The crucial factor is thought to be the S's experience, what he does with the stimulus material, and how he elaborates it. The perceptual-experiential approach proposed by E. G. Schachtel and B. Klopfer's scoring system with some qualitative modifications is endorsed. (20 ref.)—*Journal abstract.*

6909. **Hays, James R.** (U. Georgia) **An analysis of the function of color in the Rorschach.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4994.

6910. **Rausch de Traubenberg, Nina.** *La pratique du Rorschach.* [The use of the Rorschach.] Paris, France: Presses Universitaires de France, 1970. 208 p. 12 F.

6911. **Raychaudhuri, Manas.** (Rabindra Bharati U., Calcutta, India) **Relation of creativity and sex to Rorschach M responses.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 27-31.—In an attempt to relate the Rorschach human movement (M) productivity

with sex, creativity, and test-identified psychosexual orientation of the respondent, the M responses of female and male normal, creative male and female, "non-masculine" male and "non-feminine" female Ss (N = 120) were analyzed. It was revealed that (a) high M productivity was associated with creativity, femininity in males, and with the female sex, (b) sex differences in the creative Ss, as well as masculinity in females was not associated with statistically significant differences in M productivity. Findings are accounted for mainly in terms of differential sex-role demands and the female sex's efforts to overcome indirectly the sociocultural restrictions. (19 ref.)—*Journal abstract.*

CLINICAL PSYCHOLOGY

6912. Baker, David; Telfer, Mary; Richardson, Claude E., & Clark, Gerald R. (Elwyn Inst., Pa.) **Chromosome errors in men with antisocial behavior: Comparison of selected men with Klinefelter's syndrome and XYY chromosome pattern.** *JAMA: Journal of the American Medical Association*, 1970(Nov), Vol. 214(5), 869-878.—A total of 876 males in prisons and facilities for the mentally ill and mentally retarded underwent cytogenetic screening. Of the 23 Ss identified with sex chromosome errors, 7 with 47,XYY chromosome pattern and 8 with Klinefelter's syndrome were compared. Both groups displayed tall stature and elongated lower segments; the XYY males averaged 3 in. taller than the Klinefelter males. In contrast to 47,XYY males, Klinefelter males uniformly displayed atrophic testes and buccal smears positive for sex chromatin. Facial acne, ulcerous varicosities of the legs, and neurological disorders were inconsistent features of both groups. The Klinefelter males of this series displayed a mean IQ of 80 as opposed to 84 for the 47,XYY males. A wide spectrum of criminal offenses and psychopathology, including psychosis, was manifested in both groups. (23 ref.)—*Journal summary.*

6913. Bentz, W. Kenneth & Edgerton, J. Wilbert. (U. North Carolina, Medical School, Chapel Hill) **The consequences of labeling a person as mentally ill.** *Social Psychiatry*, 1971(Jan), Vol. 6(1), 29-33.—Interviewed a random sample of 1,405 rural residents to determine their attitudes about mental illness and the extent of tolerance for the mentally ill in terms of their willingness to interact with ex-mental patients. The generally accepted proposition that rejection results when a person is labeled as mentally ill was tested. Results do not support or refute their proposition, but do indicate a trend toward greater acceptance of mental illness and the mentally ill by the public. (French & German summaries) (19 ref.)—*Journal abstract.*

6914. Boutin, Roger. (Queen Elizabeth Hosp., Montreal, Quebec, Canada) **Research "by immersion"? Diseases of the Nervous System**, 1970(Nov), Vol. 31(11, Suppl.), 105-108. Proposes that psychiatry should take steps to adapt to the changing social conditions and needs of the modern world. It is suggested that the public exposure of psychiatrists is insufficient in quantity and quality. A remedy is seen as the involvement of psychiatrists in open-line telephone conference programs and other areas of direct communication with the public.—*P. Hertzberg.*

6915. Fischer, R. (Ohio State U., Div. of Behavioral Sciences) **Über das Rhythmisch-Ornamentale im**

Halluzinatorisch-Schöpferischen. [Concerning the rhythmic-ornamental tendency in creative hallucinatory experiences.] *Confinia Psychiatrica*, 1970, Vol. 130, 1-25.—Normal, creative, schizophrenic, and ecstatic states are conceived as symbolic (i.e., perceptual-behavioral) interpretations on the perception-hallucination continuum of increasingly higher levels of arousal. These states are experienced in terms of increasing data content and increasing rate of data processing, and may result in a creative (artistic or religious) state. Eventually, however, the rate of processing cannot keep step with the ever increasing data content—the flood of inner sensation—and results in the schizophrenic "jammed computer" state. At the peak of ecstatic states, interpretive activity ceases. In biocybernetic terminology, there is no data content from without and therefore, no rate of data processing from within the only content being the reflection of the mystic in his own program. The abstract-geometric-rhythmic-ornamental tendencies which prevail during aroused states on the perception-hallucination continuum are not a function of individual talent. Creative experiences and conversion of a religious nature can also be evoked by induction—with or without drugs—a state of central (ergotropic) excitation. (53 ref.)—*English summary.*

6916. Freed, Earl X. (Veterans Administration Hosp. Alcohol Research Lab., Lyons, N.J.) **Alcoholism and manic-depressive disorders: Some perspectives** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 62-89.—Reviewed experimental and theoretical literature in order to clarify some issues on the relationship between alcoholism and manic-depressive disorders. An early link between manic-depressive disorders and alcoholism was established in the classical dipsomania where periodic irresistible cravings for alcohol were manifested. A number of researchers and clinicians have emphasized alcohol's "enabling" or "releaser" effect, and self-administration to recast emotional homeostasis. The evidence for causal relationships between alcoholism and affective disorders is unimpressive although there is substantial evidence that many manic-depressive patients use alcohol intemperately. Although investigation into effects of alcohol upon mood have tended to be frustrated, there appears to be some agreement that excessive drinking seeks a degree of tension relief in alcohol. Similarities between alcoholism and affective disorders have been stressed. (137 ref.)—*S. R. Diamond.*

6917. Gaines, Rosslyn. (U. California, Inst. of Human Development, Berkeley) **Experiencing the perceptually-deprived child.** *Journal of Learning Disabilities*, 1969(Nov), Vol. 2(11), 559-565.—Suggests that the perceptually-deprived child can experience his world more fully with intensive parental assistance. Perceptually-deprived children are defined as children having reduced perceptual information intake due to sensory limitations, e.g., blindness, deafness, neurological disorder, or retardation. Experiencing is defined as the normal human capacity to be aware of, and respond to the physical environment, including persons and groups. The unique psychological, social, and cultural difficulties which beset normal parents and prevent adequate experiencing and interaction with perceptually-deprived children are described. Solutions are proposed. (17 ref.)—*Journal abstract.*

6918. Gainotti, Guido. (U. Perugia, Clinic for Nervous & Mental Diseases, Italy) **Considerations**

doctor-patient relationship and the need for an understanding between the 2 are examined. Various types of doctor-patient relationships and the manner in which they are best achieved, i.e., according to the patient's personality, are discussed. Various analytic and conflicting theories pertaining to psychiatric semeiology are examined whereby a phenomenological approach is proposed to aid the patient in adjusting to and integrating with his world. (English summary)—*S. Maze.*

6926. **Reiss, David.** (National Inst. of Mental Health, Bethesda, Md.) **Variables of consensual experience: III. Contrasts between families of normals, delinquents and schizophrenics.** *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 73-95.—From a selective review of the literature it was predicted that: (a) normal families would experience their environment as patterned, logical, and masterable (environment-sensitive); (b) members in families of delinquents would experience themselves in their own universe where others' behavior and opinion was irrelevant (distance-sensitive); and (c) families of schizophrenics would experience the environment as confusing and hostile and would strive toward shared, stylized, and distorted notions of it as a means of mutual protection and support. An array of experimental findings, using objective measures from a card-sorting procedure, confirmed most of these predictions. It is suggested that an overall model of consensual experience remained a plausible explanation of family performance but that an individual information processing model was equally plausible. 3 distinctive contributions of the present methods and concepts are discussed: their provision of a typology of families based on objective classificatory techniques, the possibility of bypassing notions of the ideal and defective in family life, and the study of families' interaction with their communities. (40 ref.)—*Journal abstract.*

6927. **Rosenhan, David & London, Perry.** (Eds.) (Swarthmore Coll.) **Theory and research in abnormal psychology.** New York, N.Y.: Holt, Rinehart, & Winston, 1969. xvi, 552 p.—Presents a collection of papers covering the field of abnormal psychology. Topics covered include (a) development and dynamics of human behavior, (b) personality dysfunction, and (c) positive social behaviors. The book provides cross-references to major texts in abnormal psychology.

6928. **Timsit-Berthier, Martine & Dongier, M.** (State U., Liège, Belgium) **Nouvelles recherches sur la signification de la réponse photomyoclonique en psychiatrie.** [New research on the significance of the photomyoclonic response in psychiatry.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 201-220.—The photomyoclonic phenomenon is of muscular origin and is clearly differentiated from the photoconvulsive response of cortical derivation. These physiological microreflexes evoked by visual stimulation are abnormally diffused in certain patients. The authors report 115 cases found among nearly 2000 EEG examinations conducted on normal, neurotic, psychosomatic, psychotic, and organic Ss. Computer analyses were made of EEG and clinical variables. The response has 2 components: in the palpebral and periorbital muscles and in the rhythmic displacement of the eye by the oculomotor muscles. The response is significantly more often found among psychotic than neurotic patients, and is significantly more common in neurotic than in normal Ss.—*H. King.*

6929. **Veil, Cl., et al.** (Elan Research Center, Paris, France) **Bilan psychologique, socio-professionnel, psychopathologique et physiopathologique à un an de distance de l'intoxication oxycarbonée aiguë: Rapport scientifique final (mai 1970).** [Psychological, socio-professional, psychopathological and physiopathological balance-sheet one year following acute carbon monoxide intoxication: Final scientific report (May 1970).] *Annales Médico-Psychologiques*, 1970(Oct), Vol. 2(3), 343-398.—Examined 800 victims of acute intoxication by carbon monoxide 1 yr. later and their records compared with a matched control group of 20 Ss. The carbon monoxide victims generally carried identifiable sequelae of a serious and varied nature; often unknown to the person or benign, and in other instances seriously impeding activity. These aftereffects, the most characteristic of which were attested by EEG abnormalities (few normal tracings with many anomalies present, particularly slowed or irritative anomalies) and by defects in visual retention (lower scores on the Benton test), are often associated but do not appear to constitute a strictly individualized syndrome. (93 ref.)—*H. King.*

PERSONNEL

6930. ———. **Training in psychiatry.** *British Medical Journal*, 1969(Feb), Vol. 1(5641), 394-395.—The Royal Medico-Psychological Association has worked hard at the formulation of principles of psychiatric training at all levels. Employing a questionnaire and personal interviews, the opinions of individual teachers were explored. Their opinions were found to differ in the emphasis placed on psychological perceptiveness, scientific study of behavior, ability to relate to psychiatric patients, descriptive psychiatry, and therapeutic outlook. Reports were published on the present state of postgraduate education in Britain, which indicated that in a few areas the arrangements for postgraduate education in psychiatry were well ahead of those in other clinical subjects.—*I. Halev.*

6931. **Blaylock, Jerry N.** (Columbia U.) **Characteristics of nurses and of medical-surgical patients to whom they react positively and negatively.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4796-4797.

6932. **Blumberg, Richard W.** (U.S. Army MFSS, Ft. Sam Houston, Tex.) **Training clinical specialists for behavioral observation.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 568-570.—Reviews some concepts and skills associated with clinically meaningful behavioral observation. These concepts have led to a course segment on observation for training army social work/psychology specialists. A description of this instruction is given.—*Journal abstract.*

6933. **Bordeleau, J. M., Pelletier, P., Panaccio, L., & Tetreault, L.** (St-Jean-de-Dieu Hosp., Montreal, Quebec, Canada) **Authoritarian-humanitarian index in a large mental hospital.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 166-174.—Delineates authoritarian or humanitarian attitudes in a mental hospital treatment team according to age of the S, education level, amount of time spent with the patient, and seniority as a hospital employee. A questionnaire supplied data on 209 hospital employees, 15% of the population selected at random. Age is in negative correlation with humanitarian index for male and for female personnel. The older the hospital worker, the less

humanitarian is his attitude towards psychiatric patients and therefore the more authoritarian his attitude is. Education level is a more important factor, even more so than the age of the respondent. Humanitarian score is directly related to the education level. Finally, attitude of the personnel does not seem to be influenced by the length of time actually spent with the patient nor by the seniority as hospital worker. It is concluded that to render more human the attitude of personnel like that of the present sample, recruiting should favor younger persons with a higher degree of education.—*Journal summary*.

6934. Carbajal de Carozzo, Gladys. (489 Paseo Paradi, Lima, Peru) **Ein Versuch zur Erforschung der Einstellungen gegenüber psychisch Kranken.** [An investigation concerning research on negative attitudes toward the mentally ill.] *Social Psychiatry*, 1971(Jan), Vol. 6(1), 34-39.—Investigated the attitudes toward mental patients held by different staff groups at a psychiatric and neurological clinic. 12 personnel groups were distinguished according to assignments and rank, and their attitudes tested by semantic differential profiles, social distance scales, and the Custodial Mental Illness Ideology Scale. Significant differences were found correlating with occupational and educational levels. Implications of these findings for therapeutic community involvement of all clinic personnels are discussed, emphasizing the difficulties in effecting major program changes. (French summary) (28 ref.)—*English abstract*.

6935. Carkhuff, Robert R. & Griffin, Andrew H. (American International Coll.) **Selection and training of functional professionals for concentrated employment programs.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 163-165.—72 out of 150 employees were selected for a program of inservice training in interpersonal skills. The top 22 of these employees were selected for a 10-hr communication training program in empathy. The best 14 trainees then completed 100 hr. of systematic training in the effective helping process and on the skills necessary to train others to be effective helpers. Ratings of communication levels were made. The conclusions emphasized the principle of selection and the principle of training, both of which were considered effective in the development of human resources. "The application of systematic selection and training methodologies to the development of lay personnel as functional professionals makes effectiveness in social action programs possible and provides a model for the helping professions."—E. J. Kronenberger.

6936. Dell Orto, Arthur E. (Michigan State U.) **A Guttman facet analysis of the racial attitudes of rehabilitation counselor trainees.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3870.

6937. Duffy, John C. (U. Minnesota, Medical School) **Emotional Issues in the lives of physicians.** Springfield, Ill.: Charles C Thomas, 1970. ix, 92 p. \$6.50.

6938. Felton, Geraldene & Patterson, Mary G. (U. Hawaii) **Shift rotation is against nature.** *American Journal of Nursing*, 1971(Apr), Vol. 71(4), 760-763.—Explores "some of the literature on circadian rhythms to see how work assignments to various shifts by means of permanent, rotating, or on-call schedules might affect the health of nurses as well as their relationships to patients and institutions." The internal timing of the body circadian rhythms is subject to the influence of rhythmic environmental variation. Some evidences of disruption of this rhythm are restlessness, nervousness,

being awake or sleepy at inappropriate times, headache, gastrointestinal irregularities, anorexia, fatigue, slower RT, and error proneness. It is concluded that shift work and rotating assignments in the administration of nursing services are relevant to the health of nurses and their quality of practice and work performance. (15 ref.)—S. R. Diamond.

6939. Kish, George B., Solberg, Kristen B., & Uecker, Albert E. (Roanoke Coll.) **The relation of staff opinions about mental illness to ward atmosphere and perceived staff roles.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 284-287.—The Ellsworth version of the Opinions about Mental Illness Scale and the Ward Initiative Scale (WIS) for staff were administered to 77 ward personnel of 5 psychiatric wards. Various interrelationships were found. The conventional aides seemed to discourage autonomy and promoted submission whereas the nontraditional aides tended to discourage submission. The nurses felt that control of the patients is what is expected of them. Yet, conversely, the nurses were less conventional than the aides. There was a significant concern for the importance of insight and the maintenance of neatness and order on the ward.—E. J. Kronenberger.

6940. Lazarus, Arnold A. (Yale U.) **Where do behavior therapists take their troubles?** *Psychological Reports*, 1971(Apr), Vol. 28(2), 349-350.—Discusses the opinion that insight-oriented and behavioral therapies should address entirely different problems. The tendency to establish competing factions between insight and action therapy is considered to be like proclaiming that penicillin is better or worse than vitamins. Increased awareness and personal understanding through self-exploration is a viable goal in and of itself—especially for relatively well-functioning behavior therapists. It is noted that many behavior therapists are undergoing psychoanalysis or some other form of nonbehavioral psychotherapy. A table listing 23 behavior therapists' choices of personal therapy is included. *Journal abstract*.

6941. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Attitudes toward death held by staff of a suicide prevention center.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 650.—Found that 21 19-58 yr. old staff members of a suicide prevention center had fears of death similar to those held by matched controls, as measured by 2 fear of death scales, developed by D. Lester, and L. J. Collett and D. Lester. Staff members, however, showed less fear of death than controls and a more consistent attitude toward death.—*Author abstract*.

6942. Mitscherlich-Nielsen, Margarete. (20 Myliusstr., Frankfurt am Main, W. Germany) **Was macht einen guten Analytiker aus? Literaturübersicht und kritische Erwägungen.** [What makes a good analyst? Literature review and critical thoughts.] *Psyche, Stuttgart*, 1970(Aug), Vol. 24(8), 577-599.—The selection procedure to which applicants for psychoanalytic training are subjected is unsatisfactory. There is no unanimity concerning the criteria which might guide training boards. Psychoanalysis is research and therapy, yet the requirements for applicants from the therapeutic and scientific standpoints are, in a sense, at odds. The scientific status which is accorded psychoanalysis must influence the selection criteria for the new generation. The exclusion of lay analysts evidently prevents many creative talents from gaining entry to psychoanalysis.

None of the positive trait lists has withstood criticism. There is agreement only on the view that no particular traits as such (e.g., intuitive talent) are decisive, but rather their being embedded in a specific context in the applicant's personality. The analytic capacity for ego-splitting also presupposes an intact ego. A particular risk is seen in pseudonormal applicants. (48 ref.)—*Journal summary*.

6943. **Moody, Philip M.** (U. Kentucky, Medical School) **Attitudes of nurses and nursing students toward alcoholism treatment.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 172-175.—Studied attitudes in 83 nurses and nursing students toward alcoholism treatment. Ss completed a questionnaire which contained the Custodial Attitude Inventory for assessing attitudes toward alcoholics, Srole's version of the F scale of authoritarianism, and questions on the occupation and educational level of the heads of their own households. Results indicate that Ss' attitudes of authoritarianism were associated with custodial rather than humanistic attitudes in treating alcoholic patients. It is suggested that nurses who treat alcoholics (a) be recruited from middle-class backgrounds, and (b) have low authoritarian scores. Such nurses may have a more humanistic attitude, conducive to the successful rehabilitation of alcoholics.—*A. Farfaglia*.

6944. **Morris, William C.** (U. Michigan) **The information influential physician: The knowledge flow process among medical practitioners.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4973-4974.

6945. **Mudd, John W. & Siegel, Richard J.** (Columbia-Presbyterian Medical Center, New York, N.Y.) **Sexuality: The experience and anxieties of medical students.** *New England Journal of Medicine*, 1969(Dec), Vol. 281(25), 1397-1403.—397 male medical students were administered a 95-item written questionnaire and were found to be more experienced sexually than college-educated men studied by Kinsey. Nevertheless, the average student has strong desires for sex education. An important component of the anxiety that he experiences in physician-patient relations results from sexual conflict. Personal sex experience or sense of confidence is not related to propensity to sexual conflicts and anxieties. There is strong evidence that anxieties inhibit professional objectivity. These anxieties were more marked during the earlier than the later yr. of medical school. The student's sexuality fits into a constellation of emotional factors that determines the integrated quality of his personality, and it is this overall quality that facilitates or inhibits optimal physician-patient interactions and communication. (24 ref.)—*Journal abstract*.

6946. **Neulinger, John; Stein, Morris I., Schillinger, Morton, & Welkowitz, Joan.** (City Coll., City U. New York) **Perceptions of the optimally integrated person as a function of therapists' characteristics.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 375-384.—Attempted to determine whether there is a consensus for the concept of mental health. 74 male and 40 female therapists from different professional orientations in a United States sample rank ordered their views of the optimally integrated person using a 20-paragraph personality questionnaire based on H. A. Murray's need system. Although Freudians were found to be more "conservative" in certain respects than Neo-Freudians and Sullivanians, greater agreement than disagreement

was generally obtained. Variation in rank order as a function of age, length of experience, and sex of therapists are discussed as are differences within a Czechoslovakian sample of 50 therapists.—*Journal abstract*.

6947. **Paiva, Rosalia E. & Haley, Harold B.** (Medical Coll. of Ohio, Toledo) **Intellectual, personality, and environmental factors in career specialty preferences.** *Journal of Medical Education*, 1971(Apr), Vol. 46(4), 281-289.—Grouped 459 students entering 6 medical schools according to career choices: general practice, internal medicine, surgery, psychiatry, or undecided. Data were gathered from a group of tests including the Study of Values: A Scale for Measuring the Dominant Interests in Personality (SV); the Rokeach Dogmatism Scale; the Medical College Admission Test (MCAT); and an extensive biographical inventory. General practitioners represented a middle group of the MCAT, favored religious values, tended to be Protestant, and came from small towns or rural areas. Internists did not differ significantly from other Ss, but their backgrounds were similar to surgeons in religion, size of town exposure to medicine, and interest in diagnosis and treatment or research. Surgeons scored highest in economic and lowest in social values. Psychiatrists and undecided Ss scored highest on the MCAT verbal and general information scales and were generally similar. Psychiatrists, however, were more interested in interpersonal aspects of patient care and placed more importance on social and aesthetic values than all other groups. Factors affecting career preference stability are discussed.—*S. Knapp*.

6948. **Salamone, Paul R.** (Syracuse U.) **The role of the para-professional: Present and future.** *Rehabilitation Research & Practice Review*, 1970(Fal), Vol. 1(4) 1-4.—Considered the role of the paraprofessional in public rehabilitation agencies. Most rehabilitation leaders agree that there are needs in this field, and many disabled, psychiatrically handicapped, or culturally disadvantaged do not receive effective rehabilitation services. The counselor aide should not be equated with a clerical helper. He should be trained to perform tasks e.g., case finding, screening, and interviews which are primarily information gathering. They should not perform tasks, e.g., vocational assessment, psychological testing, interpretation, or vocational and psychological counseling. Paraprofessionals in rehabilitation could act as liaison between clients and agency personnel. Pearl and Reissman suggested 2 functions: a healing function (role of listener), and service function (to cut red tape and obtain needed services for his clients). The paraprofessional should earn a respectable salary that grows from year to year; his job responsibilities should increase, but he should not be sidetracked into administrative or professional activities.—*A. M. Farfaglia*.

6949. **Semenoff, Boris.** (Edinburgh U., Scotland) **The equivalence of Rorschach and Zulliger's test in a selection context.** *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 11-12.—Presents corrected data which were given in a paper at the 6th Congress of Rorschach and Projective Techniques in Paris. The paper described the use of the Rorschach and Zulliger tests in the selection of candidates for training as counselors with the Scottish Marriage Council. Findings were (a) the Zulliger was more productive, yielding 50% more responses/card; (b) "reassessing frequencies as percentage of total R. certain categories showed significantly higher incidence in one

or other test," but in many cases the percentages were close; and (c) "scoring categories discriminated significantly between Accepted and Rejected candidates." It is concluded that ink blot techniques yield distributions of responses which are closely similar. Possible objective criteria, e.g., frequencies and ratios, do not appear to function consistently.—*A. Farfaglia.*

PSYCHOTHERAPY & ANALYSIS

6951. **Forrest, Gary G.** (U. North Dakota) **Transparency as a prognostic variable in psychotherapy.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4457-4458.

6952. **Frankl, V. E.** (U. Vienna, Medical School, Austria.) **Meaninglessness: A challenge to psychologists.** *Psychologia Africana*, 1970(Oct), Vol. 13(2-3), 87-95.—Discusses feelings of meaninglessness reported by patients as manifestations of the existential vacuum. Since modern man no longer has the drives or instincts of animals or the traditions and values held by men in earlier periods to determine his actions, he often does not know what he must, should, or even wishes to do. The existential vacuum which results is considered to be an etiological factor in conformism, totalitarianism, and noogenic (nontraditional) neurosis. It is proposed that the will to meaning is the primary motivational force, that the existential vacuum is the result of frustration of this force, and that the will to power or pleasure are sublimations arising from this frustration. Meaninglessness is further considered to be 1 of the effects of reductionism, the totality of knowledge professed by specialists, especially in the sciences and education. Reductionism is described as the "nothing but" brand of nihilism, e.g., man is nothing but a computer, love is nothing but sublimated sex. It is concluded that the existential message is that man is "no-thing," that he is not an object and must never be reified. *S. Knapp.*

6953. **Freud, Anna.** (Maresfield Gardens, London, England) **Probleme der Lehranalyse.** [Problems of training analysis.] *Psyche, Stuttgart*, 1970(Aug), Vol. 24(8), 565-576. Therapeutic as well as didactic analyses heighten the sensitivity for the unconscious as a consequence of analyzing the patient's or candidate's own repressions. Beyond the requirements for patients, training analyses set the additional task for candidates to become their own objects for study. After a certain phase of training, they must not only surrender to the experience of the unconscious, but also direct their attention to psychoanalytic technique. The difference between the conscious motives of patient and training analysis (distress vs. training motivation) results in a difference of emphasis when analyzing id and ego resistances which may be decisive for the duration of the treatment. A substantial difference between the 2 types of analysis lies, however, in the circumstances surrounding the occurrence of transference. Since the training analyst and the candidate are involved in a practical professional relationship, the former always represent more than a mere shadowy figure or a mirror for the projection of infantile conflicts; this presents difficulties for the interpretation of transference phenomena.—*English summary.*

6954. **Friel, Theodore W., Berenson, Bernard G., & Mitchell, Kevin M.** **Factor analysis of therapeutic conditions for high and low functioning therapists.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 291-293.—45 therapists were rated on the variables empathy, regard, genuineness, concreteness, client self-exploration, immediacy, confrontation, and significant others during the 1st hr. of a therapy session and again during 3 randomly presented 3-min excerpts. Results are presented for low- and high-level functioning therapists. The low-functioning therapists were interacting but not attending to the client or the immediate relationship. The high-functioning therapists were capable of varying the interaction in response to the results of the interaction of the moment.—*E. J. Kronenberger.*

6955. **Gardner, Harry H.** (U. Chicago, Medical School) **Psychotherapy: Confrontation problem-solving technique.** St. Louis, Mo.: Warren H. Green, 1970. ix, 347 p. \$15.50.

6956. **Halleck, Seymour L.** (U. Wisconsin) **Therapy is the handmaiden of the status quo.** *Psychology Today*, 1971(Apr), Vol. 4(11), 30-34, 98.—All psychiatrists have realized that they could help certain patients much more if only the environment could be changed. When therapy is simply aimed at helping the patient to adjust to an unhealthy or unjust environment, the therapist is supporting the status quo. Psychiatrists and their organizations should pay close attention to the effects of political movements, technology, and public use of psychiatric opinions. Psychiatrists must stop relying exclusively on the disease model and also must train lay therapists since the medical degree is not necessary to practice good psychotherapy.—*E. J. Posavac.*

6957. **Israel, David A.** (U. Utah) **Psychotherapy: A process and outcome study in the treatment of hyperaggressive pre-adolescents.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3957-3958.

6958. **Junker, H. & Zenz, H.** (Justus Liebig U., Psychosomatische Clinic, Giessen, W. Germany) **Der Einsatz datenspeichernder und -verarbeitender Apparate für die Erforschung psychotherapeutischer Prozesse.** [The use of data storage and processing equipment in research on psychotherapeutic processes.] *Psyche, Stuttgart*, 1970(Sep), Vol. 24(9), 692-705. Transcripts of therapy sessions, which capture the verbatim interactions between patient and analyst, are of limited value for process research (and therapy supervision) because they do not consider the "vocal channel" through which affective information is transmitted. Auditory reproduction and audiovisual aids eliminate this defect, but confront the investigator with a surfeit of information so that selection criteria must be developed. Data classification and coding become major problems. The Chapple interaction chronograph paves the way for research utilizing computers which render data storage, coding, and analysis independent of investigator basis. The process analyzer connected with the language analysis apparatus in Giessen, West Germany, permits the seismographic investigation of microphenomena of the seismographic investigation of microphenomena of linguistic behavior. It functions as a sort of perceptual amplifier confronting the therapist with his own style of communication vis-à-vis the patient, and advises him of changes in the therapy process of which he may as yet be unaware. (52 ref.)—*English summary.*

6959. **Kusnetzoff, J. Carlos.** **Diferencias entre el análisis de adultos y de niños: Lenguaje verbal y**

pre-verbal. [Differences in the analysis of adults and children: Verbal and pre-verbal language.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 107-113.—1 of the major problems facing the analyst dealing with children is that of understanding their nonverbal language. The importance of nonverbal communication in adult analysis is emphasized with several examples contrasting the information gained from the content compared with the form and style of a communication. With children the role of nonverbal communication is even greater, but also is more difficult to interpret. The child displays a constantly changing, multifaceted pattern of behavior. However, in these nonverbal communications the child does display some themes quite clearly. A major difference in the interpretation of the child's nonverbal communication compared with the adult's is that with the adult one may rely primarily on auditory cues, listening for tone of voice, hesitation in speech, etc. With the child one must watch his activities, relying on his visible behavior to provide cues.—S. M. Halpin.

6960. Lesh, Terry V. (U. Lethbridge, Alberta, Canada) **Zen and psychotherapy: A partially annotated bibliography.** *Journal of Humanistic Psychology*, 1970(Spring), Vol. 10(1), 75-83.—P. Swartz.

6961. Lewis, Dorothy O. & Lewis, Melvin. (Yale U., Medical School) **Ethical and moral considerations in the management of the unwed pregnant minor.** *Social Psychiatry*, 1971(Jan), Vol. 6(1), 40-45.—Discusses 5 problem areas in the management of the unwed pregnant minor in the context of a case presentation. These areas include the rights of the individual minor herself, her infant, her parents or parent, society, and the unborn fetus. The importance of helping the minor and her parents arrive at a resolution for themselves is evident. In the event of incompetence, a recommendation is made for the formation of an advisory group. Guidelines for the tasks confronting this advisory group are offered. (French & German summaries)—*Journal abstract*.

6962. Neumann, Charles P. & Tamerin, John S. (Silver Hill Foundation, New Canaan, Conn.) **The treatment of adult alcoholics and teen-age drug addicts in one hospital: A comparison and critical appraisal of factors related to outcome.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 82-93.—Studied the different outcomes in adult alcoholics and teen-age drug addicts in an open-type hospital. Good success had been experienced with middle- and upper-class alcoholics. Adolescent drug addicts from the same social classes, however, failed to respond to the same psychotherapeutic program. Results indicate significant differences between the 2 groups regarding prognosis. In treating 22 adolescent drug addicts for 4 yr., without differentiation from other patients, it was found that in most cases Ss were brought to the hospital under pressure from law-enforcement agencies. These Ss demonstrated an unwillingness to conform, a defiant attitude toward the hospital, and a moderate amount of destruction of property and sexual acting-out. The most serious problem was their unwillingness to stop taking drugs. The alcoholics, however, came with a commitment to stop drinking.—A. Farfaglia.

6963. Ottenberg, Donald J. & Rosen, Alvin. (Eagleville Hosp. & Rehabilitation Center, Pa.) **Merging the treatment of drug addicts into an existing program for alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 94-103.—Describes a joint

program for alcoholics and drug addicts, in which addicts were integrated at a ratio of 1 addict to 3 alcoholics to provide a buffering effect. Rehabilitation centered around group therapy of an encounter type in an atmosphere of an interdisciplinary therapeutic community. In addition to group sessions of 2-4 hr. minithons of 12-18 hr. and marathons of 40-60 hr. were also used. There could be no use of violence, unauthorized drugs, or alcohol. 201 addicts (29 women) and 484 alcoholics (34 women) were treated together. Initial divisiveness gave way to successful therapeutic benefits. Results from alcoholic Ss were the same as before the merge, while drug addicts gave results that show promise, with the exception of older hard-core addicts. 6 recovered addicts from the program are working on the hospital's staff.—A. Farfaglia.

6964. Petrilowitsch, N. (U. Mainz, Neuro-Psychiatric Clinic, W. Germany) **Dialektische Psychotherapie.** [Dialectic psychotherapy.] *Psychologia Africana*, 1970(Oct), Vol. 13(2-3), 144-148.—Describes structural psychology as utilizing developmental steps, the structural level of maturity, in the characterization of human types. This system is contrasted with those using more rigid and 1 dimensional types. Special emphasis is placed on the ability of the creative personality to tolerate contrast and tension and arrive at creative synthesis. The dialectic principle applied to psychotherapy helps the patient to adopt a relative approach, rather than rigid attitudes, to areas of difficulty and provides for the enumeration of multiple alternatives. The patient acquires a knowledge of contrast through the configuration of thesis and antithesis. In interpersonal relations, nothing typical can be accepted without the atypical. This principle of complementary situational constellations is considered natural in the human condition.—*English summary*.

6965. Petrilowitsch, N. (U. Mainz, W. Germany). **Dialektische Psychotherapie zugleich ein Beitrag zur Psychopathologie von Neld und Missgunel.** [Dialectic psychotherapy along with a contribution concerning psychopathology of jealousy and ill will.] *Psychiatria Clinica*, 1970, Vol. 3(4), 193-204.—Extreme attitudes, as the analysis of habitual envy and ill will shows, have a special pathogenic potential. It is therefore, an essential psychotherapeutic task to help the patient to acquire a sense of proportion for the assessment of his environment. Dialectic therapy uses the dialectical stages of thesis, antithesis, and synthesis. The conflict laden and neurotically distorted thesis must be contrasted by the patient himself with antitheses, elaborating complete and realistic situations to illustrate them. The completions will lead necessarily to a relativization of his own initial attitude and to insight that situational constellations and human life histories show in principle a certain complementarity. Knowledge e contrario leads to coincidentia oppositorum, to a unity of opposites in the syntheses worked out and in that sense created by the patient. When the patient has learned to comprehend in each case the maximum and the minimum of possible opposites the path will have been cleared for the experience of a conciliatory solidarity, and for a sense of community of fate with his fellow humans.—*English summary*.

6966. Rosenkötter, Lutz. (6 Schulinstr., Ulm, W. Germany) **Die Verwendung des Strukturmodells und des Symbolbegriffes in der Psychoanalyse.** [The utilization of the structural model and of the symbol concept in psychoanalysis.] *Psyche*, Stuttgart, 1970(Sep).

Vol. 24(9), 641-656. —Presents a case history of a patient with hypertension in an attempt to illustrate the structural theory of the psychic apparatus and the psychoanalytic interpretation of neurosis as a disturbed formative-experiential process. The patient's disturbance consisted of a compulsively recurrent, ego-alien, unconscious misinterpretation of certain situations which reminded him of the unmastered oedipal authority situation. Following the infantile "solution" of ambivalence conflicts with the father by means of projective externalization, the conflict area remained split off from the maturational processes of the ego. The meaning of the psychosomatic reaction was a readiness for fight or flight which, defectively symbolized, corresponded to the misinterpreted situation. The revival of the infantile conflict in the transference permits the correction of the distorted symbolization. —English summary.

6967. Sahakian, William S. (Ed.) (Suffolk U.) **Psychotherapy and counseling: Studies in technique.** Chicago, Ill.: Rand McNally, 1969. xx, 568 p. —Presents salient portions of the major works of the principal contributors to the development of psychotherapy and examines a variety of psychotherapeutic systems in the light of their similar accentuations, various inflections, issues of disagreement and contradiction, and diverse fundamental approaches.

6968. Schorer, C. E. (Wayne State U., Medical School) **Improvement with and without psychotherapy.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 155-160. —Matched 55 adult psychotherapy outpatients for age, sex, diagnosis, and follow-up interval with 55 patients who had no treatment. At a mean interval of 5 yr., more treated (89%) than untreated (65%) Ss were judged improved globally and for target symptoms. Symptom relief seemed strongly correlated with the improvement of the treated; whereas, an additional enhancement of social skills was correlated with improvement of the untreated. The best predictors of improvement with treatment were signs of previous social effectiveness; whereas, for no treatment, the best predictors of improvement were the absence of depression, brief duration, and abrupt onset of symptoms. Improvement is attributed by treated Ss to improved understanding, and by the untreated to the practice of self-help. —Journal summary.

6969. Traux, Charles B. & Wittmer, Joe. (U. Florida) **The effects of the therapist focus on patient anxiety source and the interaction with therapist level of accurate empathy.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 297-299. —40 psychoneurotic patients were assigned to 1 of 4 resident psychiatrists for a 4-mo period. 20 were given a role-induction interview and the other 20 received no such role structuring. The Accurate Empathy Scale was used as a measure of therapeutic conditions. Samples of the therapy through tape recordings were obtained. 2 overall improvement measures significantly differentiated between the high and low accurate empathy groups with those high in accurate empathy indicating the better outcome. "The therapist's focus on anxiety source had a significant effect on outcome as measured in terms of the client's social ineffectiveness." The poorest outcome results were obtained when there was low accurate empathy and low focus on anxiety source. The best outcome occurred when there was high accurate empathy and a high focus on anxiety source. —E. J. Kronenberger.

6970. Widok, W. (Psychotherapeutic Clinic, Stuttgart, W. Germany) **Verlaufsbeobachtung und Erfolgs-**

beurteilung in der Psychotherapie. [Progress, observation, and evaluation in psychotherapy.] *Zeitschrift für Psychotherapie und Medizinische Psychologie*, 1970(Sep), Vol. 20(5), 184-195. —Reviews results of research by H. J. Eysenck and A. Dührssen. Principles of a special psychotherapeutic catamnesis are discussed with detailed differentiation from intratherapeutic progress observation posttherapeutic checks on success. Using the examples of significance, verification and evidence, the biopsychic duality of the therapeutic procedure and the transformation into a natural and intellectual, conceptual and judgmental system resulting from the duality are elucidated by way of interdepartmental research. The empirical possibilities for checks on success in stationary psychotherapy should be tested on a practicable model. (57 ref.) —English summary.

6971. Zifferstein, Isidore. (1819 N. Curson Ave., Los Angeles, Calif.) **Der Psychoanalytiker vor den Problemen der Gesellschaft.** [The psychoanalyst facing the problems of society.] *Psyche, Stuttgart*, 1970(Jul), Vol. 24(7), 541-552. —Regrets the retreat of analysts to their private practices in the midst of a society threatened by powerful inner and outer explosions. The common arguments favoring noninvolvement, e.g., preservation of scientific objectivity, maintenance of analytic incognito, and jeopardy of concentration on intrapsychic processes, are dismissed as rationalizations. It is concluded that social psychological mechanisms play a decisive role in the preservation of the status quo between ruler and ruled, and psychoanalysts can make an important contribution to the reactivation of these mechanisms. (15 ref.) —English summary.

Therapeutic Process

6972. Biran, S. (105 Jerusalem Ave., Jaffa, Israel) **Über Möglichkeiten und Wege, die Dauer der psychoanalytischen Behandlung zu verkürzen.** [Possibilities and means of shortening the length of psychoanalytic treatment.] *Zeitschrift für Psychosomatische Medizin und Psychoanalyse*, 1969(Jul), Vol. 15(3), 153-181. —Discusses the activity of the psychoanalyst as an accelerating factor in therapy and presents suggestions for a briefer form of analysis. Successful treatment accounts are presented as illustrative material. A patient with anxiety hysteria was asymptomatic following 169 sessions (3 1-hr sessions/wk), and an active homosexual was asymptomatic following 79 sessions (3 wk for 11 wk, followed by 46 sessions during the following 5 mo.). —B. A. Stanton.

6973. Clay, Dennis D. (Wayne State U.) **Relation of therapist interventions to freedom of communication.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4984.

6974. Safirstein, Samuel L. (Mount Sinai Medical Center, Inst. of Psychiatry, New York, N.Y.) **Institutional transference: Further consideration.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 149-154. —Presents evidence that institutional transference is a phenomenon that can be observed not only in schizophrenics, borderline conditions, and the schizoid personality, but also in personality disorders and people without a psychiatric diagnosis. A clinical example of a patient, a successful businessman who was not schizophrenic, is briefly cited; indication is given that many people could not function outside the structure of the protective institution. Those who use institutional trans-

ference in their object relations usually lack the feeling of autonomy and are unable to relate to others via individual transference. 2 kinds of transference are postulated: (a) individual transference, a higher-level transference which is not developed in some people because of lack of incentive and insufficient interpersonal interplay within the family early in life, and (b) a more primitive, less tension-provoking form of relatedness to the family as an institution and not to the different members as individuals. In this case, the individual grows up able to relate only through institutional transference.—*Journal summary.*

6975. Staples, Fred R. & Sloane, R. Bruce. (Temple U., Medical School) **Relation of speech patterns in psychotherapy to empathic ability, responsiveness to approval and disapproval.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 100-104.—8 male and 9 female outpatients (mean age = 23.8 yr.) with a neurosis or personality disorder served as Ss in a pilot study proposing to 3 hypotheses: (a) Ss who are most able to modify their behavior in order to obtain approval and avoid disapproval will show better in-therapy behavior; (b) Ss most able to perceive variations in the therapist's emotional behavior will be more aware of subtle reinforcements from the therapist and thus show better in-therapy behavior; and (c) Ss who show greater emotional reaction to the emotional distress of the therapist should be more motivated to avoid expressions of distress or disapproval by the therapist and thus produce better in-therapy behavior. Results show considerable support for the 1st and 2nd hypotheses and are less clear for the 3rd. It is suggested that direct measures of interpersonal behavior derived from behavioral analysis of the therapeutic process and may be valuable in predicting performance in therapy. *P. Hertzberg.*

6976. Traux, Charles B. & Wittmer, Joe. (U. Florida) **Patient non-personal reference during psychotherapy and therapeutic outcome.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 300-302. To test the hypothesis that patients verbalizing low levels of non-personal reference statements would show significantly better therapeutic outcome than patients verbalizing high levels of nonpersonal reference statements, measurements were taken of therapeutic outcome in 16 pairs of patients. Results indicate the importance of the patient to delve into his personal self to talk about himself and others who have meaning for him. It was noted that this process is so important that more techniques should be found to expedite vicarious learning techniques to help the patient verbalize more personal references. The patient's personal reference responses should be reinforced by the therapist to shape his verbal activity toward more self-disclosure and self-exploration.—*E. J. Kronenberger.*

Group Therapy

6977. Battegay, R. (U. Basel, Switzerland) **The group as link between sick and healthy community.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 3-10.—The amplifying effect of the group often means that it can better confront patients with their original social world than can individual psychotherapy. The individual can be observed in a social context and be guided into new encounters in a social

setting. For the inpatient, group psychotherapy combines both normalizing behavior therapy and the development of insight through analytic psychotherapy, while for the outpatient the group additionally provides a connecting link between hospital and society. It is true that individual therapy allows a deeper encounter than is possible in a group, which can skip the needs of an individual, but the group provides the sick individual with a refuge where he can both feel free and know that he is safe. Activating and imparting drive, on the one hand, and giving tranquility and support, on the other, are the antinomial principles of the therapeutic group which make it the ideal medium for social psychiatry. The group forms a bridge between the society of health and that of illness and allows the patient to experience human protection without having to pay the price of social separation. The group is the ground on which social interest can again grow but in which shelter and security can also be found.—*Journal summary.*

6978. Blay Neto, Bernardo. (Rua Itapeva, 490-110- Conj. 111, São Paulo, Brazil) **Some aspects of countertransference in group psychotherapy.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 95-98.—Discusses the countertransference aspects which are the criteria for the selection of patients for psychotherapy groups, the custom of working in the presence of Os, and the criteria for selecting such Os.—*Journal summary.*

6979. Chance, Erika. (U. California, Medical School, San Francisco) **Varieties of treatment contracts.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 91-94. The brief exploration of treatment contracts used in a variety of group methods suggests that skill in the use of so versatile a tool should be accompanied by extreme care in its application. Such care must be based upon a clear assessment of who is to be treated: the system or the individual? In either case the endeavor becomes more surely therapeutic if it is preceded by an exhaustive study of the client.—*Journal summary.*

6980. Chertoff, Harvey R. & Berger, Milton M. (Wright-Patterson Medical Center, Dayton, O.) **A technique for overcoming resistance to group therapy in psychotic patients on a community mental health service.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 53-61.—"The mental patient's self-esteem and self image have been so damaged through repeated failures in his interpersonal relationships that he is afraid to risk new ways of relating. Group psychotherapy, through multiple, simultaneous, multi-level transference reactions and the airing of differing viewpoints, provides an opportunity for a patient to experiment and to learn new methods of dealing with his conflicts and modifying his attitudes. However, the need to develop new ways to undermine resistance in patients continues to challenge us." The method of "supervised leaderless groups" is described. It is concluded that this approach provides "an excellent means of overcoming resistance while providing an opportunity for growth in social skills, self-esteem, and the sense of belonging . . . allow patients to reflect with the staff on the experience, to correct projective and perceptive distortions, and to interpret emerging themes while having a corrective emotional experience."—*J. Linnick.*

6981. Colman, Arthur D. (San Francisco Medical Center, Calif.) **Psychology of a first-baby group.**

International Journal of Group Psychotherapy, 1971(Jan), Vol. 21(1), 74-83.—Based on the assumption that "pregnancy as a normal developmental crisis requiring a new intrapsychic organization of personality" has a profound effect on the early mother-child relationship, the importance of treatment of women for whom this crisis threatens personal disintegration rather than growth was explored. The formation of the group and the dynamics in interaction are described. "In this situation of women early in their 1st pregnancy being brought together and followed through gestation, delivery, and 1st months of the mother-child relationship development, the group was intended as a discussion-learning situation rather than as a preventive mental health procedure.... This study shows that some pregnant women will, if allowed, take the opportunity to talk to each other in the presence of an interested doctor and will learn to use a group situation constructively. The group allows ventilation of anger, fears, and insecurities as well as providing the possibility of comparing notes on behavior appropriate to the new mothering role and maintenance and enhancement of the wifely one.... It seemed a valuable experience for the new mothers to see each other struggling with the same problems despite disparate prenatal attitudes." Personnel involved in maternal and child care services can learn about the psychological impact of successive "normal" life crises by observing such groups.—*I. Linnick*.

6982. **Derbolowsky, Udo.** (35 Papenhuder Str., Hamburg, W. Germany) **Mutual immunity in analysis groups and Freud's conception of abstinence.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 325-335.—Enumerates the regulatory arrangements suggested by Freud as a means of controlling the dangers which are inherent in the analytical process (i.e., restricting contact to therapy sessions, abstinence from satisfaction of the analyst's desires regarding the patient, etc.). In the process of providing psychoanalytical therapy to a group, additional problems arise from transferences, regressions, and repetitive acting out. The risk exists that patients might make other patients accessories to crimes in divulging criminal acts. Another danger is that through activated transference, patients, in their own acting out and transferences, may become guilty of actions committed against other group members. Attempts to safeguard the immunity of all group members are discussed in terms of modifications to the consideration of the group as a single organism which is treated as a single individual by the analyst.—*B. A. Stanton*.

6983. **Dies, Robert R. & Hess, Allen K.** (U. Maryland) **An experimental investigation of cohesiveness in marathon and conventional group psychotherapy.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 258-262.—Tested the validity of 2 hypotheses relating to cohesiveness in psychotherapy groups: (a) cohesiveness would show progressive improvement as a function of time spent in therapy, and (b) marathon groups would produce a greater degree of overall cohesiveness than more conventional groups. 3 experienced male therapists each conducted a 12-hr marathon and a 12-session short-term group with 5 male patients in each group. Results of audiotape ratings and analysis of questionnaires administered during the 1st, 4th, 8th, and 12th hr., and of postexperimental evaluations generally support

both predictions. Participants in the marathons discussed topics which were more personal, and displayed greater interpersonal attraction, trust, and emotional sharing.—*Journal abstract*.

6984. **Durkin, Helen E.** (Postgraduate Center for Mental Health, New York, N.Y.) **Transference in group psychotherapy revisited.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 11-22.—The concept of transference, especially its employment as a treatment technique, has often been misunderstood by its critics and misused by its practitioners. Although, as a term, it may be somewhat infelicitous, as an abstraction it unquestionably identifies clinical phenomena of crucial therapeutic significance. Its value stems from the fact that it captures the still-live past at the moment of its intrusion into the present. It is a here-and-now phenomenon with dynamic therapeutic potential. Its conceptual flexibility is attested to by the frequent changes it has undergone in the course of analytic history. In changing, it has reached a high level of complexity which renders it capable of illuminating more fully the infinite nuances of human relationships. Its adaptability to the evolution of science may still be demonstrated today in that its therapeutic usefulness is distinctly improved when the therapist views it in the perspective of modern science, as a process that has become mechanized to some degree and must be analyzed to restore its author's spontaneity. Some creative contributions to group therapy have grown out of dissatisfaction with analytic concepts: current innovations deserve appreciation and serious study. Current criticism of transference interpretation may serve the purpose, if weighed respectfully, of restoring fuller reciprocity between reason and emotion in analytic group psychotherapy. (24 ref.)—*Journal summary*.

6985. **Felger, Hubert L.** (New Jersey State Hosp., Greystone Park) **Chlorprothixene-enforced sleep for newly admitted patients with acute mental decompensation.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 46-51.—Describes the use of im administered chlorprothixene (taractan) in inducing sleep in newly admitted acutely disturbed patients. A pilot study had shown that 4 days of chlorprothixene administration (150-200 mg. im, every 3-4 hr.) produced sleep, closely paralleling physiologic slumber, without drowsiness or ataxia on arousal. Oral doses were given on the 5th day, following which all Ss were ambulatory, and most were reported as "symptom-free, friendly, social and cooperative." A modified sleep regimen was then instituted for 488 patients from 1966-1969 at a state hospital. Ss selected were those showing acute neurotic or psychotic decompensation. Overall results show that the sleep program offered a "practical treatment modality for rapidly controlling excitement, fright and aggressiveness in acute mental collapse." The program was also noted to reduce the number of persons needed to handle the patients and to shorten the total period of hospitalization. (18 ref.)—*P. McMillan*.

6986. **Fidler, Jay W. & Waxenberg, Sheldon E.** (Union County Psychiatric Clinic, Plainfield, N.J.) **A profile of group psychotherapy practice among A.G.P.A. members.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 34-43.—Attempted "to measure the patterns of group therapy practice in the United States," as well as "to delineate the types of patients in group therapy." Every 10th member of the

American Group Psychotherapy Association in the continental United States was sent a 1-page questionnaire. 73% (133) responded. "While the survey probably reflects accurately the facts about patients in groups led by therapists who see only a few groups and see them outside of custodial settings, it gives a minimal picture of large group practices and of institutional therapy." Data about marital groups, family, marathon, and childrens' groups are not included. A comparison with the findings of a 1961 survey done by Winik, Kadis, and Krasner shows "no pronounced changes" in the 1968 survey. "During the decade a shift occurred toward a lesser percentage of group therapists with medical degrees and a greater percentage with master's degrees." The trend is to work with more groups, in private practice settings. The popular number of patients in a group remains 8: session length is 90 min. Suggestions for broadening the range of this type of survey are noted.—*I. Linnick.*

6987. Friedman, Alfred S., et al. (Philadelphia Psychiatric Center, Pa.) **Therapy with families of sexually acting-out girls.** New York, N.Y.: Springer, 1971. vii, 214 p.

6988. Hotard, Stephen R. (Louisiana State U., Agricultural & Mechanical Coll.) **Increase in cognitive complexity: A comparison of human relations training and group psychotherapy.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5624-5625.

6989. Parks, James C. (U. Georgia) **An interaction process analysis of a modified marathon with voluntarily institutionalized alcoholics.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3883.

6990. Pittman, Frank S. & De Young, Carol D. (Emory U.) **The treatment of homosexuals in heterogeneous groups.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 62-73.—Concludes, from a survey of the literature, that when the therapist is not overly anxious about it, the homosexual is accepted in predominantly heterosexual groups; such groups can be useful in his treatment. It is also established that "mixed groups can provide a worthwhile adjunctive experience in treatment of homosexuality... [whereas] homogeneous homosexual groups can be as successful as individual treatment for homosexuality." To explore the effectiveness of mixed groups alone, 10 patients with problems of homosexuality are described in detail regarding past history and behavior in the group, as well as their progress in their adjustment. Among the conclusions reached are: "Homosexuality can be treated successfully, in patients who want to change, in predominantly heterosexual groups.... Problems of homosexuals can be treated successfully in mixed groups without disruptive anxiety or rejection on either side.... The presence of other homosexuals in a group is not always a bonus for a given homosexual and may create additional problems, particularly destructive rivalry.... The advantages in a homosexual's having close contact with members of the opposite sex and heterosexual members of the same sex seem very great... Homosexuals who do not want to change require a different approach from those who do.... Mixed-group therapy has a definite place in the treatment of homosexuals and homosexuality and can be used alone or in alternation or combination with marital therapy, individual therapy, homosexual couples' therapy, or perhaps even homogeneous homosexual groups."—*I. Linnick.*

6991. Rogers, Carl. (Center for Studies of the Person,

La Jolla, Calif.) **The group comes of age.** *Psychology Today*, 1969(Dec), Vol. 3(7), 27-31, 58-61.—Discusses the major events occurring in most therapy groups. Negative feelings often come out first since people seem to be testing the freedom of the group. Later people begin to reveal their own problems and begin to accept themselves. At this point the participants often refuse to accept superficial behavior on the part of those who are holding back. Many people feel positively changed after group therapy even months later. Several problems with group therapy are also discussed.—*E. J. Posavac.*

6992. Rosenfeld, David. **Nuevos enfoques en psicoterapia grupal: Introducción a las teorías de Jean P. Sartre.** [A new focus in group therapy: An introduction to the theories of Jean P. Sartre.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 41-62.—Provides an overview of Sartre's theories in hopes of providing a fresh viewpoint for the study of group development and group dynamics. For Sartre, a group does not exist as a measurable entity, but rather is an ongoing process. It is a constant struggle against "serialization" (those conditions where an individual feels himself to be merely one of many interchangeable parts with no unique self-identity), or alienation (where he feels completely alone). The development of a group provides for reciprocity in interactions, with all persons equal, yet unique. Sartre's ideas about the stages in the development of a group are discussed, and the phases seen over time in a group therapy situation are analyzed in terms of this theory.—*S. M. Halpin.*

6993. Roth, Sheldon & Stiglitz, Mark. (National Inst. of Mental Health, Bethesda, Md.) **The shared patient: Separate therapists for group and individual psychotherapy.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 44-52.—"2 therapists sharing the treatment of 1 patient is a delicate and controversial issue in psychotherapy.... This clinical material is drawn from experience with 23 patients whose age ranged from 16-30. 15 of the patients were treated in 2 different groups, each run by 1 of the authors. The remaining 8 patients were also in combined therapy with separate therapists, with the authors functioning as either their individual or group therapist." Aspects of the therapeutic process are discussed under the headings of transference effects, fusion, intensification of sibling rivalry, regression, working through, and increasing resistance to working through. "Of the 23 patients, there were none who did not reach their premorbid state: this was usually within the 1st yr. In terms of characterological change we can say that 5 (22%) had none, 12 (52%) had some, and 6 (26%) had considerable characterological change. Only 1 patient in each of the 2 groups dropped out of treatment." This technique is considered "a workable and productive form of treatment," and it is urged that therapists and patients who try this approach should stress "unambivalent commitment" to it.—*I. Linnick.*

6994. Ruitenbeek, Hendrik M. (Ed.) **Group therapy today: Styles, methods, and techniques.** New York, N.Y.: Atherton, 1969. 365 p. \$9.50.—Presents a history of group therapy and discusses the developments, successes, and current experimental techniques of the group approach to psychotherapy.

6995. Shere, Eugenia S. & Teichman, Yona. (Bar-Ilan U., Ramat-Gan, Israel) **Evaluation of group therapy with preadolescent girls: Assessment of therapeutic effects based on Rorschach records.** *International*

Journal of Group Psychotherapy, 1971(Jan), Vol. 21(1), 99-104.—The Rorschach test can be considered a valuable device for assessing therapeutic effects. In this study, a number of Rorschach variables pertaining to basic personality aspects revealed statistically significant differences, indicating the occurrence of positive changes in functioning. These Rorschach data were in agreement with the observations and clinical judgment of the therapist with regard to the girls' progress. It must be noted, however, that the observed therapeutic changes might also have been due to a maturation process over the time span of the therapeutic endeavor. Indeed, for clarification, it would have been desirable to use a matched nontherapeutic control group.—*Journal summary*.

6996. Vitalo, Raphael L. (McMaster U., Hamilton, Ontario, Canada) Teaching improved interpersonal functioning as a preferred mode of treatment. *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 166-171.—29 hospitalized patients were assigned to 1 of 3 treatment groups. Inter- and intrapersonal changes were noted. Results indicate that training was effective in increasing patients' interpersonal functioning in as few as 15 hr., and the functioning was transferable within the patients' lives. The training group displayed significant improvement in ward socialization behavior, but improved interpersonal functioning did not translate into immediate intrapersonal gain.—*E. J. Kronenberger*.

Toward the development of a screening scale for assertive training. *Psychological Reports*, 1971(Feb), Vol. 28(1), 99-107.—Designed a self-report scale to select constricted (nonassertive) candidates for assertive training. Test items sampled stimulus persons, situations, and overt and covert responses. The scale was administered to 600 undergraduates to assess reliability and validity. Coefficients of internal consistency and test-retest reliability were of acceptable magnitude. Constriction scores were related to, but distinct from, measures of dominance, deference, and autonomy. Constriction was positively associated with measures of neuroticism and fear and negatively related to extroversion and affiliation scores. Self-reports of satisfaction from environmental stimuli were inversely related to constriction scores. The assumption that constricted individuals are more complaint to external demands than their more assertive peers was supported by the finding that scholastic grades are a function of constriction level.—*Journal abstract*.

7005. McFall, Richard M. & Lillesand, Diane B. (U. Wisconsin) Behavior rehearsal with modeling and coaching in assertion training. *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 313-323.—Selected 33 nonassertive undergraduates from their scores on the Conflict Resolution Inventory and assigned them to 3 groups. Groups A and B received 2 sessions of training in refusing unreasonable requests. The training was a standardized, semiautomated, laboratory analogue of behavior rehearsal therapy, consisting of overt or covert response practice, symbolic verbal modeling, and therapist coaching. Control Group C was led to believe that the assessment procedures were a form of behavioral training. Groups A and B improved dramatically in their assertive-refusal behavior on self-report and behavioral laboratory measures compared to controls. Covert rehearsal tended to produce the greatest improvement. The experimental methodology employed is discussed as a promising approach to the evaluation and development of behavior rehearsal therapy. (20 ref.)—*Journal abstract*.

7006. McPherson, Sandra B. & Samuels, Cyrille R. (Cleveland Guidance Center, O.) Teaching behavioral methods to parents. *Social Casework*, 1971(Mar), Vol. 52(3), 148-153.—The Cleveland Child Guidance Center set up a Child Management Group which used a didactic approach emphasizing social learning and reinforcement theory. 4 sets of parents whose children were exhibiting acting-out, aggressive, or hyperkinetic behavior were selected to participate in a 10-wk "course." 2 therapists, a psychologist and a caseworker, led the sessions. Analysis of the parents' responses to the evaluation forms, aimed at understanding of their expectation and the degree to which the group met their needs, and the therapists' view of these families and treatment course showed that behavioral methods did not complete the treatment program for the families. The children felt they were being manipulated and the object of a study. The project appeared to have limited success with children and families and to provide a basis for further therapy. Behavioral techniques are an additional tool for use with distressed children and families but do not replace discussion, play techniques, and counseling.—*M. W. Linn*.

7007. Sikkels, R. J., 't Hooft, M. A., & Ramsay, R. W. (U. Amsterdam, Psychological Lab., Netherlands) De functie van ontspanning bij systematische desensitatie. [The function of relaxing in systematic desensitization.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1971(Jan), Vol. 26(1), 40-51.—Discusses the possible role of relaxation in the process of desensitization in behavior therapy for either

or both monosymptomatic and complex behavior problems. It is concluded that, to date, little attention has been paid to relaxation techniques and consequently their function in systematic desensitization has not been established. The maximum-habituation hypothesis by M. H. Lader suggests that the nonspecific effects of relaxation are probably important in the treatment of complex neurotic states.—*A. J. Ter Keurst.*

7008. **Stoner, John W.** (U. Utah) **An investigation of differences between alcoholics who volunteer and do not volunteer for aversion therapy treatment of alcoholism.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5009.

Special & Adjunctive Therapy

7009. **Abrams, Richard, et al.** (New York Medical Coll., Div. of Biological Psychiatry) **Lateralized EEG changes after unilateral and bilateral electroconvulsive therapy.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 28-33.—Obtained scalp-recorded EEG records before and after courses of unilateral or bilateral electroconvulsive therapy (ECT) in 85 depressed Ss. While the Ss did not differ in incidence of pretreatment slowing or asymmetry, marked differences were observed in the posttreatment records. The slowing seen after nondominant unilateral ECT was most pronounced over the side of treatment electrode placement (the right side in most cases), whereas the slowing after bilateral ECT was seen most often on the left. Possible anatomic, physical, and physiological bases for these findings are discussed. (18 ref.)—*Journal summary.*

7010. **Colbert, Lucy.** (Broadlawns Polk County Hosp., Des Moines, Ia.) **Debra finds herself.** *Nursing Outlook*, 1971(Jan), Vol. 19(1), 50-53. Describes the case of a 9-yr-old girl who was negative, angry, defiant, destructive, and who felt totally rejected. The nondirective play therapy method was used. This type of situation helps the child to grow by playing out his feelings of tension, frustration, insecurity, aggression, fear, bewilderment, and confusion. The role of the therapist is that of a warm, friendly, interested, and accepting person; she is not passive but is totally involved with the child and her activities and places herself at the child's level or lower. During the early sessions, the S threw things and displayed other angry behavior. She had been unwilling to risk more than a superficial involvement in the play therapy sessions to the point of not exposing her face. After 7 mo. of play therapy, she learned that it was all right to be angry, safe to relate to another person, that she was liked for herself regardless of her actions, and that someone understood her misery. Essentially she had learned to accept herself.—*A. M. Farfaglia.*

7011. **Conn, Jacob H.** (Johns Hopkins U., Medical School) **Hypnosynthesis.** *American Journal of Clinical Hypnosis*, 1971(Jan), Vol. 13(3), 208-221.—Provides a description of the author's views of hypnotherapy, illustrated by case histories.—*M. V. Kline.*

7012. **Hartland, John.** **The approach to hypnotherapy: "Permissive" or otherwise?** *American Journal of Clinical Hypnosis*, 1971(Jan), Vol. 13(3), 153-154.—Questions the general applicability of the "permissive" approach to hypnotherapy. Certain national or cultural differences are noted. It is stressed that the method selected must be suitable, not only to the personality of the patient, but also to that of the therapist.—*M. V. Kline.*

7013. **Jakab, Irene & Howard, Margaret C.** (McLean Hosp., Belmont, Mass.) **Art therapy with a 12-year-old girl who witnessed suicide and developed school phobia.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 309-324.—Describes the therapeutic management of a patient, who when coming home from school witnessed the suicide of a man who shot himself in the head with a sawed-off shotgun. A mo. later she refused to go to school and exhibited panic and rage if attempts were made to force her. She did not speak of the traumatic event. In the hospital she was negativistic and uncooperative in verbal psychotherapy. After having drawn the picture of the suicide scene, she became able to talk about it and soon joined the school classes within the hospital. In this case, art therapy was the most suitable method for dealing with the phobic symptoms for it was the least threatening type of expression for the patient. It also served as catharsis. In art therapy she was able to deal with the repressed memory which brought into focus her own aggressive feelings and the separation anxiety. The dynamic factors in the patient's present psychological constellation and her life situation which underlie the illness are discussed as well as the choice of symptom, and the specific effects of the art therapy (28 ref.)—*Journal summary.*

7014. **Moorefield, C. W.** (U. Virginia Hosp.) **The use of hypnosis and behavior therapy in asthma.** *American Journal of Clinical Hypnosis*, 1971(Jan), Vol. 13(3), 162-168.—9 patients with asthma were treated with hypnosis and behavior therapy. All Ss showed subjective improvement to a rather marked degree, except for 1 S who has had 3 slight attacks of asthma since the onset of her treatment.—*M. V. Kline.*

Amsterdam, Netherlands) **Hypnosis as a tool in analogue studies.** *American Journal of Clinical Hypnosis*, 1971(Jan), Vol. 13(3), 171-174. In 2 studies, hypnosis was used to induce posthypnotically well-defined and measurable avoidance reactions. The influence of 2 therapeutic approaches on the avoidance reactions are compared.—*M. V. Kline.*

Drug Therapy

7016. **Albert, J. M., et al.** (Saint-Charles Hosp. Joliette, Quebec, Canada) **Effect of thiopropazine on 5-HIAA content in urine and cerebrospinal fluid of chronic schizophrenic patients.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 140-144.—The effect of thiopropazine on the 5-hydroxyindoleacetic acid (5-HIAA) content in urine and cerebrospinal fluid (CSF) of 26 chronic female schizophrenics has been studied and correlated with the symptoms of schizophrenia. After a 30-day withdrawal period, thiopropazine was introduced in a progressively increasing dose. The extrapyramidal and schizophrenic symptoms were graded according to the Buss Extrapyramidal Psychiatric Scale and Inpatient Multidimensional Psychiatric Scale (IMPS), respectively. 5-HIAA in urine and CSF was determined before and after the 15-day experiment. It was found that the level of 5-HIAA in urine is significantly decreased during thiopropazine therapy. A significant positive correlation between the severity of symptoms of schizophrenia and urine 5-HIAA was found. Ss with severe symptoms as measured by the IMPS, excrete more 5-HIAA in urine than Ss with mild symptoms. No correlation between the

content of 5-HIAA in urine and extrapyramidal symptoms was observed. The level of 5-HIAA in CSF showed a significant negative correlation with the level of 5-HIAA in urine at the beginning of the experiment. This correlation could not be found during the period of thioroperazine therapy. It is concluded that serotonin may contribute in the development of clinical symptoms of schizophrenia during active phases of the schizophrenic syndrome. Thus determination of 5-HIAA in urine and CSF may substantiate the clinical diagnosis. —*Journal summary.*

7017. Barcia, D., Martínez Carrillo, J. A., Morales, J. M., & Agüero, A. (U. Valencia, Spain) **Terapéutica psicofarmacológica de las neurosis: El problema de la personalidad y su influencia en los resultados terapéuticos.** [Psychopharmacological therapy of neurosis: The problem of personality and its influence on therapeutic results.] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1970(Jan), Vol. 29(1), 2-38.—Studied a random population of 50 neurotic patients treated with drugs in an attempt to determine the influence of an S's personality on the therapeutic outcome. By using the mathematical method of correlation coefficients and canonical correlations, the existing correlations between symptoms and diagnosis (subforms of neurosis, e.g., obsessive neurosis and anxiety) were analyzed. Results show that diagnosis was made according to the most predominant symptom. Personality was examined with the Rorschach test and a high correlation was found between Rorschach's "anxiety syndrome" and the diagnosis of neurosis. Basic Rorschach items were divided into class intervals and a statistical distribution similar to that of diagnosis was noted. Therapeutic results were studied in relation to the above mentioned factors, and the canonical analysis showed that treatments were established according to the main symptom and only minor tranquilizers were effective. 7 Rorschach profiles were found to be significantly correlated with the therapeutic outcome and a prognostic item scale was developed on this basis. (English summary)—*S. Maze*

7018. Blackwell, Barry & Sternberg, Martin S. (Cincinnati) **Trial management in psychopharmacology: The roles and tasks of an industry physician.** *Journal of Clinical Pharmacology & New Drugs*, 1971(Mar), Vol. 11(2), 83-90. This review of the role of an industry physician in trial management emphasizes those aspects relevant to psychopharmacology. There are many occasions during the evaluation of a new drug when the "common observation and common sense" approach can bring trials to a meaningful conclusion, as can the industry physician's role in organization.—*P. J. Federman.*

7019. Borenstein, P., Dumaine, A., & Cujo, Ph. (Villejuif Psychiatric Hosp., Paris, France) **Effets cliniques et biologiques du Décanoate de Fluphénazine: A propos de 35 observations.** [Clinical and biological effects of fluphenazine decanoate. 35 cases.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 267-273. Presents a report of experience using fluphenazine decanoate in the treatment of chronic psychoses. 35 hospitalized patients, with an average age of 30 and duration of illness of 5-10 yr., received 300-400 mg injections im every 2 wk. Most had received other psychotropic medications before. 6 were rated as symptomatic cures; 6 marked improvements; 9 partial or temporary improvements; 13 failures and 1 exacerbation. The overall impression was mitigated: the product

aided some patients not helped by other drugs but produced some difficulties, e.g., extrapyramidal secondary effects.—*H. King.*

7020. Butterworth, A. T. & Watts, Robert D. (East Louisiana State Hosp., Jackson) **Treatment of hospitalized alcoholics with doxepin and diazepam: A controlled study.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 78-81.—Compared the efficacy of doxepin with that of diazepam in treating anxious-depressive symptomatology in alcoholic Ss. Hospitalized 20 55 yr old Ss were selected who had no evidence of psychotic disorder, organic brain damage, or serious liver damage. Ss' degree of anxiety and depression was determined by psychiatric interview, scores on the modified Brief Psychiatric Rating Scale and Zung's Self-Rating Depression Scale. Ss were given 25 mg of doxepin or 5 mg of diazepam 3 times/day for 3 wk. Greater improvement was shown by the doxepin-treated Ss. Side effects were more prominent in the diazepam group, but both drugs were well tolerated.—*A. Farber.*

7022. Corey, Margaret J., et al. (Dalhousie U., Halifax, Nova Scotia, Canada) **Chromosome studies on patients (in vivo) and cells (in vitro) treated with lysergic acid diethylamide.** *New England Journal of Medicine*, 1970(Apr), Vol. 282(17), 939-943.—In a prospective study of 10 patients given LSD there was no difference in frequency of chromosome breakage between samples obtained immediately before and 24 hr after treatment. In 11 patients treated over periods ranging from 24 hr to 8 yr. before sampling the frequency of chromosomal breaks did not differ from that found in untreated controls. In an in vitro study the frequency of chromosomal breaks was increased in replicate cultures from each of 10 Ss when 1 μ g/ml of LSD was added during the last 24 hr of culture. There is no cytogenetic evidence that LSD given therapeutically produces chromosomal damage. The chromosomal aberrations found after illicit use of the drug remain unexplained.—*Journal abstract.*

7023. Council on Drugs, American Medical Association. **Evaluation of lithium carbonate for treatment of manic-depressive psychosis.** *JAMA: Journal of the American Medical Association*, 1971(Mar), Vol. 215(9), 1486-1488.—Discusses lithium carbonate as a useful drug in treating manic-depressive psychosis. However, it should be used cautiously. Adverse toxicity may occur at doses that are close to therapeutic levels. Adverse reactions, whether mild, moderate, or severe, are examined for type and cause. Pharmacology, as well as diagnosis and preparations of the drug are discussed.—*Journal abstract.*

7024. Council on Drugs, American Medical Association. **Evaluation of doxepin hydrochloride (Sinequan).** *JAMA: Journal of the American Medical Association*, 1971(Mar), Vol. 215(12), 1967-1969.—Discusses doxepin hydrochloride and its effect in the causes doxepine hydrochloride and its effect in the treatment of symptoms of depression with or without accompanying anxiety in patients with neurotic or psychotic disorders. The incidence and severity of its adverse reactions are similar to those of other tricyclic antidepressant drugs. Precautions to be observed in the administration, pharmacology, as well as dosage and preparations are discussed.—*Journal abstract.*

7025. **Darling, Harry F. Haloperidol in 60 criminal psychotics.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 31-34.—Reports that out of 30 chronically assaultive patients, 20 improved substantially on haloperidol after the phenothiazines had been tried and failed. Over a 5-mo period of observation, Ss were no longer assaultive, were substantially less psychotic, and engaged in some socialization or activity. 67% showed maximal to moderate improvement. 30 patients, also criminally psychotic, but not chronically assaultive, were studied for comparison. These Ss had also been treated unsuccessfully with the phenothiazines; 77% in this group showed marked to moderate improvement. Side effects were mainly extrapyramidal and were easily controlled. Haloperidol did not cause the weight gain, edema, and oversedation often caused by the phenothiazines. Although conclusions based on a noncontrolled study must be made with reservations, results indicate that haloperidol can be effective in violently psychotic patients even after phenothiazines have failed. —*Journal summary.*

7026. **Davis, John M. & Fann, William E.** (Vanderbilt U.) **Lithium.** *Annual Review of Pharmacology*, 1971, Vol. 11, 285-302.—Reviews research leading to the establishment of lithium as an efficacious drug in the treatment of depression. This article deals mainly with the pharmacology of this drug including such areas as alteration of cerebral biogenic amine function, lithium-induced hypothermia behavioral-EEG effects, excretion of the drug, effect on sodium and potassium metabolism, and clinical side effects. (148 ref.) —*F. Weinstein.*

7027. **Demers, Robert & Heninger, George.** (Yale U., Medical School) **Pretibial edema and sodium retention during lithium carbonate treatment.** *JAMA: Journal of the American Medical Association*, 1970(Dec), Vol. 214(10), 1845-1848.—Observed pretibial edema in 9 consecutive manic-depressive patients who were ingesting therapeutic amounts of lithium carbonate. The edema was slight to modest in amount, occurred during periods of high sodium intake, and was associated with sodium retention. In 4 cases it spontaneously disappeared, even though the high sodium intake and lithium carbonate treatment continued. The pathogenesis of the edema cannot be specified, since the measurements of renal, cardiovascular, and hepatic functions obtained during the period of edema were not abnormal. Although urinary excretion of aldosterone was not increased by treatment with lithium carbonate, spironolactone—a specific aldosterone inhibitor—temporarily eliminated the edema, indicating that the tubular reabsorption of sodium has some role in the edema formation. —*Journal abstract.*

7028. **Eisenberg, Leon.** (Massachusetts General Hosp., Boston) **Principles of drug therapy in child psychiatry with special reference to stimulant drugs.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 371-379.—Drugs, properly employed as a single component of a total treatment program, can be helpful in realizing the goal of healthy development of children. 4 problem areas are discussed: (a) the reluctance to test drugs on children; (b) long-term effects; (c) the issue of who is being treated; and (d) social cost. Principles for the use of stimulant drugs with children are proposed. (23 ref.) —*Journal abstract.*

7029. **Gunne, Lars-M; Lidvall, Hans F., & Widén, Lennart.** (U. Uppsala, Psychiatric Research Center, Sweden) **Preliminary clinical trial with L-DOPA in narcolepsy.** *Psychopharmacologia*, 1971, Vol. 19(2),

204-206. Describes the administration of L-dopa to 3 male and 3 female chronic narcoleptics to determine whether long-term administration had an alerting effect comparable to that of amphetamine. 4 Ss completed 35-112 days of treatment, the final dose varying from 1.2-2.4 gm. Psychological tests and EEGs could not confirm the favorable effects reported by 3 of the Ss who completed treatment. A high incidence of side effects discouraged the recommendation of L-dopa for long-term treatment and Ss returned to their previous therapy of amphetamine without change in tolerance. —*P. Hertzberg.*

7030. **Haertzen, Charles A.** (National Inst. of Mental Health, Addiction Research Center, Lexington, Ky.) **Subjective effects of narcotic antagonists cyclazocine and nalorphine on the Addiction Research Center Inventory (ARCI).** *Psychopharmacologia*, 1970, Vol. 18(4), 366-377.—Compared the subjective effects of 2 doses of cyclazocine (.6 and 1.2 mg/70 kg), nalorphine (16 and 32 mg/kg), no-drug, and placebo with 32 opiate addicts using drug sensitive scales of the Addiction Research Center Inventory (ARCI) items. The effects of these narcotic antagonists were highly similar on ARCI scales and items. Both drugs produced a general drug effect, difficulty in focusing eyes, physical weakness, tiredness, poor motivation, moodiness, misery, anxiety, tension, hallucinations, changes in sensation and perception, and inefficiency of physical, cognitive, and social functions. Cyclazocine was 15-26 times more potent than nalorphine. The effects of cyclazocine and nalorphine were differentiated from the effects of other drugs such as morphine, pentobarbital, and LSD when the overall pattern of effect was considered. (29 ref.) —*Journal abstract.*

7031. **Hollister, Leo E.** (Veterans Administration Hosp., Palo Alto, Calif.) **The pharmacologist: Clinical investigator dialogue in evaluation of new psychotherapeutic drugs.** *Journal of Clinical Pharmacology & New Drugs*, 1971(Mar), Vol. 11(2), 77-82.—The studies outlined are concerned with toxicologic matters. Each of 4 phases of evaluation of a new drug asks a different set of clinical questions. The main point is that if a continuing dialogue is established between the animal pharmacologist, drugs can be screened by both investigators with less investment in time and money. —*P. J. Federman.*

7032. **Kramer, Milton; Whitman, Roy M., Baldrige, Bill J., & Ornstein, Paul H.** (Veterans Administration Hosp., Cincinnati, O.) **Dream content in male schizophrenic patients.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 51-58.—Studied the manifest dream content of 11 male paranoid schizophrenics by monitoring each S for 6 nights, and a total of 260 awakenings in which the overall rate of dream recall was 71%. Dream content was transcribed, coded, and scored using the Hall van de Castle system. Dream recall was obtained in pre- and posttreatment conditions, the latter using psychotropic medication (chlorpromazine, trifluoperazine, perphenazine, or thioridazine). It was found that the percent of dream recall and REM episodes did not change with clinical improvement. Drug treatment also resulted in (a) the suppression of verbal productivity in describing dreams; (b) a decline in dreams marked by aggressive social interaction and several interactions; (c) a decline in strange, relative to familiar, dream characters; and (d) a decline in emotions in dreams. —*P. Hertzberg.*

7033. **Lewis, J. W., Bentley, K. W., & Cowan, A.**

(Reckitt & Colman Pharmaceutical Div., Hull, England) **Narcotic analgesics and antagonists.** *Annual Review of Pharmacology*, 1971, Vol. 11, 241-270.—Discusses the methodology employed in the screening of animals for physical dependence and psychological approaches to dependence and self-administration of opiates. Factors influencing relapse to opioids in the drug addict and recent theories of tolerance and dependence of the morphine type are reviewed. Heroin dependence at present is mostly treated with narcotic antagonists such as methadone, cyclazocine, and naloxone. Newer therapeutic agents under study include morphine derivatives, oripavines, benzomorphans, piperidines, pyrrolidines, and 2 new series of cyclohexane derivatives. (305 ref.)—F. Weinstein.

7034. Lippedge, M. S., Rees, W. Linford, & Pike, D. J. (St. Bartholomew's Hosp., London, England) **A double-blind comparison of dothiepin and amitriptyline for the treatment of depression with anxiety.** *Psychopharmacologia*, 1971, Vol. 19(2), 153-162.—50 16-73 yr. old outpatients took part in a double-blind controlled comparison of 2 antidepressants: dothiepin and amitriptyline. Each S's psychiatric state was assessed by both self-rating and clinician-rated scales. Ss were followed up for about 3 mo. Results of the trial show that dothiepin was superior to amitriptyline at the 5% significance level in terms of its antidepressant activity. Dothiepin was better tolerated in relation to its side effects than amitriptyline. For relief of anxiety symptoms both drugs appeared equally effective. (21 ref.)—*Journal abstract*.

7035. Lubetkin, Barry S., Rivers, P. Clayton, & Rosenberg, Chaim M. (State U. New York, Stony Brook) **Difficulties of disulfiram therapy with alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 168-171.—In spite of many patient contacts, publicity, and the offer of money as a reward, alcoholic patients at a state detoxication center did not wish to become involved in an outpatient disulfiram (antabuse) program. During 4½ mo., only 10 patients received the required 6 dosages and were discharged on disulfiram. It is suggested that disulfiram can be effective, although temporarily, in helping alcoholics cope with current crises without drinking impulsively. Recommendations to encourage participation in such programs are (a) inhospital educational orientation, and (b) a program coordinator responsible for offering the disulfiram program to each patient.—A. Farfaglia.

7036. Martin, A., Masson, J. M., & Bossard, J. C. **Effets de l'Acétyllinate d'Heptaminol sur les troubles cardio-vasculaires consécutifs aux traitements neuroleptiques.** [The effects of acetyllinate of heptaminol on cardiovascular problems following treatment by psychotropic drugs.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 275-277.—Cardiovascular complications that result from high and prolonged doses of the phenothiazines are well known. Of the corrective drugs that have been used against orthostatic hypotension and tachycardia, acetyllinate of heptaminol seems to be exceptional. A dosage of 3 gm/day used following therapeutic prescriptions of simple phenothiazines, e.g., chlorpromazine, was found most effective in the control of tensional problems that develop in the course of prolonged treatment with neuroleptic agents.—H. King.

7037. McLaughlin, Blaine E. (U. North Dakota) **Unexpected failure of a satisfactory anti-depressive drug routine to control hostile expression in psychiatric out-patients.** *Diseases of the Nervous System*,

1970(Nov), Vol. 31(11, Suppl.), 88-91.—Describes part of a 1968 test using 22 female and 5 male outpatients suffering from psychotic or psychoneurotic depressions who were treated with norpramine (an antidepressant) and various tranquilizers as adjunctive and antianxiety agents for a period of from 4-46 days. Results show that depression was markedly improved under medication, but no improvement in the Ss' expressed hostility as was expected. It is concluded that hostile expression has nothing to do with depression and that coaxing an S to express his hostilities outwardly is not a rational method of hoping for improvement.—P. Hertzberg.

7038. Melin, Bengt. (Kalmar Hosp., Sweden) **Observations on the use of Beclamide (nydrane) in a child psychiatric clinic.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 119-120. Discusses the treatment of 40 7-18 yr. old patients exhibiting aggressiveness, psychomotor anxiety with restlessness, and/or cerebral damage with beclamide (benzchlorpropamide). Improvement was noted in 53-57% of the Ss treated with beclamide alone or in combination with therapy. It is concluded that the drug is effective in treating these disorders. Dosage recommendations are presented.—*Journal summary*.

7039. Pichot, P. & Debray, H. R. **Contribution à l'emploi de l'analyse multifactorielle (multivariate analysis) dans les essais thérapeutiques.** [Contribution on the use of multivariate analysis in therapeutic trials.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 240-246.—Compares the action of sulferidazine and thioridazine on the same rated symptoms, e.g., anxiety, affective inhibition and aggressive, oppositional behavior occurring under several nosologic categories. By means of clinical tests with 142 psychotic subjects certain methodological problems often met in psychopharmacologic research and their solutions by the statistical techniques of multivariate analysis are illustrated. The action of neuroleptic agents is mainly to reduce symptoms, but their efficacy will vary depending on the context of symptom occurrence. Placebo effects and the influence of special experimental attention can be partialled out by double-blind methods. To evaluate the specific drug action on target symptoms, however, homogeneous syndrome groups must be formed and the symptomatic elements specified in each.—H. King.

7040. Rossman, M., et al. (Central Islip State Hosp., Research Div., N.Y.) **The anti-anxiety effects of haloperidol and trifluoperazine in an outpatient neurotic population.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 130-133. Examined the antianxiety effects of haloperidol and trifluoperazine in a sample of 57 20-72 yr. old neurotic outpatients. Medication was prescribed double blind to a maximum of 1.50 mg. of haloperidol and 2.75 mg. of trifluoperazine daily for an average duration of 30 days. The profiles of unwanted effects regarding type and frequency and the attrition rate was different for each treatment form. While both drugs appear to be effective, no clear statement of superior efficacy can be drawn from the present data.—*Journal summary*.

7041. Sizaret, P., Anglade, P., & Simon, J. P. **Recherche d'un renforcement pharmacodynamique des neuroleptiques par le 1.035 M. D.** [Research concerning dynamic reinforcement of neuroleptic drugs by 1.035 M. D. (sureptil).] *Encéphale*, 1970(May), Vol. 59(3), 278-288.—Enumerates side effects incurred by patients taking progressively larger doses of neuroleptics for chronic psychoses. It is suggested that side effects

may be eliminated with a decrease in neuroleptic drug dosage accompanied by conjoint administration of a neuroleptic-potentiating drug (i.e., a vasodilator). Results of the administration of sureptil (a vasodilator) are reported for a group of 35 hospitalized patients including chronic schizophrenics and character disorders. The following neuroleptics (50-500 mg/daily) were administered: (a) chlorpromazine (12 Ss), (b) levopromazine (17 Ss), and (c) thioridazine (6 Ss). In 8 cases, a 2nd neuroleptic (haloperidol, neuleptil, or dipiperon) was administered. A placebo was also administered during the 1st 15-21 days of the investigation. Following 15 days of therapy and the replacement of all psychotropic drug treatment by a placebo, 4 Ss experienced slight behavioral improvement, 9 Ss slight aggravation of symptoms, and 15 Ss no behavioral change. Following 21 days, dosages of neuroleptics were doubled in the 9 Ss who had experienced aggravation of symptoms. The remaining Ss were given combined treatment with neuroleptics and sureptil. In all cases, side effects produced by larger doses of neuroleptics were eliminated without diminishing the desired behavioral response. —P. R. Shibelski.

7042. Smith, Marshall E. A controlled comparative study of doxepin and chlorthalidoxepoxide in psychoneurotic anxiety. *Journal of Pharmacology & New Drugs*, 1971(Mar), Vol. 11(2), 152-156.—In a double line study the antianxiety activity of doxepin was compared with that of chlorthalidoxepoxide in 2 homogeneous groups of psychoneurotic patients with target symptoms of anxiety/tension. The therapeutic effect of doxepin appeared earlier and resulted in a greater overall improvement than chlorthalidoxepoxide. Statistical analyses of the Hamilton Anxiety Scale showed that both drugs produced a significant improvement in symptoms of anxiety. Doxepin and chlorthalidoxepoxide were equally effective in their effect on both the general factor of anxiety and the bipolar factor representing somatization. Both drugs were tolerated and all side effects seen were mild in intensity. —P. J. Federman.

7043. van Praag, H. M. & Korf, J. (State U. of Groningen, Psychiatric Clinic, Netherlands) Endogenous depressions with and without disturbances in the 5-hydroxytryptamine metabolism: A biochemical classification? *Psychopharmacologia*, 1971, Vol. 19(2), 148-152. Studied the influence of iv administered probenecid on the 5-hydroxyindole-acetic acid (5-HIAA) concentration in the cerebrospinal fluid (CSF) in 15 Ss with vital (endogenous) depression and 15 nondepressive controls. The average increase of the 5-HIAA concentration in the CSF after probenecid administration was smaller in the depressive than in the control group. Moreover, the depressive group included Ss with a normal as well as Ss with a subnormal probenecid effect. This could mean, that the group of vital depressions encompasses 2 biochemically different categories: Ss with and Ss without demonstrable disturbances in the metabolism of 5-hydroxytryptamine in the brain. (20 ref.)—*Journal abstract*.

7044. van Praag, H. M. & Korf, J. (State U. of Groningen, Psychiatric Clinic, Netherlands) Retarded depression and the dopamine metabolism. *Psychopharmacologia*, 1971, Vol. 19(2), 199-203.—Demonstrated that the influence of iv administered probenecid on homovanillic acid concentration in cerebrospinal fluid was less pronounced in a group of 8 retarded depressive

Ss than in a group of 12 nonretarded depressives and 12 nondepressive controls. The figures corresponded to that found in Parkinson patients. Findings suggest a decreased consumption of dopamine in the brain in retarded depression. This might be understood as an indication that, disorders of cerebral dopamine metabolism are related not so much to a specific nosological entity as to a given motor status, possibly that of hypokinesia.—*Journal abstract*.

7045. van Praag, H. M., Korf, J., & van Woudenberg, F. (State U., Central Isotope Lab., Groningen, Netherlands) Investigation into the possible influence of chlorinated amphetamine derivatives on 5-hydroxytryptamine synthesis in man. *Psychopharmacologia*, 1970, Vol. 18(4), 412-420.—In test animals, 4-chloro-N-methylamphetamine (CMA) and 4-chloroamphetamine (4-CA) cause a decrease in the cerebral 4-chloroamphetamine (4-CA) cause a decrease in the cerebral 5-hydroxytryptamine (5-HT) and 5-hydroxyindoleacetic acid (5-HIAA) concentrations; they exert no appreciable influence on catecholamine concentrations. In 15 depressive patients, these compounds had a therapeutic effect on depression. In terms of antidepressant effect, they resembled not so much the nonchlorinated amphetamine derivatives as the true antidepressants. The question of whether the influence of CMA and 4-CA on the 5-HT metabolism is based on inhibition of 5-HT synthesis is considered. No arguments to support this hypothesis were found; findings obtained did support the postulate that these compounds are 5-HT depleters. A possible explanation of the antidepressant effect of chlorinated amphetamine derivatives is offered (33 ref.)—*Journal abstract*.

HOSPITAL CARE & INSTITUTIONALIZATION

7046. Adler, M., Burkhardt, H. P., & Dirlich, G. (Steghitz Clinic, Neurosurgery Div., Berlin, W. Germany) Über die Tischordnung beim Essen auf einer offenen, gemischten, psychiatrischen Station: Eine orientierende Studie und Überlegungen zu einem Modell. [Concerning the seating arrangements during meals in an open, mixed psychiatric ward: An oriented study and foundation for a model.] *Social Psychiatry*, 1971(Jan), Vol. 6(1), 46-51. Observed the seating arrangement at meals of an open-door, mixed, psychiatric ward. Clusters of seating arrangement correlated with the variables, agreeable-nonagreeable, and with the degree of illness. A statistical model for such social-psychological questions is proposed which questions the correlations mentioned. The number of different social constellations is described as growing many times faster than the number of test persons. The seating arrangement skewed the data so that the cumulative scores were distorted in terms of social relations, and was influenced by the sequence of entering the dining room. It is concluded that multivariable analyses of such a complex problem cannot produce a testable hypothesis and that only single-variable analyses are appropriate strategies for this type of research. (French summary)—*English abstract*.

7047. Almond, Richard. (Stanford U., Medical School) The therapeutic community. *Scientific American*, 1971(Mar), Vol. 224(3), 34-42.—In this new approach to treating mental disturbance, the hospital

great deal of insight into the interpersonal interaction for both the investigators and the participants. S. M. Halpin.

7059. Nigro, Samuel A. (Case Western Reserve U., Medical School) **A psychiatrist's experiences in general practice in a hospital emergency room.** *JAMA: Journal of the American Medical Association*, 1970(Nov), Vol. 214(9), 1657-1660. Emphasizes the need for psychologically sound techniques in managing emergency-room patients because of the frequency of psychological problems. A psychiatrist related his reaction upon returning to part-time general practice in a suburban general hospital emergency room and managing 469 patients in 5 mo. Patients were assigned 1 of 9 categories as indicators of the degree of psychological attention needed. More than $\frac{1}{2}$ of the sample had "pure" medical-surgical problems. More than $\frac{1}{4}$ had problems primarily of psychological origin. Less than 12% were physically sick enough for admission; psychiatric help was recommended for 8%. The need for psychological attention was generally evident, either with the patients or relatives or both. The frequency of psychological problems indicates that medical facilities are in a psychosocial epidemic. The psychiatrist felt his perception of and way of dealing with patients was markedly affected by his specialty training in comparison to his prepsychiatry practice.—*Journal abstract*.

7060. Quilelli Corrêa, Roberto A., et al. (Federal U. of Rio de Janeiro, Medical School, Brazil) **Uma Experiência de comunidade terapêutica.** [An experience with a therapeutic community.] *Arquivos Brasileiros de Psicologia Aplicada*, 1970(Jun), Vol. 22(2), 69-83. - Presents tests from speeches by employees from the Pinel Hospital, Rio de Janeiro, Brazil, which were included in the 9th Congress of Neurology, Psychiatry, and Mental Health. Different theories on the ideal aims and goals of a therapeutic community are discussed, stressing individual attention and the benefits to be derived from the individual acting within a group setting. The therapeutic experience at the hospital is also considered with regard to its successes and shortcomings. —P. Hertzberg.

7061. Rowe, Daniel S., et al. (Yale U., Medical School) **A hospital program for the detection and registration of abused and neglected children.** *New England Journal of Medicine*, 1970(Apr), Vol. 282(17), 950-952.—Describes a program developed to facilitate early identification of abused and neglected children that includes a registry of such patients and a committee of staff members who are particularly qualified to deal with such problems. During the 18 mo. since the inception of the registry, 118 patients have been listed in the registry: 37 have evidence of abuse, 69 of neglect, and 12 are thought to be at high risk of maltreatment. The program appears to have increased the level of staff awareness of these problems, promoted early identification and led to thorough investigation, active intervention, and follow-up observation. A report to the Committee does not replace the mandatory formal report to the State Health or Welfare Department, and the Committee's tasks include assistance to the house officer in fulfillment of this responsibility.—*Journal abstract*.

7062. Walker, Robert & Ascí, Marguerite. (Veterans Administration Hosp., Brockton, Mass.) **Evaluation of an experimental rehabilitation ward for chronic mental patients.** *Rehabilitation Literature*, 1971(Feb), Vol. 32(2), 40-41, 50.—To examine the effect of a nontraditional ward atmosphere in a Veterans Admin-

istration Hospital caring for chronically ill patients. 30 Ss were exposed to employment opportunities in a sheltered situation, with emphasis on paid-daytime work. Comparisons were made of the adjustment of these Ss prior to and subsequent to their exposure to this program. The results show measurably higher social adjustment. Although the degree of living independence was not significant, the level of employment rose from virtually total unemployment to 13% of full employment restoration over the 3 yr. of the follow-up.—S. L. Warren.

7063. Zaenglein, Mary M. (U. Notre Dame) **A study of communications, status, and perceptions in mental hospital organizations.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4891.

PSYCHOANALYTIC INTERPRETATION

7064. Derbolowsky, U. (35 Papenhuder Str., Hamburg, W. Germany) **Drei-Stufen-Technik der Traumdeutung innerhalb psychoanalytischer Verfahren.** [Three-stage technique of dream interpretation in a psychoanalytic management.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Nov), Vol. 20(6), 247-256.—Describes a 3-stage technique of dream interpretation. In the 1st stage the dream is expressed by the patient. In the 2nd stage its complementary inversion as immediate distress of the patient is worked out by the therapist. In the 3rd stage dream content is worked out. This technique is seen to offer optimum integration in a non-iatrogenic-directive method. In group analysis every impulse can be worked out and reviewed by means of free group interactions. (36 ref.)—*English summary*.

7065. Lowenfeld, Henry & Lowenfeld, Yela. (350 Central Park West, New York, N.Y.) **Die permissive Gesellschaft und das Überich: Freuds Gedanken zur Kulturentwicklung, vom Standpunkt der Gegenwart betrachtet.** [The permissive society and the superego: Freud's thoughts concerning the development of civilization from the standpoint of present considerations.] *Psyche, Stuttgart*, 1970(Sep), Vol. 24(9), 706-720.—Discusses Freud's ideas about the development of civilization and its dilemma between freedom and restriction of drives, derived from his study of the conflict in neurosis, which have been remarkably confirmed by the events and the change of the cultural climate of the last 50 yr. Sexual freedom has considerably transformed the manifestations of the neuroses; however, it has not produced greater mental health but only new neurotic constellations. The lesser repression of infantile sexuality has reduced the control of aggression. However, the hostility against culture which forces the individual to restrict his libidinal and aggressive drives has increased. In a period of cultural stability, the infantile, irrational demands of the superego which conflicted with the mature superego could be worked out in the analytic process. The protecting and controlling function of the superego could be left to the influence of the surrounding society. However, it is concluded that the present societal structure confronts psychoanalysis with entirely new tasks.—*English summary*.

7066. Rasper, H. O. (13 Josef Schraffl Str., Innsbruck, Austria) **Kriminalität und Perversion als Manifestation von Über-Ich-Isolierung und Liebesunfähigkeit: Untersuchung der Selbstbekenntnisse im Prosawerk Jean Genets.** [Criminality and perversion as manifestations of super-ego isolation and inability to love:

Investigation of self-confessions in the prose of Jean Genet.] *Zeitschrift für Psychotherapie und medizinische Psychologie*, 1970(Nov), Vol. 20(6), 223-235.—Examined the largely confessional prose of Jean Genet, particularly, *The Diary of a Thief*. An attempt is made to isolate indications of early childhood trauma. Perversion and crime were 2 of the main themes in Genet's literary works. Illustrative material is presented to substantiate the claim that Genet never solved his Oedipal conflict. It is suggested that Genet used his writing as a therapeutic modality in attempting to effect a catharsis for his asocial behavior. (English summary)—*B. A. Stanton*.

7067. Sarwer-Foner, G. J. (Queen Elizabeth Hosp., Montreal, Quebec, Canada) **Human territoriality and its catexis. Diseases of the Nervous System**, 1970(Nov), Vol. 31(11, Suppl.), 82-87.—Theorized that territoriality is present in man as well as lower animals, noting the differences between ethological concepts of instincts and the psychoanalytic ones that are applied to humans. Human territoriality involves cathecting geographic space and symbolized personal space. "including man's intrapsychic visualizations of his intellectual interest, activities, and social sign posts of positioning in relationship to his fellows...." It is believed that this symbolized form of human territoriality enhances psychoanalytic knowledge of instincts. (69 ref.)—*P. Herizberg*.

PSYCHODIAGNOSIS

7068. Ables, Billie S. (U. Kentucky, Medical School) **The use of the Draw-A-Man Test with borderline retarded children without pronounced pathology. Journal of Clinical Psychology**, 1971(Apr), Vol. 27(2), 262-263.—Emotional or organic problems in children contributed to an underestimation of intellectual functioning when using the Draw-A-Man Test (DAM). With children of borderline intellectual functioning, who demonstrate no evidence of emotional or organic problems, the DAM closely approximated the Stanford-Binet or WISC results. Results suggest the usefulness of the DAM as a brief screening device for children with borderline intelligence.—*E. J. Kronenberger*.

7069. Barker, Harry R., Fowler, Raymond D., & Peterson, Lars P. (U. Alabama) **Factor analytic structure of the short form MMPI items in a VA hospital population. Journal of Clinical Psychology**, 1971(Apr), Vol. 27(2), 228-233.—9 factors were retained from a factor analysis of the short form MMPI on 1,575 hospital Ss. A computer operating system (MATLAN) was used. An explanation of each factor is presented. Results support traditional research and code typing, and the unitary nature of certain subtest items. An alternate scoring scheme is suggested as is further empirical research.—*E. J. Kronenberger*.

7070. Berger, Josip & Mladinovic, Vera. (Neuropsychiatric Clinic, Belgrade, Yugoslavia) **Dijagnostički stereotipi kliničkih psihologa i psihijatara. [Diagnostic stereotypes of clinical psychologists and psychiatrists.] Revija za Psihologiju**, 1970, Vol. 1(1), 5-9.—Investigated the similarities and differences of the "typical case" for 4 nosological categories in clinical practice (psychoneurosis, schizoid personality, adolescent crisis, and border case) by Q-sort (70 items). 7 clinical psychologists and 8 psychiatrists described the "typical case." Homogeneity of the descriptions revealed substantial differences within individual descriptions in

both groups of judges. Homogeneity indices were higher in the psychologist group, but the difference (except for adolescent crisis) was not significant. Significant differences in homogeneity of descriptions of different categories were found in both groups. Correlations of diagnostical stereotypes between psychologists and psychiatrists ranged from .02 to .78. Large variations of correlation coefficients were found in all categories. Since the coefficients of homogeneity in this study were higher than in validation studies of individual clinical information, 3 different explanations are possible: (a) the Q-sort technique is biased in favor of stereotyped descriptions, (b) usual criteria for validation of clinical descriptions are inadequate, and (c) clinicians are incapable of rationally integrating accumulated information. (English abstract) (16 ref.)—*A. Fulgosi*.

7071. Bersoff, Donald N. & Grieger, Russell M. (Ohio State U.) **An interview model for the psychosituational assessment of children's behavior. American Journal of Orthopsychiatry**, 1971(Apr), Vol. 41(3), 483-493.—Presents an interview strategy with primary focus on behavior analysis and the concomitant uncovering of antecedent and consequent conditions that elicit, reinforce, and perpetuate that behavior. Its goal is to acquire relevant information that will contribute to decisions about desired changes in behavior.—*Journal abstract*.

7072. Cleobury, J. F., Skinner, G. R., Thouless, M. E., & Wildy, P. (St. Augustine's Hosp., Canterbury, England) **Association between psychopathic disorder and serum antibody to herpes simplex virus (Type 1). British Medical Journal**, 1971(Feb), Vol. 1(5746), 438-439.—Examined the sera of a small series of patients for herpes simplex virus antibody. 3 clinically-defined groups of patients were compared: (a) 13 aggressive psychopaths, (b) 14 psychiatric controls, and (c) 13 general hospital patients. The 1st group had an unusually high average kinetic neutralization constant against Type 1 herpes simplex virus.—*Journal summary*.

7073. De Wolfe, Alan S. (Veterans Administration Hosp., Downey, Ill.) **Differentiation of schizophrenia and brain damage with the WAIS. Journal of Clinical Psychology**, 1971(Apr), Vol. 27(2), 209-211. Studied WAIS subtest patterns in schizophrenic and non-lateralized brain-damaged patients. 3 criteria involving Digit Span, Comprehension, and Vocabulary were formulated. These criteria were cross-validated. Results support the hypothesis that chronic schizophrenic and nonlateralized brain-damaged patients can be distinguished by their WAIS subtest performance. *E. J. Kronenberger*.

7074. Fowler, Raymond D. & Athey, Elizabeth B. (U. Alabama) **A cross-validation of Gilberstadt and Duker's 1-2-3-4 profile type. Journal of Clinical Psychology**, 1971(Apr), Vol. 27(2), 238-240.—25 hospital patients, whose MMPI profiles met the rules for Gilberstadt and Duker's 1-2-3-4 profile type, were rated by 3 judges on a checklist of complaints, traits, and by symptoms. In general, the results of this study support to some degree the actuarial system of Gilberstadt and Duker. There was, however, little agreement with respect to diagnostic labels.—*E. J. Kronenberger*.

7076. Gonzales, M. Garcia-Pardo. **Sobre el problema de la paranoia alcoholica. [On the problem**

personality characteristics of hospitalized narcotic addicts on the MMPI. *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 174-181.—4 groups of male addicts were administered the Lexington Personality Inventory which is composed of MMPI items and other true-false statements describing personal traits, social attitudes, and subcultural role descriptions that differentiate individuals. A multiple discriminant analysis of the MMPI and other psychometric data were accomplished. Patients were more egocentric, defensive, sexually confused, and socially maladaptive. Profile difference contrasted voluntarily and involuntarily hospitalized patients. The total sample approximated the 4-2-8 actuarial code which is different from prior studies indicating the 4-9 or 9-4 profile.—*E. J. Kronenberger.*

7087. **Citron, B. Philip, et al.** (U. Southern California, Medical School) **Necrotizing angitis associated with drug abuse.** *New England Journal of Medicine*, 1970(Nov), Vol. 283(19), 1003-1011.—Studied 14 young drug abusers with a necrotizing angitis indistinguishable from periaortitis nodosa. The 6 women and 8 men had used narcotics, stimulants, hallucinogens, and depressants. Methamphetamine, alone or in combination with heroin or LSD, was used commonly. The clinical presentation varied from a complete lack of symptoms in 5 patients to pleomorphic systemic signs and symptoms with renal failure, hypertension, pulmonary edema, and pancreatitis. The vascular changes of necrotizing angitis, including arterial aneurysms and sacculations, were noted in the kidney, liver, pancreas, and small bowel at selective angiography. Postmortem findings in 4 patients revealed generalized vascular changes of differing age, including chronic and healed lesions. Because of the multiplicity of injected substances with the high probability of contaminations the exact etiologic agent in these cases is not clear; however, methamphetamine appears to be a common denominator.—*Journal abstract.*

7089. **Hendricks, William J.** (California Rehabilitation Center, Corona, Calif.) **Use of multifamily counseling groups in treatment of male narcotic addicts.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 84-90.—Random sampling of approximately 1/3 of the male residents who participated in multifamily counseling groups indicates that those who had this experience made a more acceptable adjustment in outpatient status than did male outpatients who were not exposed to this treatment intervention. 1 yr. after release, 41% of the sample remained in outpatient status. This compares favorably with the 1-yr follow-up rate of 21% for all male outpatients. The selective factors involved in both residents and family members volunteering to participate in multifamily counseling groups and their probable higher motivation to overcome the addiction process are to be noted.—*Journal summary.*

Alcoholism

7090. **Ando, Haruhiko & Hasegawa, Etsuko.** (Gifu, Prefectural Hosp., Neuropsychiatric Clinic, Tajimi, Japan) **Drinking patterns and attitudes of alcoholics and nonalcoholics in Japan.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 153-

161.—Conducted an investigation in Tajimi, Japan between May 1964 and September 1967, using 133 alcoholic and 150 nonalcoholic Japanese men. Early drinking behavior is described in terms of age of 1st drink, who offered the 1st drink, occasion of 1st drink, and beginning of heavy drinking. Present drinking is described in terms of incidence or occasion, principal drinking place, beverage preference, foods eaten with the beverage, average quantity, maximum quantity, mood when intoxicated, and taste of beverages. Attitudes toward drinking are discussed in relation to self-estimate of drinking, attitude toward alcoholics, family attitudes, and effects of drinking.—*S. R. Diamond.*

7091. **Cohen, Miriam; Liebson, Ira A.; Failace, Louis A., & Speers, Wendell.** (Baltimore City Hosp., Md.) **Alcoholism: Controlled drinking and incentives for abstinence.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 575-580.—Reports a demonstration of abstinence and controlled drinking in 4 white, male alcoholics which indicates that excessive drinking can be moderated by reinforcement contingencies. Ss could earn money each time that they abstained or stopped drinking after a priming dose for 1 day. The magnitude of reinforcement required for maintaining abstinence or moderation was a function of the priming dose of alcohol and the delay of reinforcement. Results suggest that controlled drinking may be maintained if the reinforcers dispensed to the alcoholic are made contingent on moderate drinking.—*Journal abstract.*

7092. **Dichter, Marvin; Driscoll, Geneva Z., Ottenberg, Donald J., & Rosen, Alvin.** (Eagleville Hosp. & Rehabilitation Center, Pa.) **Marathon therapy with alcoholics.** *Quarterly Journal on Alcohol*, 1971(Mar), Vol. 32(1-A), 66-77.—Studied marathon therapy with alcoholics in an inpatient treatment community directed by an interdisciplinary staff. 10 marathons were conducted with 8-10 patients and 3-5 therapists. The 1st 100 alcoholics who participated were compared to 137 who did not receive marathon therapy. A 57% improvement was found at follow-up (4-18 mo. later) when 83 of the marathon Ss were contacted, as compared to 53% improvement for nonmarathon Ss, with 120 contacted. Principal limitations and cautions are discussed with respect to the participants, the marathon itself, the therapists or leaders, and the environmental setting. *A. Farfuglia.*

7093. **Dunn, James H. & Clay, Margaret L.** (U. Michigan, Mental Health Research Inst.) **Physicians look at a general hospital alcoholism service.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 162-167.—Almost 1/2 of the physicians who responded to a questionnaire concerning a general hospital alcoholism service referred patients to the program and reported favorable attitudes toward it. Complaints about the program were minimal. Better long-term treatment and a larger outpatient recovery program were the most important improvements suggested. It is concluded that alcoholic rehabilitation can function effectively in a general hospital without interrupting the hospital environment.—*A. Farfuglia.*

7094. **Garlie, Norman W.** (U. Utah) **Characteristics of teenagers with alcohol related problems.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4544.

7095. **Goldstein, Gerald & Shelly, Carolyn H.** (Veterans Administration Hosp., Topeka, Kan.) **Field dependence and cognitive, perceptual and motor skills**

in alcoholics: A factor analytic study. *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 29-40. -Studied the presence of field dependence in alcoholics to other aspects of cognitive functioning by factor analysis. Field dependence was measured with the Witkin Rod and Frame Test (RFT), while subtests of the Halstead Neuropsychological Battery and the WAIS were used to evaluate aspects of cognitive functioning. The strategy employed was to determine how RFT performance fits into the factor structure of these other tests. 50 male alcoholics, mean age 45, with no organic brain syndrome, were tested. Results indicate that more Ss had mild intellectual impairment than would be found in a comparable group of nonalcoholics. However, their tendency to be field dependent cannot be easily related to this mental deficit. Ss showed normal language function, and normal elementary perceptual and motor abilities, but impaired ability on tasks involving motor speed and manual dexterity. (16 ref.) *A. Farfaglia.*

7096. **Gozali, Joav & Sloan, Jack.** (U. Wisconsin, School of Education, Milwaukee) **Control orientation as a personality dimension among alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 159-161. -Compared 55 alcoholics and 98 nonalcoholics, using Rotter's Internal-External Control Scale as a measure. Internal control refers to the perception of positive and/or negative events as being a consequence of one's own actions and under personal control; external control refers to the perception of positive and/or negative events as being unrelated to one's own behaviors and beyond personal control. Results indicate that alcoholic Ss were significantly more internally oriented, perhaps accounting for their belief that they could control their drinking. A 2nd study with 101 alcoholics (given the MMPI in addition to Rotter's Scale) is described. It is concluded that although internally oriented persons are considered "healthier," internal orientation "may contribute to a person's proclivity to become an addict." It is suggested that alcoholism treatment programs should consider modification of the alcoholic's control orientation. —*A. Farfaglia.*

7097. **Gross, William F. & Carpenter, Linda L.** (Veterans Administration Hosp., Lexington, Ky.) **Alcoholic personality: Reality or fiction?** *Psychological Reports*, 1971(Apr), Vol. 28(2), 375-378. -Administered the 16 PF to 266 male alcoholics when they voluntarily entered a 60-day treatment program at a Veterans Administration hospital. Ss scored significantly higher than the standardization group on 6 scales and significantly lower on 6 other scales. Data support the view that chronic alcoholics are a distinct personality type. —*Journal abstract.*

7098. **Hardy, Richard E. & Cull, John G.** (Virginia Commonwealth U., Richmond) **Vocational satisfaction among alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 180-182. -Studied the differences between the expressed vocational interests (Kuder Vocational Preferences) of alcoholics and their actual occupations prior to admission to a state vocational rehabilitation and treatment center. Ss were 93 alcoholics and 72 nonalcoholics. Both groups showed a preference for social service and clerical rather than mechanical occupations. Alcoholic Ss had fewer such jobs and, from performance on verbal intelligence tests, were less suitable for them. The strong preference for social service work may be explained in part by the fact

that Ss were being assisted by social service workers. —*A. Farfaglia.*

7099. **Hudson, Richard M. & Rhodes, Robert J.** (Pioneer Fellowship House, Seattle, Wash.) **A follow-up study of tuberculous skid row alcoholics: II. Hospital and posthospital attitudes and care.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 116-122. -Studied the behavior and feelings of tuberculous skid row alcoholics toward a sanitarium and its staff. 15 Ss were interviewed approximately 9 mo. after discharge, and were asked to tell how their tuberculosis was discovered, whether hospitalization had helped them, and their attitudes toward the staff. 5 Ss discovered their tuberculosis as a result of X-rays taken on admission to jail, and 3, after participating in a mobile X-ray. 12 Ss felt that hospitalization had helped them. The favorable feeling toward the staff was the most significant experience in interpersonal relationships. 13 Ss felt that some type of transitional halfway house would benefit the tuberculous alcoholic. 13 Ss received posthospital treatment at a health clinic. Although most had drunk while hospitalized, Ss indicated that they would have welcomed treatment for their alcoholism. —*A. Farfaglia.*

7100. **Kearney, Michael.** (U. California, Riverside) **Drunkenness and religious conversion in a Mexican village.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 132-152. —"As in much, if not most, of rural Mexico, drunkenness is endemic in the Zapotec-mestizo town of Istepeji, Oaxaca. In Istepeji drunkenness frequently results in a specific syndrome of alcoholism, developing in middle-aged men, which involves extreme personality and behavioral changes ... [The] epidemiology and symptomatology of this syndrome, related folk beliefs and practices, and role of religious conversion as a means of escape from institutionalized social patterns compelling reluctant individuals to drink" are discussed. It is suggested that "the main motivation to drink was to intensify emotional experience as a means of momentarily transcending a negatively perceived social and geographic environment." —*S. R. Diamond.*

7101. **Keehn, J. D.** (York U., Toronto, Ontario, Canada) **Reinforcement of alcoholism: Schedule control of solitary drinking.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 28-39. —Analyzes alcoholism in the light of the stimulus-response-reinforcement paradigm which stresses the positive and social consequences of drinking. This analysis must be subtly applied to solitary drinking. Alcohol has the important property of facilitating social interaction. Extraschedule effects are discussed. How "social transactions could function both to generate and maintain solitary drinking [are discussed] by reference to the phenomena of reinforcement schedules, discriminative functions of punishment, multiple-schedule control, and behavioral byproducts of intermittent reinforcement." (19 ref.) *S. R. Diamond.*

7102. **Kish, George B.** (Roanoke Coll.) **CPI correlates of stimulus-seeking in male alcoholics.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 251-253. —100 hospitalized male alcoholics were administered the CPI and the Sensation-Seeking Scale (SSS). The findings suggest that stimulus seekers were more comfortable, poised, and dominant in social situations; less well socialized; more immature, irresponsible, independent, and nonconforming; more intelligent, flexible, adaptable, and changeable in temperament; and more

masculine in their interest patterns than nonstimulus seekers. A cautionary note with regard to the interpretation of these findings is presented.—E. J. Kronenberg.

7103. Lucero, Rubel J., Jensen, Karl F., & Ramsey, Catherine. (Hazelden Rehabilitation Center, Center City, Minn.) **Alcoholism and teetotalism in blood relatives of abstaining alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar). Vol. 32(1-A), 183-185. Studied the relationship between teetotalism and alcoholism. 40 abstaining 26-70 yr. old alcoholics served as Ss. Periods of sobriety varied from 6 mo. to 20 yrs. 119 grandparents, 356 parents, aunts, and uncles, and 165 siblings of the Ss were identified. Alcoholism and teetotalism were found in an inverse relationship. It was found that if a member of a family was an alcoholic, 82% of the time there was at least 1 other alcoholic in the family. Clustering of alcoholism in some families, although from a very restricted sample, was apparent from the data. "If social learning is the only factor in teetotalism and alcoholism it might be predicted that a decrease in teetotalism would be associated with a decrease in alcoholism. . . ."—A. Farfaglia.

7104. Majchrowicz, Edward & Mendelson, Jack H. (St. Elizabeths Hosp., Washington, D.C.) **Blood concentrations of acetaldehyde and ethanol in chronic alcoholics.** *Science*, 1970(May). Vol. 168(3935), 1100-1102.—Studied 15 adult male alcoholic volunteers before, during, and after a 10-15 day period of experimentally induced intoxication. Blood acetaldehyde concentrations ranged from .11-.15 and from .04-.08 mg/100 ml when blood ethanol concentrations ranged from 1-400 mg/100 ml after consumption of bourbon or grain ethanol, respectively. No dose or dose-time relationships were found between blood ethanol concentrations and blood acetaldehyde concentrations during any phase of the study. *Journal abstract.*

7105. McCusker, Jane; Cherubin, Charles E., & Zimberg, Sheldon. (Harlem Hosp. Center, New York, N.Y.) **Prevalence of alcoholism in general municipal hospital population.** *New York State Journal of Medicine*, 1971(Apr). Vol. 71(7), 751-754.—Investigated the extent of alcoholism at Harlem Hospital. 151 patients admitted to 2 male and 2 female medical wards during a 3-wk period were studied. 33 Ss were incapable of being interviewed. The remaining 118 supplied the data for investigation. The diagnosis of alcoholism was made on the basis of the Alcohol Abuse Scale developed by S. Zimberg. The prevalence rate of alcoholism was determined by age and sex. Total prevalence was 47%: 60% of the males and 34% of the females. The house staff diagnosed only 50% of the Ss as alcoholics, however, they made only 1 false positive diagnosis.—*Journal summary.*

7106. Miller, Byron A., Pokorny, Alex D., Valles, Jorge, & Cleveland, Sidney E. (Veterans Administration Hosp., Houston, Tex.) **Biased sampling in alcoholism treatment research.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar). Vol. 31(1-A), 97-107.—Identifies and describes a series of sources of sampling bias, and illustrates the effects of these sources with findings from an alcoholism treatment project. The 12 types of case losses in alcoholism treatment research are (a) varying definitions of alcoholism, (b) case selection from special populations, (c) reputation of the treatment program, (d) refusal of referral, (e) rejection of applicants, (f) failure to report after acceptance into a treatment program, (g)

exclusion from study protocol, (h) drop-outs during treatment, (i) living or moving beyond feasible follow-up distance, (j) deaths, (k) inability to trace cases, (l) refusal to participate in follow-up interviews. A representative group of published studies, considered in terms of biased sampling, is critically examined. (42 ref.)—S. R. Diamond.

7107. Morin, J. Y. & Courtois, Paul. **Alcoolisme, maladie sociale.** [Alcoholism, social malady.] *Annales Médico-Psychologiques*, 1970(Jul). Vol. 2(2), 221-235.—After considering several definitions of the term social illness—whether a problem of the social body itself, or something transmitted from the individual to society or from society to the individual—the problem of alcoholism is discussed from the historical and cultural viewpoint. The hypothesis is offered that alcoholism is the result of the strong value that society places on production and consumption to the neglect of instinctual satisfaction. Alcohol itself is considered the symbol of the ultimate in consumption, disappearing completely as a commodity once consumed and signifying "merchandised pleasure" to a society already rigidly centered on work, production, and efficiency.—H. King.

7108. Rathod, N. H. & Thomson, I. G. (St. Christopher's Day Hosp., Horsham, England) **Women alcoholics.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar). Vol. 32(1-A), 45-52.—Compared 30 alcoholic women, married at least once and whose drinking was associated with repeated psychosocial dysfunctioning for at least 5 yr., to 30 alcoholic men matched for age, duration of marriage, educational attainment, and social class. 4 areas of Ss' history were tested: (a) family history, (b) adverse experiences in early life, (c) adult interpersonal relationship of S and spouse, and (d) previous psychiatric illness. Data were collected from the Ss, their spouses and children, and previous medical records. Group psychotherapy and Ss' written life story were added sources of information. Results confirm the impression of B. Rosenbaum that (a) women alcoholics have experienced more deprivation than men alcoholics by having lost a parent in childhood, (b) as children, the women have been subjected to significantly more emotional traumas, and (c) as adult personalities, they emerge more maladjusted than men. (21 ref.)—A. Farfaglia.

7109. Rosenblatt, S. M., et al. **Patients admitted for treatment of alcohol withdrawal syndromes: An epidemiological study.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar). Vol. 32(1-A), 104-115.—Studied the relationship between the incidence of the alcohol withdrawal syndrome and the social characteristics of the neighborhoods from which the patients come. The addresses of 567 men admitted for treatment of alcohol withdrawal syndromes were plotted. Information from 1960 census data for Brooklyn, New York established the racial distribution, degree of overcrowding of the housing units, median annual income, median education, percentage of unemployed, and number of households that have remained in the tract since 1955. Ss tended to come from overcrowded areas of low income, educational level, and residential stability. The rates for venereal disease, juvenile delinquency, tuberculosis, and homicide were high. The same socioeconomic factors which create unstable communities are also related to admissions for alcoholic psychoses.—A. Farfaglia.

7110. Rosin, Arnold J. & Glatt, M. M. (Guy's Hosp., London, England) **Alcohol excess in the elderly.**

Quarterly Journal of Studies on Alcohol, 1971(Mar), Vol. 32(1-A), 53-59.—Studied the occurrence of problem drinking in people over the age of 65. 67 psychiatric and 36 geriatric Ss over 65 yr. of age provided details of social background, patterns of drinking, and factors precipitating excessive drinking. Women outnumbered men in a ratio of 3:2. 46% of the psychiatric group and 36% of the geriatric Ss lived alone. Ss' pattern of drinking fell into 2 categories: (a) long-standing excessive drinkers, and (b) those whose previous innocuous drinking was exacerbated by the effects of aging. In 43 Ss habitual excessive drinking was the most common factor in their drinking problem. Personality factors, e.g., neuroticism, self-indulgence, egocentricity, and a reliance on alcohol as a psychological support, were obvious in 16 Ss of the 1st category. Ss' drinking problems from the 2nd category were related to illness or environmental stress in old age. It is concluded that environmental circumstances are more prominent than personality factors in the elderly.—A. Farfaglia.

7111. Rubington, Earl. (Northeastern U.) **The changing skid row scene.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 123-135.—Studied changes occurring in the skid row social system and their consequences for alcoholics and their would-be helpers, on and off skid row. A false equation of behavior (drunkenness) with setting (skid row) had come to equal inappropriate drinking (alcoholism); thus, the skid row symbol had drawn attention from millions of developing problem drinkers. Denial is the major defense of the alcoholic, who finds a powerful ally in the skid row symbol. In the past, skid row types were (a) workers (seasonal migratory labor); (b) victims (there because of natural disasters, wars, family break-up, etc.); and (c) seekers (engaging in deviant pursuits). Unlike the old stereotype, new residents will be multiple-problem persons. Skid row is a vanishing social system with a declining population of deviants, and a rising rate of violent internal crime. Because of these changes, there will be a greater variety of troubles for control agents. (23 ref.)—A. Farfaglia.

7112. Sands, Patrick M. & Hanson, Philip G. (Veterans Administration Hosp., Houston, Tex.) **Psychotherapeutic groups for alcoholics and relatives in an outpatient setting.** *International Journal of Group Psychotherapy*, 1971(Jan), Vol. 21(1), 23-33.—Describes the treatment of alcoholics in use at the Texas Research Institute of Mental Sciences in Houston. "The kind of groups organized, frequently differing in respect to size, composition, and goals, have included orientation groups, spouses' groups, couples' groups, singles' groups, and an experimental group." Each group is described and its advantages discussed. An alcoholic's need for "a continuous significant and meaningful relationship with a group in order to maintain a productive life without alcohol" is implied, but emphasis is directed toward accumulating more evidence.—I. Linnick.

7113. Smith, James W. & Brinton, George A. (Shadel Hosp., Seattle, Wash.) **Color-vision defects in alcoholism.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 41-44.—Studied whether the high incidence of defects in color vision in alcoholics might indicate a genetic predisposition to alcoholism and cirrhosis. 172 male and 33 female alcoholic patients were tested at the beginning of their treatment with Ishihara plates for color vision. Ss who showed defects on their 1st test were retested at the end of the treatment period.

65 male and 13 female Ss were initially scored as defective in red-green color vision. On retesting them after treatment, 17 male and 5 female Ss showed deficiencies. The number of Ss showing significant defects on retesting indicates that the rate of red-green color vision defectiveness in alcoholics is essentially the same as that in the general population. Vitamin depletion, common in alcoholics, seems a likely explanation for the temporary color-vision defects.—A. Farfaglia.

7114. Sobell, Linda C., Sobell, Mark B., & Schaefer, Halmuth H. (Patton State Hosp., Calif.) **Alcoholics name fewer mixed drinks than social drinkers.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 493-494.—Found that Gamma type alcoholics (N = 25) were deficient in a basic response repertoire for names of types of mixed alcoholic drinks as compared with matched sample of social drinkers (N = 25) and alcoholic bartenders (N = 10). The deficiency is interpreted as a learning deficit.—*Journal abstract*.

7115. Wanberg, Kenneth W. & Horn, John L. (Ft. Logan Mental Health Center, Denver, Colo.) **Alcoholism symptom patterns of men and women: A comparative study.** *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 40-61.—Tested the hypothesis "that different patterns of alcoholism do exist, and that these patterns will be found among a population of [men and women] labeled 'alcoholics'." Data were gathered with the Drinking History Questionnaire, a 68-question inventory, selected for appropriateness in providing information about drinking symptoms and related behavior. Ss were 1657 men and 365 women admitted to the Alcoholism Division of a mental health center. Results show that persons who come to treatment for alcoholism perceive themselves as different along dimensions of symptom severity, drinking style, derived benefits, and associative problems from drinking. Linear composites are found among variables measuring drinking symptoms and behavior. (24 ref.)—S. R. Diamond.

7116. Wilkinson, A. Earl; Prado, William M., Williams, Woodrow O., & Schnadt, Frederick W. (Veterans Administration Hosp., North Little Rock, Ark.) **Psychological test characteristics and length of stay in alcoholism treatment.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 60-65.—Studied 132 male Ss, with a mean age of 44 and a mean problem-drinking history of 11 yr. through test batteries to assay the utility of the tests as predictors of treatment outcome. Each S was given the following tests: the Shipley-Hartford, Allport-Vernon Scale of Values, Kuder Preference Record, Worchel Self-Activity Inventory, EPPS & MMPI, and a biographical data questionnaire. Results indicate that for this alcoholism treatment (90-day) program utilizing a multidisciplinary approach and group psychotherapy, 3 of the psychological tests administered (Shipley-Hartford, Kuder, and Allport-Vernon) contributed nothing toward predicting successful completion of the program. The EPPS and the MMPI made limited contributions. The Worchel Self-Activity Inventory, however, has potential for predicting success along with some biographical data. Tests of self-disclosure are more effective than intellectual and cognitive tests in predicting program completion. (16 ref.)—A. Farfaglia.

Suicide

7117. Day, George. **Suicide: English style.** Per-

spectives in Biology & Medicine, 1971(Win), Vol. 14(2), 290-300.—Discusses causes of suicide attempts and illustrates with case histories the difference between endogenous depression and "dispiritment." It is stated that a feeling of shame almost invariably accompanies an attempt.—J. Crabbe.

7118. Greer, Steven & Bagley, Christopher. (King's Coll. Hosp., London, England) **Effect of psychiatric intervention in attempted suicide: A controlled study.** *British Medical Journal*, 1971(Feb), Vol. 1(5744), 310-312.—Presents a follow-up study of all patients presenting at the casualty department of King's College Hospital during the 1st 6 mo. of 1968 with deliberate self-poisoning or self-injury. Of 211 patients, 204 (97%) were traced after a mean interval of 18 mo. (range 1-2 yr.). Despite official hospital policy, 22% had not been seen by a psychiatrist before discharge; these 44 untreated patients were compared with the remaining 160 who had received either brief (1 or 2 interviews) or more prolonged psychiatric and social help. Subsequent suicidal attempts occurred significantly more often among untreated than among treated patients, prolonged treatment being associated with the best prognosis. The same trend was observed in respect to actual suicide. These findings held when the untreated and treated groups were controlled for other variables which were found to be correlated with outcome. Results indicate that psychiatric intervention is associated with a significant reduction in subsequent suicidal behavior. (15 ref.)—*Journal summary.*

7119. Jones, G. E. (Shenley Hosp., St. Albans, England) **Suicidio: Una aproximación clínica a su comprensión y predicción.** [Suicide: A clinical approach to understanding and prediction.] *Revista Argentina de Psicología*, 1970(Sep.), Vol. 2(5), 114-123.—Attempted to delineate those factors common to the presuicide patient which may allow the psychologist to predict that he does have a potential suicide to deal with. The significance of the following is emphasized: (a) apparent complacency accompanied by implicit rebellion against the restrictions in a situation; (b) inability to operate in situations without a great deal of structure; and (c) an inability to relate to others coupled with a general pessimism. The appearance of the 1st 2 in the same patient is, in particular, considered highly indicative.—S. M. Halpin.

7120. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Completed suicide and longevity.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 662.—Found that suicide rates in the United States were significantly higher in Western than in Eastern states, using a method developed by D. Lester. This phenomenon was characteristic of all 48 continental states.—*Author abstract.*

7121. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Geographical location of callers to a suicide prevention center: Note on the evaluation of suicide prevention programs.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 421-422.—Describes a method of evaluating the effectiveness of suicide prevention centers in which the location of callers to the center is compared with the location of suicides in the community. It is proposed that this method can serve to inform an agency whether it is reaching into the appropriate areas of a community and the agency can adjust its out-reaching activities accordingly.—*Journal abstract.*

7122. Sendbuehler, J. M., Bland, B. A., & Nemeth, G. (Queen Elizabeth Hosp., Montreal, Quebec, Canada) **Attempted suicide: I. Some statistical and psychiatric parameters.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 59-68.—Describes characteristics of a sample of 222 consecutive cases of attempted suicide seen in a Canadian hospital from 1962-1969. Emphasis was on the external and internal environment of the Ss with suggestions for future therapy and research. Suicidal Ss were analyzed regarding (a) the general population, (b) diagnosis and referral to treatment, (c) method of attempted suicide, (d) medical illness and accident proneness, (e) pregnancy and postpartum disorders, (f) attempts by calendar mo., (g) attempts by day of wk., and (h) social class. (17 ref.)—P. Hertzberg.

Crime

7123. Bennett, Walter H. (Mississippi State U.) **Assaultive and nonassaultive criminal behavior among rural offenders: An analysis of external restraints and degree of involvement.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4912.

7124. Carroll, James L. & Fuller, Gerald B. (Canadian Penitentiary Service, Kingston, Ontario) **An MMPI comparison of three groups of criminals.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 240-242.—Nonviolent, violent, and sexual groups of criminals were compared on the basis of MMPI performance. The nonviolent group differed from the sexual group on L, K, Pd, Pa, Sc, and Ma scales. The nonviolent and violent groups differed on the L scale. The age factor was a significant variable, and when this was controlled, the nonviolent group differed from the other groups on F, Sc, and Ma scales. The nonviolent group appeared to be hostile, confused in thinking, and manifested the most deviant personality picture.—E. J. Kronenberger.

7125. Cowden, James E., Peterson, William M., & Pacht, Asher R. (Wisconsin Dept. of Health & Social Services, Madison) **The validation of a brief screening test for verbal intelligence at several correctional institutions in Wisconsin.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 216-218.—The Wide-Range Vocabulary Test and the Otis Quick-Scoring Mental Ability Tests were administered to 80 1st admissions to correctional institutions. Regression equations were constructed to derive a table of IQ equivalents for a broad range of age groups. The IQ equivalents on the Wide-Range Vocabulary Test were correlated with Otis IQs as well as WAIS IQs. Moderately high positive correlations were obtained. The Wide-Range Vocabulary Test represented a valuable addition to the screening battery. Future research is discussed.—E. J. Kronenberger.

7126. Gendreau, Paul & Suboski, Milton D. (Trent U., Peterborough, Ontario, Canada) **Classical discrimination eyelid conditioning in primary psychopaths.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 242-246.—Compared conditioning rates of 29 psychopaths and 24 nonpsychopaths on classical eyelid discrimination. Psychopaths produced fewer CRs to both extinction and CS+ over 3 instructional sets. Although less responsive, psychopaths were not poorer discrimination learners according to a signal detection analysis of the data. Psychopaths' CR latency, amplitude, and slope

were similar to those of nonpsychopaths. Results suggest that psychopaths are not inferior conditioners to negative reinforcement, but rather that they employ different response sets than nonpsychopaths. (19 ref.)—*Journal abstract.*

7127. Goodwin, Donald W., Crane, J. Bruce, & Guze, Samuel B. (Washington U., Medical School) **Felons who drink: An 8-year follow-up.** *Quarterly Journal of Studies on Alcohol*, 1971(Mar), Vol. 32(1-A), 136-147.—Studied drinking problems in 223 convicted male felons in an 8-yr follow-up to an investigation carried out just before Ss were released from prison. The original study had revealed that 43% of the Ss were alcoholics and 11% were questionable alcoholics. In the follow-up study 94% of the group was located. Of the 176 Ss interviewed, 118 had experienced social, psychological, or medical problems associated with drinking. Differences between alcoholic and nonalcoholic Ss were: (a) $\frac{1}{2}$ the blacks were alcoholics and $\frac{1}{4}$ of the whites; (b) sociopathy was twice as common among the alcoholics; (c) of the 13 Ss who received a dishonorable discharge from the military services, 12 were alcoholics; and (d) as civilians, the alcoholics were more often arrested, reported more symptoms of depression, and had more familial psychopathological problems than the non-alcoholics. 38 of the 93 unequivocal alcoholics were in remission, all but 2 without psychiatric treatment. (21 ref.)—*A. Farfaglia.*

7128. Hammer, Max. (U. Maine) **Hypersexuality in reformatory women.** *Corrective Psychiatry & Journal of Social Therapy*, 1969(Win), Vol. 15(4), 20-26.—Discusses the difference between hypersexuality and promiscuity and the former's occurrence in reformatories for women.—*M. B. Merk.*

7129. Hare, Robert D. & Quinn, Michael J. (U. British Columbia, Vancouver, Canada) **Psychopathy and autonomic conditioning.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 223-235.—Utilized a delayed, differential paradigm to investigate electrodermal, cardiac, and vasomotor conditioning in 18 psychopathic, 18 nonpsychopathic, and 18 "mixed" inmates. 3 tones, each 10 sec. long, were presented 16 times each in random order, alone, or followed by a shock or slide of a nude female. The psychopaths gave very little evidence of differential electrodermal conditioning. However, they acquired differential cardiac and digital vasomotor responses just as readily as did the nonpsychopaths to the CS followed by shock or by slides. Neither group gave any evidence of differential cephalic vasomotor conditioning. The psychopaths exhibited a lower level of tonic electrodermal activity and were less electrodermally responsive than were the other Ss. There were no differences between groups in tonic heart rate or in cardiac or digital vasomotor responsivity. However, the psychopaths responded to shock with cephalic vasodilation while the nonpsychopaths responded with vasoconstriction. (34 ref.)—*Journal abstract.*

7130. Kilpatrick, Dean G., Cauten, Nelson R., & Roitzsch, John C. (U. Georgia) **Psychopathy, repression-sensitization, and anxiety.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 615-618.—Investigated the hypothesis that psychopathic prisoners classified on the basis of MMPI profiles should have lower scores on the Repression-Sensitization (R-S) scale than prisoners manifesting psychiatric disturbance or normal prisoners. MMPIs from 144 male prisoners were scored for the R-S

and MA scales. Analyses of variance indicate that Ss manifesting psychiatric disturbance had higher R-S and MA scores than normal or psychopathic prisoners. There was no difference between normal and psychopathic prisoners. In view of an r of .84 between R-S and MA scores, it is concluded that the 2 scales apparently measure the same thing. Implications of the findings for the diagnostic classification and prediction of response to treatment of prisoners are discussed. (21 ref.)—*Journal abstract.*

7131. Raychaudhuri, Manas & Mukerji, Kamal. (Rabindra Bharati U., Calcutta, India) **Rorschach differentials of homosexuality in male convicts: An examination of Wheeler and Schafer signs.** *Journal of Personality Assessment*, 1970(Feb), Vol. 35(1), 22-26.—In an attempt to cross-validate the W. M. Wheeler and R. Schafer signs of homosexuality in the Rorschach, 60 male adult convicts of a Calcutta jail, were divided into 4 equal groups: active homosexual, passive homosexual, sex-role disturbed, and heterosexual normals. The protocols of the individually administered Rorschach were examined for both Wheeler and Schafer signs of homosexuality. Statistical analyses reveal that while Wheeler's signs could differentiate only homosexuals (active and passive) and sex-disturbed convicts at .05 level of significance, Schafer's signs can differentiate most of the studied groups at level of significance varying between .01 and .05. Failure of the Schafer signs to distinguish between active and passive homosexuals as well as between sex-disturbed and heterosexuals is discussed with reference to the characteristics of prison subculture. (19 ref.)—*Journal abstract.*

7132. Roth, Loren H. (Federal Penitentiary, Lewisburg, Pa.) **Territoriality and homosexuality in a male prison population.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 510-513.—Reports observations on a prison population of 1,220 men, 107 of whom were known to be homosexuals. 14 of these Ss were known as forced homosexual "rapists." It was found that rapists, as well as other homosexuals, were concentrated in cell blocks, rather than in dormitories. It was found that, on the average, 1 rapist lived in the company of 3 or 4 other homosexual men in a specific territory. This living arrangement was regarded as having the practical effect of reducing the number of fights, and the possibilities of several rapists ganging up on less aggressive inmates.—*P. Hertzberg.*

7133. Russon, Gordon W. **Basic attitude in delinquency.** *Corrective Psychiatry & Journal of Social Therapy*, 1969(Win), Vol. 15(4), 38-48.—Traces the development of a list of traits indicative of attitudes which seem to be common to the motivation of delinquent behavior. The revised list contains 35 items as given in the text and as used in case assessment conferences—usually after the client has been under observation for 3 mo.—*M. B. Merk.*

7134. Swanson, Richard M. (U. Colorado) **Personal control, personality and behavior in a correctional setting: The clarification of a concept.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5644.

7135. Wolfgang, Marvin E. (U. Pennsylvania, Center for Studies in Criminology) **Who kills whom.** *Psychology Today*, 1969(Oct), Vol. 3(5), 54-56, 72-75.—In many major surveys it has been shown that most homicide victims are related to, are friends of, or are at least acquaintances of the murderer. This high proportion is found in the United States, England, Denmark, and

Africa. "Homicides . . . in general, are angry, impulsive acts usually committed during the heat of an argument." Reasons are suggested for various forms of murder among acquaintances.—E. J. Posavac.

Juvenile Delinquency

7136. Beck, Louis M. (Louisiana State U.) **Self-reported delinquent behavior in the adolescent and preadult careers of lawyers and ministers: A comparison.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4897.

7137. de Assis Repetto, Beatriz H. (Catholic U., Rio de Janeiro, Brazil) **Pesquisa sobre a agressividade em delinquentes juvenis.** [Investigation of aggressiveness in juvenile delinquents.] *Arquivos Brasileiros de Psicotécnica*, 1968(Sep), Vol. 20(3), 30-38.—Tested 14-20 yr. old delinquent boys (10 guilty of homicide and 15 involved in other crimes) and 30 normal controls for aggressiveness. Ss were given the Mira and Lopez Myo Kinetic Psychodiagnostic technique (MKP) and results were statistically analyzed. It was found that means between S groups did not differ significantly, but that differences within each of the S groups was very significant. Because of this result, quantitative analyses were made of each test within the MKP. The influence of personality vs. socioeconomic factors on delinquency is discussed in relation to these results.—P. Hertzberg.

7138. Dea, Kay L. (Columbia U.) **Concept of self in interpersonal relationships as perceived by delinquent and non-delinquent youth.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4893.

7139. Dean, Katherine I. (Florida State U.) **Father absence, feminine identification, and assertive-aggressiveness: A test of compulsive masculinity among institutionalized Negro juvenile delinquents.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4912-4913.

7140. Forer, Lois G. **No one will listen: How our legal system brutalizes the youthful poor.** New York, N.Y.: John Day, 1970. 352 p. \$8.95.

7141. Hook, Ernest B. & Kim, Dong-Soo. (Albany Medical Coll., N.Y.) **Prevalence of XYY and XYY karyotypes in 337 nonretarded young offenders.** *New England Journal of Medicine*, 1970(Aug), Vol. 283(8), 410-411.—Investigated the extent to which the XYY genotype is associated with antisocial behavior in children and adolescents. All inmates of 2 institutions housing nonpsychotic juvenile offenders with IQs over 70 were investigated. Results show that 4 cases of XYY karyotype were identified in the 337 investigated males. This incidence is roughly 8 times higher than the newborn rate which is 1.4/1000. All 4 Ss had committed offenses before age 11. All 4 Ss had heights in the upper quartile when compared with other institutionalized Ss, whereas IQs were 15 points lower than matched institutionalized controls.—B. A. Stanton.

7142. Kulik, James A., Sarbin, Theodore R., & Stein, Kenneth B. (U. Michigan) **Language, socialization, and delinquency.** *Developmental Psychology*, 1971(May), Vol. 4(3), 434-439.—Proposes that language or word knowledge generally, and delinquent slang and conventional vocabulary specifically, are related to delinquent conduct. A slang test was constructed and validated on samples of 100 matched pairs of delinquents and nondelinquents, 100 randomly selected pairs of

delinquents and nondelinquents, and 505 high school males. A 28-item slang test was found to be related to delinquency at a high level of confidence. Results indicate that while slang knowledge is positively related to delinquency, conventional vocabulary is negatively related and that both types of word knowledge enhance the distinction between delinquents and nondelinquents when used jointly in a prediction equation. It is suggested that in the socialization process delinquents learn more from the delinquent subculture than they do from the conventional institutions of society. (16 ref.)—*Journal abstract.*

7143. Levinson, Boris M. **Household pets in training schools serving delinquent children.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 475-481.—Conducted an exploratory survey on the use of animals in farm programs and domestic animals for pets in training schools. 112 out of 150 questionnaires (48% sample of children, 35% sample of institutions) were returned from children's training schools located in the United States. 38 schools which had farm programs indicated that cows and hogs were the most popular farm animals. 46 schools which permitted their children to own pets stated that dogs and cats were the most popular pets. In most schools children and staff cooperated in caring for the pets. The school census was not related to the ownership of pets. The questionnaire elicited many volunteered comments regarding pet ownership in the training schools. The therapeutic potential of pets is discussed.—*Journal abstract.*

7144. Redfering, David L. (Ball State U.) **The effect of group counseling on the connotative meanings of selected concepts held by delinquent adolescent girls in a state training school.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4473.

7145. Severy, Lawrence J. (U. Arkansas) **A review of social learning theories and exposure to delinquency.** *Rehabilitation Research & Practice Review*, 1970(Fal), Vol. 1(4), 37-50.—Outlines several learning theories which are of interest, and relates them specifically to exposure to delinquency and its consequences. Association is distinguished from exposure. The process in which a person incorporates that which he has been exposed to is studied. Formulations which deal with the process question are surveyed: social learning theories, process question, interactionists, differential association, reference group theory, and identification. A comparison of theoretical and conceptual sections is made. The social learning theories concerning delinquent behavior are presented. It is clear that the distinction between acquisition and performance has relevance for the counselor with respect to his orientation concerning his client's delinquent behavior. The counselor must identify and ascertain the strength of the association between his client and the associates which are exposing him to delinquent behavior. The counselor must also emphasize that exposure in and of itself does not lead directly to performance. (15 ref.)—A. M. Farfaglia.

the self-concepts of male problem youth. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3943.

Homosexuality & Sexual Deviation

7149. Pustel, G., Sternlicht, M., & Deutsch, M. (Willowbrook State School, Staten Island, N.Y.) **Feminine tendencies in figure drawings by male homosexual retarded dyads.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 260-261.—Ss were 18 pairs of adolescent and adult institutionalized mentally retarded male homosexuals. Each pair was composed of a masculine (active) and a feminine (passive) homosexual partner. Each S was asked to draw a self-image and an animal drawing. A strong feminine tendency, more pronounced among the passive than among the active homosexuals, existed in the drawings of these Ss. This result was also revealed in the animal drawings.—E. J. Kronenberger.

7150. Weinberg, Martin S. (Indiana U., Inst. for Sex Research) **Homosexual samples: Differences and similarities.** *Journal of Sex Research*, 1970(Nov), Vol. 6(4), 312-325.—Examined social and psychological adjustment differences among 3 sources of homosexuals in New York City and San Francisco. A questionnaire was distributed to members or patrons of the Mattachine Society, social clubs for homosexuals, and bars catering to homosexuals. Respondents from the different sources were compared with χ^2 tests. Similar differences were found in both cities between respondents from the different sample sources. That is, Mattachine respondents were older, more stable in residence and employment, and had considered themselves homosexual for a longer time. They had fewer friends, less contact with the homosexual subculture, and less acculturation to this subculture. Respondents from bars catering to homosexuals were the most concerned about their homosexuality becoming known and reflected the greatest restlessness in their changing of jobs and residence. On the scales of psychological adjustment, no significant differences were found between respondents from different sources. It is concluded that the systematic differences that exist are a function of the structural character of the different sample sources.—E. B. Jaffa.

7151. Wilson, Marilyn L. & Greene, Roger L. (New Mexico Highlands U.) **Personality characteristics of female homosexuals.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 407-412.—Tested the hypothesis that female homosexuals have personality profiles that differ from those of female heterosexuals, but are not pathological in nature. 46 normal (neither receiving or seeking professional help nor institutionalized) female homosexuals and 46 female heterosexuals completed the CPI, Eysenck Personality Inventory, and EPPS. There was only a slight personality pattern difference between the groups and neither group showed a pathological personality pattern.—*Journal abstract*.

MENTAL DISORDER

7152. Amidolare de Arias, Ana M., Coprez, Susana; Franzi, Adriana, & Leicach, Edgardo. (U. Salvador, Buenos Aires, Argentina) **El curso de psicoprofilaxis como elaboración de depresión post-parto.** [The course of psychoprophylaxis as an elaboration of post-partum depression.] *Revista Argentina de Psicología*, 1970(Sep), Vol. 2(5), 124-128.—Describes 1 patient's

reaction to pregnancy and childbearing, including the postpartum depression. The value of counseling during the later months of pregnancy in lessening this depressive stage is discussed.—S. M. Halpin.

7153. Burton, D. A. (Towers Hosp., Leicester, England) **A factor analysis of the Edwards Personal Preference Schedule and 16 PF in a psychiatric population.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 248-251. 80 patients were administered the EPPS and the 16 PF. A factor analysis of the test results yielded 12 factors with 7 factor clusters on the EPPS having considerable variance in common with the 16 PF. An explanation of 12 factors is presented. In general, it was felt that the EPPS and the 16 PF relate meaningfully to each other. It was also noted that the results do not provide as impressive a demonstration of the purity of the EPPS scale as they do of reproducing Cattell's 2nd-order factors.—E. J. Kronenberger.

7154. Crowe, Raymond R. & Colbach, Edward M. (U. Iowa, State Psychopathic Hosp.) **A psychiatric experience with Project 100,000.** *Military Medicine*, 1971(Mar), Vol. 136(3), 271-273.—Project 100,000 defines an attempt by the military to induct yearly 100,000 men who would normally not be admitted into service because of physical or educational deficiencies. A study was conducted in Vietnam to determine if Project 100,000 personnel were more likely to sustain psychiatric breakdown, to be noneffective, and to be given different diagnoses than personnel who were admitted to the service in normal channels. Experience at the psychiatric clinic demonstrated that the number of patients seen from the Project 100,000 cohort was 10 times as great as that seen from the regular service corps. There was no difference in the 2 groups in terms of diagnosis or severity of illness. Approximately twice as many project personnel were referred for administrative separation as were nonproject personnel. Possible explanations for these discrepancies are discussed.—G. A. Chum.

7155. Davidson, Park O. & Watkins, Robert E. (U. Calgary, Alberta, Canada) **Repressor-sensitizer differences in psychiatric patients on repeated exposures to film induced stress.** *Psychological Reports*, 1971(Feb), Vol. 28(1), 159-162.—Presented a stressful film twice to 39 psychiatric patients divided into 3 groups on the basis of their Repression-Sensitization scale scores. Skin conductance was monitored during the films and an adjective checklist completed after each film. Differences among groups fell just short of statistical significance on both stress measures. The effects of the repression-sensitization personality dimension do not seem to account for as large a part of the variability in psychiatric patients' ability to cope with stress as they do in studies using normal Ss.—*Journal abstract*.

7156. de Fundia, Toba A., Draguns, Juris G., & Phillips, Leslie. (Juan Fernandez Hosp., Buenos Aires, Argentina) **Culture and psychiatric symptomatology: A comparison of Argentine and United States patients.** *Social Psychiatry*, 1971(Jan), Vol. 6(1), 11-20.—Compared discrete manifestations and dominance patterns of symptomatology in biographically, socially, and diagnostically matched sets of 54 male and 42 female patients in Argentina and in the United States. Argentine males exhibited more passive symptomatology, coupled with avoidance of others, and emphasis on affect. Differences between the females in the 2 countries were similar in activity-passivity, but were accompanied by emphasis on thought in Argentina, and affect and

action in the United States. Parallels are noted between these findings and the results of comparative research with normal Ss in the 2 countries. Findings are discussed as supporting (a) R. Diaz Guerrero's (see PA, Vol. 41:15126) theoretical formulations on the prevailing sociocultural premises in Latin and North America; and (b) the view of psychopathology as an exaggeration and caricature of the normal, culturally mediated modes of adaptation. Methodological issues in comparing hospitalized patients across culture lines are discussed and the findings reported are traced to the interacting factors of patient behavior, community judgment, psychiatric impression, and hospital influence. (French & German summaries) (52 ref.)—*Journal abstract*.

7157. Diethelm, O. (Payne Whitney Psychiatric Clinic, New York, N.Y.) **Mania: A clinical study of dissertations before 1750.** *Confinia Psychiatrica*, 1970, Vol. 13(1), 26-49.

7158. Eisenthal, Sherman & Harford, Thomas. (Boston U., Medical School) **Correlation between the Raven Progressive Matrices scale and the Shipley Institute of Living Scale.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 213-215.—There was a substantial correlation between the Progressive Matrices and the Shipley Institute of Living Scale scores for 100 neuro-psychiatric patients. It is suggested, however, that the 2 instruments were not sufficiently similar to be interchangeable. The Shipley assigned more than twice as many patients to an impaired category as did the Progressive Matrices. Neither test significantly differentiated diagnostic categories. The culture-fair quality of the Matrices was not demonstrated. E. J. Kronenberger.

7159. Fenz, Walter D. (U. Waterloo, Ontario, Canada) **Heart rate responses to a stressor: A comparison between primary and secondary psychopaths and normal controls.** *Journal of Experimental Research in Personality*, 1971(Mar), Vol. 5(1), 7-13.—Assessed cardiac activity in anticipation of, and in response to a stressor in 10 primary and 10 secondary psychopaths, and in controls, who were selected on the basis of multiple objective criteria, including the Eysenck Personality Inventory, Lykken's Activity Preference Questionnaire, a modified version of the MA scale, and the MMPI. Reliable group differences were observed, which were interpreted in terms of stimulus deprivation due to institutionalization and the chronic need for stimulation of young psychopaths.—*Journal abstract*.

7160. Hunger, J. (U. Waldau, Bern, Switzerland) **Gedanken zur Irrtumskategorie als Wahnkriterium.** [Thoughts concerning categories of error as criterion for delusions.] *Psychiatria Clinica*, 1970, Vol. 3(4), 241-253.—With the help of ontological criteria as formulated by N. Hartmann and the ontological basic model of the subject-object relationship, delusions can be described as a disturbance of the patient fitting himself into his particular life sphere. This adjustment depends on the acts of thinking and perceiving, but even more so on affective attitudes ("emotional-transcendental acts"—of hoping, expecting, experiencing, fearing, loving, etc.). A brief characterization of these various human modes of experiencing and adjusting shows that the rational-cognitive element—emphasized in the diverse attempts at interpreting criterion of error—plays only a subordinate role, and should no longer be used in defining delusions.—*English summary*.

7161. Irizarry, Raymond. (Security Treatment Center, Middletown, Conn.) **Anxiety, repression and varieties**

of anti-social behavior in psychopaths. *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 56-61.—To determine if psychopaths with low anxiety are afflicted with a variety of neurosis, 17 psychopaths reporting low and 15 reporting high anxiety were examined with a variety of projective techniques. The use of repressive defenses, accuracy of cognition, and existence of areas of intrapsychic conflict were compared. Variance analyses indicate that the low anxious psychopaths represented a mixture of psychopathic types with a wide range of use of repressive mechanisms. Analysis of uncommon themes on the TAT produced a list of apparent appropriateness for both types of Ss. (20 ref.)—*Journal abstract*.

7162. Loeb, Armin; Beck, Aaron T., & Diggory, James. (Horizon House, Philadelphia, Pa.) **Differential effects of success and failure on depressed and nondepressed patients.** *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 106-114.—It was hypothesized and supported that a small success on a "seemingly irrelevant task" would increase the performance level and self-esteem of depressed patients. Furthermore, while initial success improved the performance of depressed patients on the repetition of a task, initial failure improved the performance of non-depressed patients. (18 ref.)—R. Denis.

7163. Miskimins, R. W., Braucht, G. Nicholas; Wilson, L. T., & Berry, K. L. (Colorado State U.) **Self-concept and psychiatric symptomatology.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 185-187.—Considered the relationship between various self-concept configurations and a large number of specific psychiatric-behavioral symptoms. 346 Ss completed the Miskimins Self-Goal-Other (MSGO) Discrepancy Scale, and psychiatric-behavioral symptomatic information was obtained on these Ss from 34 symptom ratings by a psychiatrist or psychologist following an interview. The relationships within 5 factors are discussed. Results indicate that self-concept measurement is applicable to patients with psychotic symptomatology and that "the addition of such information as 'perceived evaluations of others' and direction of discrepancies adds dimensions necessary to reflect these forms of maladjustment." E. J. Kronenberger.

7164. Misra, S. L. (Army Hosp., Delhi, India) **Effect of birth order, education and rank status on insecurity.** *Psychology Annual*, 1969(Mar), Vol. 3, 17-19.—Administered Maslow's Security-Insecurity Inventory to 60 normal and 60 psychiatric patients matched for birth order, education, and military rank. Results indicate that 1st born, low educated, and low rank Ss tended to manifest more insecurity than later born, higher educated, and higher rank Ss. (15 ref.)—S. Knapp.

7166. Müller-Braunschweig, Hans. (U. Giessen, Psychosomatic Clinic, W. Germany) **Zur Genese der Ich-Störungen.** [Concerning the genesis of ego-disturbances.] *Psyche, Stuttgart*, 1970(Sep), Vol. 24(9), 657-677.—Pathogenic interactions with parents during early infancy often bring about the internalization of tension-laden introjects which permanently overtax the integrative and control functions of the ego. A detailed case history illustrates how traumatic stimulation by the mother produces an archaic subsystem of the ego which

preserves early, primitive ego states. The maternal introject, strongly cathected, cannot be integrated, but remains isolated. An entire sequence of interactions, affects, and situations is chained into an unintegrated "program." In certain situations (love relations, transference in analysis) which trigger this isolated system, the enfeebled ego reacts with intensified defenses and regressions so that the boundary between self and object may become blurred. (36 ref.)—*English summary.*

7167. Myers, Richard W. (Iowa State U.) **Effects of motivational incentives on GATB "F" and "M" subtest performance with hospitalized neuropsychiatric patients.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4470.

7168. Pasternack, Stefan A. (National Naval Medical Center, Naval Hosp., Bethesda, Md.) **Evaluation of dangerous behavior of active duty servicemen.** *Military Medicine*, 1971(Feb), Vol. 136(2), 110-113.—In an approximately 1-yr period, 34 cases of dangerous behavior as a primary reason for hospitalization were examined. Background behavior revealed parental brutality, school and learning difficulties, personal experience with violent death, compulsive fire setting, and torturing of pets as important precursors of violent behavior in adult life. These individuals tended to be somewhat schizoid, have poor ego-defense mechanisms, sadomasochistic relationships with spouses or relatives, a history of fugue states, and a readiness to attack others. Crimes of violence tended to occur in individuals who had been threatened by others or who had a history of alcoholism and drug abuse. A combination of these factors should be used by the physician to detect potential criminal behavior.—*G. A. Clum.*

7169. Pethő, B. & Szilágyi, A. (Neurological & Psychiatric Clinic, Budapest, Hungary) **Von der nosologischen Lage des Ekbom-Syndroms: Beitrag zur Weiterentwicklung der Symptomatologie Körperlich begründbarer Psychosen.** [The nosological situation of the Ekbom syndrome: Contribution to the improvement of symptomatology of organic mental disorders.] *Psychiatria Clinica*, 1970, Vol. 3(5), 296-319.—Analyzes results of the catamnestic findings in a case of Ekbom's syndrome and offers 2 recommendations: a sharper delineation of the syndrome, and expansion of the symptom spectrum. A case is described which is characterized by a chronic organic syndrome, a normal state of consciousness, fusion and disintegration of Gestalt, narrowing of the environment, isolated transitional negative and positive symptoms, and intact higher functions. It is suggested that the symptom spectrum of the transitional syndrome be expanded and named the "organotropic psychosyndrome" which would offer better nosological possibilities for differentiation between endogenous and exogenous psychoses. (English summary) (62 ref.)—*B. A. Stanton.*

7170. Sarwer-Foner, G. (Queen Elizabeth Hosp., Montreal, Quebec, Canada) **An object relationship evaluation of depressive illness: I. Patients who still relate to external objects.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 69-81.—Presents a clinically based intermediary phase of work with depressed patients in which the Ss are grouped in terms of their capacity to form object relationships. Factors involved in their illness, e.g., symptoms and related psychodynamic tendencies, behavioral concomitants and manifestations, personality and characterological correlates, are measured on a 5-point scale. The effec-

tiveness of different therapeutic technicalities is assessed in terms of this material (35 ref.)—*P. Herzberg.*

7171. Serafica, Felicissima C. (Clark U.) **Object concept in deviant children.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 473-482.—Tested 8 4 8 yr. old children manifesting deviant development on a scale devised by I. Uzgis and J. Hunt for visual pursuit and permanence of objects, using (a) preferred, and (b) neutral objects. Ss responded as if they had attained the 6th stage of object concept development, although consistency of performance varied between preferred and neutral objects. (28 ref.)—*Journal abstract.*

7172. Spiegelberg, U. & Betz, B. (Psychiatric Clinic of Stuttgart Citizens' Hospital., W. Germany) **Sozial- und Erlebnisfeld bei Neurosen und Psychosen. (Klinisch-statistische Untersuchung).** [Social and situational field with neuroses and psychoses (clinical and statistical investigation).] *Zeitschrift für Psychotherapie und Medizinische Psychologie*, 1970(Sep), Vol. 20(5), 199-207.—Investigated the occurrence of disruptive situations prior to onset of psychotic or neurotic illness in a random sample of 1,001 patients in a neuropsychiatric clinic. Correlations were ascertained between diagnostic groups, age groups, sex, and resulting situational disruptive complexes (economic situation, residential conditions, occupational circumstances, external isolation, marital contact, etc.). Poor economic circumstances and occupational and intrapersonal conflicts were found more frequently in neurotics than in psychotics. All disruptive environmental situations were more frequent in neurotics than in controls (neurological patients), whereas, psychotics were distinguished from controls only in terms of the frequency of occupational and intrapersonal problems. In addition, occupational and intrapersonal problems were found with greater frequency in younger Ss. *English summary.*

7173. Stillman, Stephen. (Ohio State U.) **Mental illness and peer group popularity.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 202-203.—31 patients in an exit unit and 12 staff members made sociometric nominations of most healthy, least healthy, best known, and least known from a list of 39 ward patients. "The results suggest that degree of mental health is related to quantity of social interaction and that patients and staff closely agree in their ratings of patient health-sickness."—*E. J. Kronenberger.*

7174. Vatankeh, H. M. (U. Isfahan, Psychiatric & Psychotherapeutic Polyclinic, Iran) **Psychoneurotische Störungen bei Frauen im Bezug zu Ihrem Sozialstatus.** [Psychoneurotic disturbances in women in connection with their social status.] *Confinia Psychiatrica*, 1970, Vol. 13(1), 50-56.—Describes experiences with 290 Iranian women of various ages seen within 30 mo. for psychoneurotic and psychosomatic disturbances. In 290 Ss, the illness was obviously related to social situations. There were 3 main groups: Ss with marital problems, Ss with hereditary constellations, and Ss in whom professional and training handicaps were pathogenic. In all groups, tensions and conflicts occurred from specific attitudes and circumstances (seclusion and subordination) in which Iranian women are living. Meeting with Western forms of living made these attitudes doubtful. Ss causing many Ss to be insecure and fearful. Ss experienced their social status as suppressing their personalities. Chronic situations of denial brought about frustrations and self-directed aggressions. Open aggression was observed only in those Ss suffering chiefly from

psychosomatic disturbances, while in the 2 1st mentioned groups there prevailed depressive, phobic, and anxiety reactions. None of the Ss, with the exception of 2 in the 3rd group, had spontaneously attempted to find a solution or to break loose. A fatalistic attitude and deeply rooted resignation combined with ideas of moral value hindered them. Disease served as a means of evading a decision of choice between old tradition and new Western forms of life. (32 ref.)—*Journal summary.*

7175. Weissman, Myrna M., Paykel, Eugene S., Siegel, Risé, & Klerman, Gerald L. (Yale U., Medical School) **The social role performance of depressed women: Comparisons with a normal group.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 390-405.—Compared the social role performance of 40 acutely depressed 25-60 yr. old women with a matched nonsymptomatic normal group, using a semistructured interview. Results indicate that depressed Ss were significantly more impaired in all roles. The degree of the depressive's impairment in intimate interpersonal relations provides a significant context for understanding symptom formation and treatment processes. (29 ref.)—*Journal abstract.*

7176. Woodruff, Robert A., Clayton, Paula J., & Guze, Samuel B. (Washington U., Medical School) **Hysteria: Studies of diagnosis, outcome, and prevalence.** *JAMA: Journal of the American Medical Association*, 1971(Jan), Vol. 215(3), 425-428.—Summarized the results of a number of recent studies of hysteria. There is evidence that hysteria, defined by objective criteria, is a syndrome distinct from other psychiatric syndromes, distinct from medical illness in which there are multiple complaints, and distinct from cases in which conversion symptoms occur in relative isolation. The central clinical feature of hysteria is any array of complaints spread throughout the symptom review. This concept of hysteria has been useful as an instrument of research, and serves as an important aid of the process of decision making for a group of patients whose management is difficult. (15 ref.)—*Journal abstract.*

Neurosis & Emotional Disorder

7177. Borcham, John. **An atypical depressive record.** *British Journal of Projective Psychology & Personality Study*, 1968(Dec), Vol. 13(2), 3-6.—Describes the case of a 73-yr-old Czechoslovakian refugee who developed a neurotic depression after his escape to England in 1939. During 25 yr. of psychiatric care, there was a worsening in his ability to play a part in the lives around him and a loss of belief in himself, e.g., loss of appetite was accompanied by a feeling that he was unworthy of proper food. The Rorschach test shows a lively personality suffering from a persecutory anxiety, with unconscious content concerning latent homosexuality and castration fantasies. The diagnostic picture comes into the general area of a hysterical anxiety state. Because of the atypicality of the Rorschach record, a clear diagnosis is difficult. The diagnosis is that "of a depressive reaction, concerning unconscious guilt, against a background of hysterical character structure." The depression is reactive to environmental stress and results in the impoverishment of a basically lively personality.—*A. Farfaglia.*

7178. Flomenhaft, Kalman. (U. Denver) **Treatment of emotionally disturbed adolescents.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4273.

7179. Ihilevich, David & Gleser, Goldine C. (Shiawassee County Community Mental Health Center, Owosso, Mich.) **Relationship of defense mechanisms to field dependence-independence.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 296-302.—Reexamined the relationships between defense mechanisms and field articulation using 50 male and 60 female psychiatric patients. It was found that (a) Ss who relied excessively on "global" defenses (turning-against-self and reversal) were more field dependent than Ss who relied on "differentiated" defenses (turning-against-object and projection); and (b) Ss who did not rely on any 1 defense were intermediate on field articulation. Knowledge of major defense allowed for prediction of cognitive style, but knowledge of cognitive style permitted prediction of only clusters of defenses. Characteristic defense appeared to be a function of both cognitive style and learning experience. When matched for defense style, men were more field independent than women on the Embedded Figures Test, but not on the Figure Drawing Test. Reversal was the most effective as a defense against anxiety for males, but not for females as judged by Repression-Sensitization Scale scores. (23 ref.)—*Journal abstract.*

7180. Kimsey, Larry R. & Frost, Mary. (U. Texas, Southwestern Medical School, Dallas) **Long term camping for emotionally disturbed boys.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 35-40.—Describes "an unusual and encouraging approach to the treatment of emotionally disturbed boys." A survey based on the case histories of 50 8-14 yr. old boys enrolled in the Dallas Salesmanship Club Boys Camp for an average of 16 mo. is reported. The 840-acre wooded camp area includes a lake for swimming and boating, and campers live in tents which they design and build. The boys, accepted on the basis of need, have been unable to receive help from other available treatment programs, including psychiatric hospitalization and outpatient psychotherapy. Adequate adjustment for life is the goal for each camper, and it is estimated that 70% make satisfactory adjustment during the postcamp period. Although no formal education is attempted during the camp experience, the boys "learn from source material in the experience curriculum." Follow-up studies indicate that the majority successfully reenter school at their appropriate age-grade level. "Although developed outside traditional psychiatric concepts," the camp offers an opportunity for psychiatrists and health workers to reappraise methods of dealing with the emotional problems of children and adolescents. (15 ref.)—*P. McMillan.*

7181. Kirby, Franklin R. (Michigan State U.) **Family drawings, individual/group identity and growth.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4998.

7182. Olczak, Paul V., Donnerstein, Edward; Hershberger, Thomas J., & Kahn, Irwin. (Northern Illinois U.) **Group hysteria and the MMPI.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 413-414.—Reinvestigated the plausibility of an hysterical personality following a labeled case of a group conversion reaction. 96 high school students, including those who manifested the symptoms, were administered 100 items from the MMPI, including the Hysteria scale. Chi square analysis showed significantly more females manifested hysterical physical symptoms than males, while the over-all analysis of variance, although in the

expected direction for females, indicated no significant sources. Results support the traditional view of hysteria being a "female syndrome" but were equivocal concerning "personality view" that a particular personality leads to a specific set of symptoms.—*Journal abstract.*

7183. Portnoy, Sanford M. (U. Massachusetts) **Power of child care worker and therapist figures and their effectiveness as models for emotionally disturbed children in residential treatment.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5005.

7184. Reynolds, Susan C. (Columbia U.) **The relationship between ability to read and the meaning and expression of emotion: A study of lower class, institutionalized boys with anti-social behavior problems.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5636.

7185. Serber, Michael. (Atascadero State Hosp., Calif.) **Drug dealing paranoia.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 529-530.—Presents case histories of "drug dealing paranoia," a recently observed clinical entity, which have been successfully treated in 2 of 3 cases. Onset of paranoid symptomatology was the direct result of selling drugs in a "drug scene." The paranoid symptoms observed ranged from moderate to severe, and complete remission of symptoms in all cases reported occurred within 1 wk. after cessation of drug dealing and temporary physical removal from the drug environment. In areas where drug use is extensive this syndrome is likely to be exhibited by patients who seek attention and thrills by becoming "amateur" drug dealers. Minor tranquilizers were prescribed in 2 of the 3 cases.—*Journal abstract.*

Psychosis

7186. Engel, W. King & Meltzer, Herbert. (National Inst. of Neurological Diseases & Stroke, Bethesda, Md.) **Histochemical abnormalities of skeletal muscle in patients with acute psychoses.** *Science*, 1970(Apr), Vol. 168(3928), 273-276.—In an experiment with 29 acutely psychotic patients (mostly schizophrenic), histochemical abnormalities of a myopathic type were demonstrated in skeletal muscle biopsies from 13 Ss and were generally correlated with elevation of the "muscle" type isoenzymes of creatine phosphokinase in Ss' serum. The incidence was much higher than found in normal controls, hospitalized neurotic psychiatric patients, or parents of acutely psychotic patients. A diazo-coupling type of "alkaline phosphatase" reaction was particularly useful in identifying abnormal muscle fibers.—*Journal abstract.*

7187. Layne, Ottis L. & Yudofsky, Stuart C. (Baylor Coll. of Medicine, Houston, Tex.) **Postoperative psychosis in cardiectomy patients: The role of organic and psychiatric factors.** *New England Journal of Medicine*, 1971(Mar), Vol. 284(10), 518-520.—Studied 58 cardiectomy patients and 20 patients undergoing major vascular surgery to assess the roles of organic factors, sleep and sensory deprivation, and psychiatric factors in the development of postoperative psychosis. $\frac{2}{3}$ of the cardiac patients were psychologically evaluated before operation, and extensively interviewed and encouraged to discuss the emotional aspects of their surgery. Findings include a 14% overall prevalence of postoperative psychosis in cardiectomy patients, with increased percentages in males, older patients, patients undergoing aortic-valve replacement, those with neurologic and

other organic abnormalities, and those expressing minimal preoperative anxiety. The preoperative psychiatric interview was associated with a reduction of postoperative psychosis by 50%. Results support the contention that postoperative psychosis in cardiectomy patients is multidetermined.—*Journal abstract.*

7188. Maller, O. (Pardessia Government Mental Hosp., Tel-Aviv, Israel) **The therapeutic community with chronic patients: II.** *Psychiatric Clinica*, 1970, Vol. 3(4), 205-220.—Describes the therapeutic community (TC) as being an integral means for the treatment of the mentally ill in an open pluralistic and osmotic society. The TC does not strive to rebuild but to readapt the patient to conditions of society, especially with respect to the long-term patient who requires more caution and time. The dynamics between role, motivation, and reward differ in the neurotic, the acute psychotic, and the chronic psychotic patient. The TC transcends other forms of therapy (e.g., family therapy, group therapy, milieu therapy) in that the staff must play a polarizing role. The main tasks of a polarized TC are to encourage communication which leads to mutuality, responsibility, self-realization, and increased understanding.—*Journal summary.*

7189. Paul, Michael L., Cramer, Hinrich, & Bunney, William E. (U. California, Neuropsychiatric Inst., Los Angeles) **Urinary adenosine 3',5'-monophosphate in the switch process from depression to mania.** *Science*, 1971(Jan), Vol. 171(3968), 300-303.—In experiments with patients on 2 metabolic research wards, marked elevations of urinary adenosine 3',5'-monophosphate occurred on the day of rapid switch from a depressed into a manic state in 1 male and 5 female 20-45 yr. old patients with manic-depressive illness. This further indicates the importance of biochemical changes in this illness. It is suggested that this increase might serve a trigger function for the process by which catecholamines are elevated during the manic phase of the illness. (18 ref.)—*Journal abstract.*

Schizophrenia

7190. Altschule, Mark D. & Nayak, Ullhas. (Harvard Medical School, Boston, Mass.) **Epinephrine-cyclizing enzyme in schizophrenic serum: Preliminary report.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 51-52.—Examines the hypothesis that schizophrenia is based on the excessive transformation of epinephrine to adrenochrome. Studies were made of the activity of the cyclizing enzyme in human serum. Serum was prepared, using venous blood from 30 normal 16-75 yr. old Ss. The blood of 13 schizophrenic patients, 11 with chronic disorders and 2 with recent onset of symptoms, was also studied. The normal range was from 1.75-6.75 uu M/ml/hr. The values in the 11 chronic schizophrenic Ss lay between 1.25 and 2.8; the 2 Ss with recent onset had values below 1 uu M/ml/hr. It is concluded that an "epinephrine-cyclizing catalyst is present in normal human serum. Its activity is not increased in schizophrenia." (26 ref.)—*P. McMillan.*

System, 1970(Nov). Vol. 31(11, Suppl.), 145-148.—Analyzed the 1957-1962 records of psychiatric hospital patients to determine the characteristics of schizophrenic and psychoneurotic Ss who did not improve during hospitalization. Ss included 924 patients who improved and 271 who were unimproved. 38 variables are reported, and more differences were found between the unimproved and improved schizophrenics. The unimproved schizophrenics were more often involuntarily admitted, less frequently married, lower in social class, or less likely to have a college education than the improved schizophrenics. The unimproved schizophrenics received less psychotherapy, and were less likely to have received phenothiazine treatment during hospitalization. In both diagnostic categories, the unimproved Ss were characterized by a more insidious onset of the illness, a worse initial prognosis, a shorter course of hospitalization, and less insight at the end of hospitalization.—*Journal summary*.

7194. Cammer, Leonard. (110 E. 82nd St., New York, N.Y.) **The delusional process in schizophrenia.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 117-121.—Delusions and other thought disorders in schizophrenia are nonspecific responses to disturbed brain function; these are considered to be of a primary disorder. Equally important are the delusions which are nonspecific adaptations to anxieties generated by any threat to biosocial integrity; these are related to secondary, adaptive processes. The onset and characteristics of each delusion, the setting in which it appears, and the nature of the associated symptom complex help to establish the existence of schizophrenia and to define its clinical and pathologic status.—*Journal summary*.

7201. Johnson, James E. & Petzel, Thomas P. (Loyola U., Chicago, Ill.) **Temporal orientation and time estimation in chronic schizophrenics.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 194-196.—A schizophrenic group of 40 hospitalized Ss and a control group of 40 Ss taken from the patient files of a general practitioner were utilized. Each S was interviewed about his past and asked to estimate the passage of time in 2 conditions. Schizophrenic Ss were not seriously deficient in reporting their own age when compared with normal Ss. For time estimation, evidence was found for temporal disturbance in brief intervals along with a trend in the direction of error. The data suggest that schizophrenics may experience time as passing more slowly than normals. "The conclusion of 2 psychiatric studies that temporal orientation becomes arrested in chronic schizophrenics after onset of their illness was disputed by the results of this study."—*E. J. Kronenberger*.

7203. Lovaas, O. Ivar; Schreibman, Laura; Koegel, Robert, & Rehm, Richard. (U. California, Los Angeles) **Selective responding by autistic children to multiple sensory input.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 211-222.—Reinforced 6 autistic, 5 retarded, and 5 normal children for responding to a complex stimulus involving the simultaneous presentation of auditory, visual, and tactile cues. After discrimination was established, elements of the complex were presented separately to assess which aspects of the complex stimulus had acquired control over the S's behavior. It was found that (a) the autistics responded primarily to only 1 of the cues, normals to all 3 cues, and retardates to 2 cues; and (b) conditions could be arranged such that a cue which had remained non-functional when presented in association with other cues could be established as functional when trained separately. Data fail to support theories that any 1 sense modality is impaired in autistic children. When presented with a stimulus complex, autistic Ss' attention was overselective. Findings are related to the literature on selective attention. Since much learning involves contiguous or near-contiguous pairing of 2 or more stimuli, failure to respond to 1 of the stimuli may be an important factor in the development of autism. (27 ref.)—*Journal abstract*.

7204. Marinow, Alexander. (Psychiatric Hosp., Bela (Roussenko), Bulgaria) **"Le soleil": Contribution à la psychopathologie de la schizophrénie chronique.** [*"The Sun": Contribution to the psychopathology of chronic schizophrenia.*] *Encéphale*, 1970(Jul), Vol. 59(4), 335-352.—Traces the case history of a chronic schizophrenic, nicknamed "The Sun," who has been under treatment since 1936. Statements made by the patient over a period of years are quoted to stress the degrees of

acute schizophrenia ranging from persecution fears to delusions of grandeur. The 2 worlds of the patient—the seminormal one of his environment and the private one of troubled psychosis in which he feels content and happy—are discussed. (2 p. ref.).—*I. Sirotnin.*

7205. **Mednick, Sarnoff A.** (New School for Social Research) **Birth defects & schizophrenia.** *Psychology Today*, 1971(Apr), Vol. 4(11), 49-50, 80-81.—The experimental-manipulation approach can be applied to the study of the origins of schizophrenia if one focuses on attempts to prevent schizophrenia. A study of 207 high-risk Danish children suggested that the children who did develop schizophrenia compared to those who did not, lost their mothers earlier, were more disruptive in class, behaved differently when associating words, were more aroused as measured by the GSR, and had experienced more severe pregnancy and birth complications. Programs are being developed on the island of Maritius to test the possibility of preventing schizophrenia using behavior therapy, conditioning, and substitute mothers.—*E. J. Posavac.*

7207. **Ostapczef & Ostapczef-Lavoine.** **Catatonie et syndrome extra-pyramidal.** [Catatonia and the extrapyramidal syndrome.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 256-261.—The complex syndrome of catatonia (negativism, stereotypy, hypertonia, etc.) is less often seen in its profound form today, as the result of improved institutional care and treatment methods. At the same time, extra pyramidal sequelae of psychotropic drug treatment for psychosis have become commonplace. The 2 cases described here are used to pose the question: To what extent may the extrapyramidal syndrome be an expression of catatonic communication? Beyond a certain degree of cure achieved with psychotropic medications, the commonly accompanying extrapyramidal syndrome may signify the persistence of a schizophrenic process.—*H. King.*

7208. **Parrish, Mary C.** (Mariallac School, Kansas City, Mo.) **Parents of autistic children: Their common needs and attitudes.** *Corrective Psychiatry & Journal of Social Therapy*, 1969(Win), Vol. 15(4), 14-19.—Attempted to determine if there is a commonality of attitudes toward child-rearing on the part of parents of autistic children. Instruments used were the EPPS and the Parental Attitude Research Instrument which showed that the greatest need for both parents together was for Deference and Abasement. Parents seemed to agree in child-rearing practices but mothers were characterized as being obsessive, irritable, and self-abasing. Fathers showed a strong need for deference. (21 ref.).—*M. B. Merk.*

7209. **Perlson, P. & Tobin, J. M.** (Northwest Psychiatric Clinic, Eau Claire, Wis.) **Treatment of psychic masochism in schizophrenic patients.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 122-129.—Treated 34 15-37 yr. old schizophrenics, who presented nonsexual, self-injurious behavior (psychic masochism), with a combined schedule of psychoactive drugs, (thioridazine, trifluoperazine, haloperidol, and perphenazine), transactional conceptualization, and deconditioning. 30 Ss achieved a significant degree of improvement. A hypothesis concerning the etiology of

this symptom complex, suggesting a possible relationship with the schizophrenic disorders, is offered. (54 ref.)—*Journal summary.*

7210. **Petrilowitsch, N., Winan, I., & Baer, R.** (U. Mainz, Neuropsychiatric Clinic, W. Germany) **Die Schizophrenen in strukturspsychiatrischer Sicht: II. Ergebnisse katamnestischer Untersuchung an 120 Kranken.** [Structural aspects of schizophrenia: II. Results of catamnesic investigation of 120 patients.] *Psychiatria Clinica*, 1970, Vol. 3(5), 257-273.—Presents catamnesic investigations on 120 patients to demonstrate that the symptom-productivity and intensity of the disease process can be measured by the succession of symptoms (i.e., the speed with which the symptomatological cross-sections change) and by the symptom capacity at any given time. One can differentiate polymorph-stabilized, relatively monomorph, as well as amorphous groups, finally among the delusional-systematized schizophrenics it is possible to differentiate between a polymorphous and a monomorphous form. The prognosis is better, the more polymorphous and turbulent the symptomatology. The polymorph-fluctuating form is closely related to the cyclothymic affective illness and nosologically should be classed as an affective psychosis. The polymorph-stabilized form occupies an intermediary position, while the amorphous and monomorphous forms represent the "malignant" schizophrenia. Among the delusional forms of schizophrenia, the polymorphous form has a substantially better prognosis than the monomorphous.—*English summary.*

7212. **Rychlak, Joseph F., McKee, Douglas B., Schneider, William E., & Abramson, Yitzchok.** (Purdue U.) **Affective evaluation in the verbal learning styles of normals and abnormals.** *Journal of Abnormal Psychology*, 1971(Jun), Vol. 77(3), 247-257.—Reports 3 studies on the influence of idiographic affective judgments of likability on the learning of CVC trigram materials among a total of 36 normals and 68 abnormals. The construct under study was termed reinforcement value (RV). It was hypothesized that whereas normals have been shown to acquire materials they judge to be positive more readily than those they judge to be negative in RV, an "RV-reversal" should be the case for abnormals. Findings on abnormals (primarily schizophrenics) were not unequivocally in line with an RV-reversal effect, but there was evidence in cross-validation to suggest that an abnormal learning style places less emphasis on acquisition of liked over disliked materials. A theory of learning based upon tautology is presented as explanatory of the findings. (28 ref.)—*Journal abstract.*

7213. **Sakamoto, Y.** (Sakamoto Hosp., Higashiosaka, Japan) **A study of the attitude of Japanese families of schizophrenics toward their ill members.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 365-374.—Investigates attitudes of Japanese families toward a schizophrenic family member, emphasizing differing recognition among family members. The closer (emotionally) a family member is to the ill member, the slower is his recognition of his mental illness. The mother is usually the last to recognize her son's schizophrenia, while outsiders are often 1st to recognize it. In cases of

physical illness, the opposite trend occurs. In Japanese families, members of the family are more oriented to the family and to society than to the individual. The lack of intrafamilial insight in the schizophrenic's family, however, seems, according to the literature, to exist in families in other countries. (15 ref.).—*English summary.*

7214. Seeman, Mary V. (U. Toronto, Toronto Western Hosp., Ontario, Canada) **Analysis of psychotic language: A review.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 92-99.—Presents conclusions derived from the study of psychotic language (a) language distortions that have been described in schizophrenic reactions are also found in neurotic and organic psychopathology; (b) tests of language can differentiate subcategories of schizophrenia; (c) language studies in schizophrenia have considered etiology in terms of attention defect, disturbed familial communications, regression to earlier development, and cultural stress, showing evidence for the 1st 2 factors; (d) studies with the deaf suggest that schizophrenic behavior need not result from cognitive dysfunctions; (e) schizophrenic language can serve expressive, neutralizing, wishfulfilling, distancing, binding, and personalizing functions; and (f) stages of recovery from a schizophrenic episode are accompanied by changes in language. (60 ref.).—*Journal summary.*

7215. Sendi, Smail B., Caldwell, Donald F., & Gottlieb, Jacques S. (Lafayette Clinic, Detroit, Mich.) **Comparative study of nailfold capillary structure in adult and childhood schizophrenia.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 14-19.—Examined a group of 30 psychotic and non-psychotic children (27 4-12 yr. old Ss, and 3 13-, 14-, and 16-yr-old Ss) regarding the capillary structures of their nailfolds and finger skin temperature. Both S groups showed an insignificant degree of plexus visibility. These groups disclosed a low degree (below 10%) of abnormal loops. A comparative evaluation of plexus visibility in childhood and adult schizophrenics indicates that plexus visibility could be diagnostic for a particular group of adult patients, contrary to childhood schizophrenics who have shown no sign of plexus visibility. 4 Ss registered low skin temperature, 3 exhibited plexus visibility, and 2 of the latter had organic psychoses. Data support the previous findings of the relationship between plexus visibility and finger skin temperature. Large numbers of a sample are required to pursue the significance of plexus visibility in the nailfold of Ss with childhood schizophrenia, and in a group of children with organic psychosis. (18 ref.).—*Journal summary.*

7216. Silverman, Lloyd H., Pettit, Tupper F., & Dunne, Edward J. (Veterans Administration Hosp., New York, N.Y.) **On the relationship between self-object differentiation, symbiotic experiences and pathology reduction in schizophrenia.** *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 118-128.—Studied the relationship between self-object differentiation and pathology reduction in schizophrenia. Data from a number of studies are presented in which a variety of symptomatic therapeutic interventions were utilized and the following 2 findings consistently emerged: (a) it was the initially more differentiated schizophrenics who responded to the interventions with significant reductions in pathology, and (b) accompanying this pathology reduction was diminished self-object differentiation. These findings were related to the therapeutic effect of symbiotic experiences on schizophrenics and theoretical

implications were suggested. (17 ref.).—*Journal abstract.*

7217. Stilson, Donald W., Walsmith, Charles R., & Penn, Nolan E. (U. Colorado, Medical School) **Effects of content on schizophrenics' ability to process information.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 571-574.—Examined the finding of R. Davis and R. Harrington (see PA, Vol. 33:1834) that schizophrenics were better able to process a given amount of information when the content of the task was abstract than when it was human. This finding was strengthened in a study of 25 schizophrenics, 25 nonschizophrenic psychiatric patients, and 26 hospital employees. The differential task performance of the schizophrenics is attributed to the greater amount of irrelevant information in the human task.—*Journal abstract.*

7218. Sutker, Patricia B. & Cauthen, Nelson R. (Tulane U., Medical School) **Paired-associate CVC learning with varied m' in schizophrenic patients.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 579-581.—Investigated the relationship between speed of acquisition in a paired-associate CVC learning task and scaled meaningfulness (m') in schizophrenics. 12 22-49 yr. old male Ss practiced on 3 lists (low, medium, and high m' level) of 10 stimulus-response pairs each. Findings indicate that rate of acquisition is a positive function of increasing m' in schizophrenic Ss.—*Journal abstract.*

Schizophrenia Treatment

7220. Blankenburg, W. (U. Freiburg, Psychiatric & Neuroclinic, W. Germany) **Tanz in der Therapie Schizophrenie.** [Dance in the therapy of schizophrenics.] *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 336-342.—Described the use of dance as a therapeutic modality in the treatment of schizophrenia. Various dances from different epochs in the history of dance were employed (e.g., Renaissance, Baroque). Dances and music from the Baroque period (e.g., minuet, polonaise) appeared to produce the best results in schizophrenic patients. Success was attributed to the ritualistic formality of these dances which was seen to be appealing to schizophrenic patients. (English summary) (29 ref.).—B. A. Stanton.

7221. Borenstein, P., Cujo, Ph., & Domaine, A. (Villejuif Psychiatric Hosp., Paris, France) **Effets électro-encéphalographiques du Décanoate de Fluphénazine.** [Electroencephalographic effects of fluphenazine decanoate.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 273-275. Studied effects of im 1970(Jul), Vol. 2(2), 273-275. Studied effects of im injected fluphenazine decanoate on the EEG in 34 chronic schizophrenic psychoses and compared the effects with those of fluphenazine chlorhydrate orally administered. The latter produce an unequivocal slowing in 80% of the patients. The basal rhythms were slowed to 1 cps with the appearance or augmentation of slow θ , usually diffuse. An increased sensitivity to hyperventilation was noted in 1/2 the cases. In contrast, decanoate did not produce significant EEG modifications in basal rhythms. An abundance of α was noted and, when used following the slowing influence of chlorhydrate, it reduced this and re-established normal

wave forms. No increased sensitivity to hyperventilation was noted. The action of fluphenazine decanoate on the EEG was comparatively less than that of major psychotropic agents in daily use, particularly that of fluphenazine chlorhydrate.—*H. King.*

7222. Spohn, Herbert E., Thetford, Paul E., & Cancro, Robert. (Menninger Foundation, Topeka, Kan.) **The effects of phenothiazine medication on skin conductance and heart rate in schizophrenic patients.** *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 129-139. Assessed the effects of chronically administered phenothiazine medication upon aspects of skin conductance and heart rate in 32 schizophrenic patients in 2 ways. Results, congruent with other studies, indicate that phenothiazines reduced the skin conductance level, elevated heart rate, and restricted frequency of specific and nonspecific reactivity in skin conductance and range of variability in heart rate. Moreover, it was shown that several of these effects were linearly related to daily dosage level. The implications of these findings for past and future uses of autonomically mediated psychophysiological variables in the study of phenothiazine-treated schizophrenic disorders are discussed. (15 ref.)—*Journal abstract.*

PSYCHOSOMATIC DISORDER

7223. Deree, Roland J. (Vanderbilt U.) **The relationship of social class and parental discipline practices to psychosomatic illness in young adults.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4917.

7224. Duret-Cosyns, S. & Luminet, D. **Les thérapies en médecine psychosomatique.** [Therapies in psychosomatic medicine.] *Acta Neurologica et Psychiatrica Belgica*, 1969(Feb), Vol. 69(2), 101-122.—Reviews difficulties encountered in the therapeutic management of psychosomatic patients. Patients must frequently be hospitalized as the result of severity of physical symptoms (i.e., hemorrhagic duodenal ulcers, malignant hypertension, or bronchial asthma). In such instances, collaboration between the internist and psychiatrist is of critical importance. The following forms of therapy are suggested as means of specific psychiatric intervention: (a) hypnosis in asthmatic crisis, (b) psychotherapy providing reassurance and relaxation in acute respiratory distress, and (c) analytically-oriented psychotherapy in severe ulcerative colitis. Problems include (a) the ambivalence and aggressiveness of physicians toward the neurotic attitudes and use of an illness as a defense against major psychosocial integration on the part of psychosomatic patients; and (b) the hospital environment and the attention provided by internists which tends to increase the patient's resistance to psychiatric treatment. Cases are presented to illustrate these problems. (German & English summaries) (17 ref.)—*P. R. Shibelski.*

7225. Levine, Matthew E. (Peter Bent Brigham Hosp., Medical Clinics, Boston, Mass.) **Depression, back pain, and disc protrusion: Relationships and proposed psychophysiological mechanisms.** *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 41-45.—Discusses the possibility of the existence of a psychophysiological mechanism in cases of associated depression, back pain, and disc protrusion. Earlier studies of animals have demonstrated swelling of intervertebral discs in situations of stress, and more recent studies indicate that

there may be a significant increase in the intracellular sodium of depressed patients, providing a possible explanation of the mechanism of stress-induced swelling. 2 cases are presented which illustrate important clinical features. Suggestions for a more conservative approach combined with psychiatric treatment are made, in light of the failure of surgical treatment in a significant number of patients, especially where depression plays a role in the development of symptoms. It is concluded that while traditional insight-oriented psychotherapy may not be indicated, psychiatric consultation could favorably affect the outcome in many patients.—*Journal summary.*

7226. Messner, K. (U. Freiburg, Medical Clinic, W. Germany) **Zur Schätzung der Intelligenz in einer psychosomatischen Klinik: Vergleich zweier Testbatterien.** [Estimation of intelligence in a psychosomatic clinic: Comparison of two test batteries.] *Psychologie und Praxis*, 1970(Jul), Vol. 14(3), 112-125.—Results of the HAWIE (German version of the WAIS) and Amthauer's Intelligence Structure Test (IST) were compared on the basis of a sample of 126 psychosomatically ill patients. The HAWIE has 10 subtests, the IST has 9. Factor analysis revealed 3 common factors which would account for both tests. A higher verbal component in the IST when compared with the HAWIE could not be proven by the data. The best estimate of intelligence in psychosomatically ill patients was made by means of an abbreviated HAWIE test which is based on 4 subtests and known as "WIP" in German. *R. F. Wagner.*

7227. Orbán, György & Szőnyi, Magda. (Medical U. of Szeged, Hungary) **A szokványos vetélések pszichoszomatikus vizsgálata.** [Psychosomatic examination of habitual abortion.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(3), 383-401.—Since traditional medical diagnostics do not provide any satisfactory explanation or adequate therapy for Ss with spontaneous and habitual abortions, the subject is considered from a psychosomatic point of view. Complex psychological examinations were carried out in 29 cases. Results support the hypothesis that psychic factors and action mechanisms may play a part in precipitating abortions. A specific personality constellation involving a disposition for abortion was revealed. This constellation is manifested in life patterns that show certain similarities, in specific styles of living, typical ways of responding to stimuli, typical thought processes, and specific conflicts and defense mechanisms. Habitual abortion Ss (not including Ss with organic lesions) may be characterized symbolically as persons who "miscarry" not only in the course of their pregnancy, but also in several other spheres of their lives. Only by the simultaneous application of gynecological and psychotherapeutic methods may therapeutic result be expected. (Russian summary) (16 ref.)—*English summary.*

7228. Spoerri, Th. (Berne U., Psychiatric Polyclinic, Switzerland) **Autogenic training and psychosomatic disorders.** *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 354-364.—Discusses the rationale for the use of autogenic training alone, and in combination with other forms of therapy. The clinical and motor-affective-vegetative effects lie in the particular patient-therapist relationship made possible by autogenic training. In the group of psychophysiological disorders, indications are based on actual possibility of autogenic training to influence the primary or secondary emotional vegetative disturbance. Autogenic training is seen to be of most use

in the treatment of psychosomatic cardiovascular disorders. Observations regarding the practice of autogenic training, on complications by different disorders, and on diverse variations (e.g., pre- or parahypnotic autogenic training) are made. (33 ref.)—*Journal summary*.

CASE HISTORY

7229. Denber, Herman C. (Manhattan State Hosp., New York, N.Y.) **An unusual case of chlorpromazine agranulocytosis.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 134-139.—Describes an unusual case of agranulocytosis in a 46-yr-old white female which developed after a long period of treatment with various phenothiazines. It is suggested that this may be a gene-linked disorder in about 1:3000 cases. (19 ref.)—*Journal summary*.

V. Kline*.

7232. Hughes, James E., Steahly, Lance P., & Bier, Martin M. (Walter Reed General Hosp., Washington, D.C.) **Marihuana and the diabetic coma.** *JAMA: Journal of the American Medical Association*, 1970(Nov), Vol. 214(6), 1113-1114.—Marihuana ingestion by a 21-yr-old man was followed by severe diabetic ketoacidosis. Following oral ingestion of marihuana, nausea, vomiting, diuresis, and an elevation of blood glucose level have been noted. It is speculated that when the stress of marihuana ingestion is greater than the adaptive capacity of the glucose-regulating system, diabetic ketoacidosis might evolve.—*Journal abstract*.

7233. Kolodny, Howard D., et al. (Queens Hosp. Center, Jamaica, N.Y.) **Acromegaly treated with chlorpromazine: A case study.** *New England Journal of Medicine*, 1971(Apr), Vol. 284(15), 819-822.—Short-term therapy with chlorpromazine, medroxyprogesterone acetate, and a combination of the 2 drugs was given to a 21-yr-old man with active acromegaly. Serial levels of serum growth hormone with the patient fasting and during 6-hr oral glucose tolerance tests were determined before treatment, during treatment, and between treatment periods. There was a marked decrease in fasting levels by the 12th day of each treatment period. On the 10th day of chlorpromazine therapy the fasting level was still above normal, though decreased from the base-line level. On the 12th and 17th days of this therapy fasting concentrations were near the normal range. The clinical manifestations improved during the course of chlorpromazine therapy. The known pharmacologic effects of chlorpromazine suggests that the site of its action on growth-hormone suppression is the hypothalamus. (19 ref.)—*Journal abstract*.

7234. Libo, Shirley S., Palmer, Carolyn, & Archibald,

Dorothy. (U. New Mexico, Medical School) **Family group therapy for children with self-induced seizures.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 506-509.—Explored the motivation for self-induced seizures in 2 photosensitive children, a 12-yr-old girl and a 10-yr-old boy. It was found that (a) supportive psychotherapy and family group therapy reduced guilt and anxiety in Ss and other family members enough to permit change in the family's pattern of handling S's symptoms; (b) the involvement of all family members, especially fathers, was essential in changing the family structure; and (c) behavioral control of this symptom is possible if families are able to alter their responses to the seizures and avoid unwittingly reinforcing them.—*P. Hertzberg*.

7235. Palem, R. M., Force, L., & Esvan, J. (St. Anne Hosp., Service of Neuropsychiatry, Toulon, France) **Hallucinations critiques épileptiques et délire: A propos d'un état de mal oculo-clonique.** [Hallucinations critical for both epilepsy and delusion: With respect to an oculo-clonic illness.] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 2(2), 161-190.—Presents a single case studied by clinical and EEG methods of interest from the viewpoint of both epilepsy and psychosis. The EEG has not yet been able to provide much specific information about hallucinatory or delusional states that allow a proper test of theory about their origin or mechanisms of action. A detailed study of the mental state of a patient suffering from oculo-clonic seizures, with their known connections with abnormal EEG tracing, may prove helpful. Three oculo-clonic seizures (epileptic nystagmus) are presented that are characterized by complicated visual hallucinations of a mystical nature closely connected with the abnormal electrical discharge. There was a more complex correspondence between the automatic and devotional phenomena and a chronic delusional organization based on these hallucinations.—*H. King*.

7236. Ribeiro da Silva, Athayde. **Problemas na área sexual.** [Problems in the area of sex.] *Arquivos Brasileiros de Psicologia Aplicada*, 1970(Jun), Vol. 22(2), 93-96.—Presents the case history of a 20-yr-old male with personality disorders attributed to a base of sexual neurosis. The family pattern included a violent father and submissive mother. The S manifested signs of an inferiority complex aggravated by an inferior physical appearance. A battery of psychological tests was followed by a recommendation of psychotherapy due to the recurrence of psychological impotence. *P. Hertzberg*.

MENTAL HEALTH & REHABILITATION

7237. Brooks, George W., Deane, William N., & Laqueur, H. Peter. (Vermont State Hosp., Waterbury) **Fifteen years of work therapy: Its impact on a mental hospital and its community.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl.), 161-165.—Discusses the reasons for the success and consequent failure of a work therapy program in which a group of mostly blue collar workers guided, trained, supervised, and evaluated patient workers and referred them for community placement. The program led to hardships both for hospital staff and patients. (22 ref.)—*P. Hertzberg*.

7238. Collingwood, Thomas R. (Hot Springs Rehabilitation Center, Ark.) **The role of adapted physical education and therapeutic recreation within reha-**

bilitation: A perspective. *Rehabilitation Research & Practice Review*, 1970(Fal), Vol. 1(4), 51-56.—Defines adapted physical education as a diversified program, adapted and changed to fit the abilities, problems, and physical limitation of the student or client. Therapeutic recreation refers to a broad spectrum of physical and social activities which facilitate an active involvement by participants in something pleasurable. At a simple level by participating in such programs, an individual can become more physically fit in order to develop hobbies, to become more active, to learn leisure time skills, and to undergo positive social and group experiences. On a deeper level, he can realize self-identification, overcome self-consciousness, develop self-confidence, express emotions naturally, respond to successes and failures, develop a better self-concept, and have the opportunity for self-evaluation along with self-satisfaction. Recreational services within rehabilitation are serving therapeutic purposes. A concentrated effort must be made to develop an awareness and a direction to structure recreation within rehabilitation to its full therapeutic potential. 5 suggested directions are made in order to implement the initiation of a recreational program.—A. M. Farfaglia.

7239. Dell'Apa, Frank. (U. Northern Colorado) **Congruence of counselor-client communication: A function of the rehabilitation process effectiveness with the correctional client.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 4052-4053.

7240. Jackson, James L. (Texas Rehabilitation Commission, Austin) **Extended rehabilitation services for the mentally and physically handicapped.** *Rehabilitation Literature*, 1971(Feb), Vol. 32(2), 43-44.—Describes a project conducted by the Texas Rehabilitation Commission to demonstrate the value of extended rehabilitation services to mentally retarded persons who are currently ineligible for such services because of the severity of the disability and the length of time required for their care. The project provides extended sheltered workshop employment as well as extended community living services for 30 severely mentally retarded individuals. The results of this pilot project are not yet available.—S. L. Warren.

7241. Klein, Donald. (National Training Lab., Inst. of Applied Behavioral Science, Washington, D.C.) **Community: Who needs it.** *Psychology Today*, 1969(Dec), Vol. 3(7), 32-35, 62.—It is necessary to use the resources of the community in mental-health programs. Regardless of what therapy or rehabilitation is performed, people cannot become successful if the community does not accept them. All security which people possess ultimately comes from the community. The community mental-health centers which have been organized have been helpful. More needs to be known, however, about the interaction of the community and the individual with respect to mental health.—E. J. Posavac.

7242. Lane, Joseph M. & Barry, John R. (Armstrong State Coll.) **Recent research on client motivation.** *Rehabilitation Research & Practice Review*, 1970(Fal), Vol. 1(4), 5-25.—Reviewed some of the current research on client motivation for rehabilitation in terms of intrinsic and extrinsic variables. Regarding intrinsic motivation variables, the role of the self-concept and its influence on behavior and motivation is emphasized along with the concept of hope. A useful method has been the correlational technique where several personality measures are gathered for each client at the

beginning of the rehabilitation process. These measures are correlated with outcome criteria to determine which measures are predictive of the specified outcome. Reinforcement contingencies, behavior modification, sociological factors, client-counselor relationship, and attitudes toward disabled persons are discussed as extrinsic motivation variables. It is concluded that the concept of motivation encompasses all aspects of behavior. There is very little research dealing explicitly and directly with motivation for rehabilitation, and researchers differ in their use of the term. (59 ref.)—A. M. Farfaglia.

7253. Kadushin, Phineas; Waxenberg, Sheldon E., & Sager, Clifford J. (New York Medical Coll.) **Family story technique changes in interactions and effects during family therapy.** *Journal of Personality Assess-*

ment, 1971(Feb), Vol. 35(1), 62-71.—Employed the Family Story Technique (FST) to explore changes over the course of brief family therapy with 82 family members. Family interactions showed varied and interesting changes, including a reduction in hostility between mothers and children and a more realistic view of family relationships. Affect related condition scores suggest a decrease in projected anxiety and an increase in anger on the part of 38 adult females as well as a reduction in children's projected guilt. The FST appears to be a useful modification of the TAT for use in clinical work and research with families.—*Journal abstract.*

7254. Kogan, Kate L. & Wimberger, Herbert C. (U. Washington, Medical School) **Behavior transactions between disturbed children and their mothers.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 395-404.—Observed 10 4-6 yr. old children, from families who had sought help from a university child psychiatry clinic, in the laboratory in interaction with their mothers. Ss each tended to exhibit some unique and deviant occurrences of certain classes of behaviors, but the only respect in which they systematically differed as a group from the comparison sample of 10 nonclinic mother-child pairs was in the more frequent occurrence of strongly controlling behaviors on the part of the mothers. This control characteristically occurred in the context of some degree of high status on the part of the child, whereas comparison children tended to be displaying neutral status. Comparison mothers tended to exercise their control by directing their children what to do, and clinic mothers by nonacceptance of what their children had already done. 2 illustrative cases summarizing the application of sequence analysis methods to understanding the unique interaction styles of individual pairs are presented.—*Journal abstract.*

7255. Ostow, Mortimer & Cholt, Betty. (Jewish Theological Seminary of America, Bernstein Center, New York, N.Y.) **Marital discord.** *New York State Journal of Medicine*, 1970(Feb), Vol. 70(2), 257-266.

Proposes that complaints involving the marital partner, in person seeking marital counseling, often mask self-dissatisfaction. Personal problems which existed prior to the marriage will not be solved, and may even be exaggerated, by the marriage. Mittelman has suggested that the selection of a marriage partner may serve to perpetuate and renew pathology. Oberndorf has reported that the need to possess another person is the result of unresolved Oedipal needs. "Having conquered and possessed the parental figure in the form of husband or wife, the neurotic spouse may then find himself sexually inhibited for having dared to transgress the incest taboo." Neurotic ties in marriage may include: (a) a didactic spouse and a dependent spouse, (b) a commanding spouse and a detached spouse, and (c) competing spouses. "A classification of marital disturbances may be achieved by categorizing both husband and wife respectively as normal, merely reactive to a disturbed spouse, sexually disturbed, or excessively anathetic." The most frequently observed combination at the Bernstein Center is a husband with a sexual disturbance and a wife with excessive anathetic needs. (17 ref.) B. A. Stanton

Social Casework

7256. Getzel, George S., Goldberg, Jack R., & Salmon, Robert. (Columbia U., School of Social Work) **Supervising in groups as a model for today.** *Social*

Casework, 1971(Mar), Vol. 52(3), 154-163. Describes the group supervision method in relation to content, technique, and timing. Experience over several years led the agency to conclude that group approach was superior to traditional supervisory methods. Group supervision offered an opportunity for lateral help and proved more consistent with agency organization and life. M. B. Linn.

7257. Miller, Steven I. & Miller, Patricia. (Loyola U., Chicago, Ill.) **Social work concepts and language analysis.** *Social Casework*, 1971(Mar), Vol. 52(3), 142-147. In order to determine whether social work, as a distinct body of knowledge, may be assisted in changing some of its basic concepts through the use of philosophy, a year-long tutorial project was undertaken. Both remedial and substantive aid was given to a selected group of 7 students working in graduate programs in social work. The focal areas were (a) difficulty in understanding the genesis of abstract psychological terminology, (b) confusion as to how theoretical concepts relate to an analysis of psychological disorders; and (c) the general role of inference in diagnosing a psychological impairment. There were some difficulties in the students' comprehension of theoretical concepts. It was felt that some use of contemporary language philosophy can aid social work students in understanding abstract terminology.—M. W. Linn.

PHYSICAL HANDICAP

7258. Cannell, Robert T. (U. Missouri) **Effects of physical disorders on the adjustment of hospitalized children.** *Dissertation Abstracts International*, 1971(1 eb), Vol. 31(8-A), 3987.

7259. Koschene, Ruby L. (Colorado State U.) **An analysis of aggression: Normal and physically disabled teen-agers toward normal and physically disabled peers and laboratory animals.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5628.

7261. Tringo, John L. (U. Kentucky) **The hierarchy of preference toward disability groups.** *Journal of Special Education*, 1970(Sum), Vol. 4(3), 295-306. Attempted to determine the existence and composition of a hierarchy of preference toward disability groups. A hierarchy of preference toward disability groups. A disability distance measure was scaled by the method of successive intervals and administered to 455 high school students, college students, and college graduates. A very high correlation coefficient between sample groups ($r = .94$) and between sexes ($r = .98$) indicated that a stable hierarchy of preference exists, despite a significant difference in absolute values. Age, education and sex of the Ss were found to affect the degree of social distance but not the relative position of a disability group in the hierarchy. *Journal abstract.*

Blindness & Visual Disorder

7262. Anderson, Edward T. (U. Illinois, Urbana-Champaign) **The development of a battery of power tests to predict job performance of the blind.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4638.

tion. Depending on the degree of cerebral metabolic disturbance and on the cerebral locale, there is a progressive continuum from the delirium tremens (via the protracted delirium) to the encephalopathy. Poor prognosis is recognized by the depth of consciousness and extent of neurological disturbance. Intensive vitamin B₁₂ therapy combined with chlormethiazole may prevent progression towards Wernicke's encephalopathy and arrest the disease process during its acute phase. (30 ref.)—*English summary.*

7284. Blonsky, E. Richard. (Northwestern U., Medical School, Chicago, Ill.) **The changing picture of parkinsonism: I. Neurological modifications resulting from administration of L-dopa.** *Rehabilitation Literature*, 1971(Feb), Vol. 32(2), 34-37.—Presents a brief review of the historical aspects and some of the basic biochemistry of L-dopa. The manner in which the symptoms of Parkinson's disease are affected by the drug is shown, as are the negative side effects. For those afflicted with the disease, emphasis is placed on eliminating their dependence on family and attendants. Physical and occupational therapy are considered important aspects of such a rehabilitation program. A group approach, besides being more economical, eliminates the laying on of hands—the parent-child symbol—that perpetuates dependency. S. L. Warren.

7285. Boyd, A. E., Lebovitz, Harold E., & Pfeiffer, John B. (Duke U., Medical Center) **Stimulation of human-growth-hormone secretion by L-dopa.** *New England Journal of Medicine*, 1970(Dec), Vol. 283(26), 1425-1429. Studied the effect of L-dopa, a precursor of CNS catecholamines, on growth-hormone secretion in a group of patients with Parkinson's disease undergoing treatment with the drug. Oral doses (.5 gm.) caused a significant rise in plasma growth hormone in patients initially starting therapy or on chronic therapy for as long as 11 mo. The rise in plasma growth hormone persisted for 120 min. after the administration of the drug. The L-dopa-induced rise in plasma growth hormone could not be blocked by either oral or iv glucose administration. Data suggest that a dopaminergic mechanism in the median eminence or a norepinephrine-sensitive site in the hypothalamus or limbic system may be involved in the regulation of growth-hormone secretion. Furthermore, patients with Parkinson's disease, on L-dopa therapy, appear to be under the influence of elevated plasma growth hormone for a substantial part of the day.—*Journal abstract.*

7286. Brody, Jacob A., Chase, Thomas N., & Gordon, Edna K. (National Inst. of Neurological Diseases & Stroke, Epidemiology Branch, Bethesda, Md.) **Depressed monoamine catabolite levels in cerebrospinal fluid of patients with parkinsonism dementia of Guam.** *New England Journal of Medicine*, 1970(Apr), Vol. 282(17), 947-950.—Depressed levels of homovanillic acid, the principal catabolite of dopamine, and 5-hydroxyindoleacetic acid, the major product of serotonin degradation in brain, were found in the cerebrospinal fluid of 7 Guamanian patients with parkinsonism dementia. Homovanillic acid concentrations in spinal fluid of 6 Guamanians with amyotrophic lateral sclerosis were also significantly lower than those observed in 6 Guamanian controls, although higher than those found in the patients with parkinsonism dementia. Monoamine catabolite levels in patients with parkinsonism dementia and amyotrophic lateral sclerosis on Guam were similar to those found in Americans with

idiopathic parkinsonism or classic amyotrophic lateral sclerosis, respectively. An alteration in cerebral monoamines similar to that previously found in classic Parkinson's disease may thus attend the parkinsonism-dementia syndrome of Guam. (23 ref.)—*Journal abstract.*

7287. Celestia, Gastone G. & Barr, Arlene N. (U. Wisconsin, Medical Center) **Psychosis and other psychiatric manifestations of levodopa therapy.** *Archives of Neurology*, 1970(Sep), Vol. 23(3), 193-200.—45 Ss with Parkinson's syndrome received 250 and/or 500 mg. of levodopa in oral dose. After the initial test Ss received 1,000 mg. of levodopa daily in 4 divided doses for 3 days. Dosage then increased by no more than 250 mg. every 3rd day until Ss showed beneficial results, or until they developed side effects, or until a total daily dose of 8 gm. was reached. Psychiatric manifestations occurring in 16 of 45 Ss included psychoses, acute anxiety, euphoria, and other phenomena. 14 of the 16 Ss developed generalized dyskinesia. Psychotic disorders emerged only after several wk. of maintenance on a dose that had been well-tolerated initially. Benefits of levodopa usage far outweigh shortcomings, particularly since psychic side effects can be reversed through dose modification or use of an antidepressant. Catecholamines and other brain monoamines appear to be implicated in etiology of psychotic disorders. Data on animals reveal levodopa administration is related to increase in content of brain norepinephrine, associated with excitement and sham rage. Animal data related to dopamine administration suggest its direct involvement in generating abnormal behavior. (25 ref.)—S. E. Gavin.

7288. Council on Drugs, American Medical Association. **Evaluation of levodopa for parkinsonism: Levodopa (Dopar, Larodopa).** *JAMA: Journal of the American Medical Association*, 1971(Mar), Vol. 215(12), 1969-1972.—Discusses levodopa which has proven to be highly effective for the treatment of parkinsonism. However, it may cause a number of adverse reactions. The most common untoward effects are gastrointestinal disturbances (nausea, vomiting, anorexia), cardiovascular effects (orthostatic hypotension, minor disturbances of cardiac rate and rhythm, flushing), psychic reactions, and involuntary movements. Precautions in the administration of the drug, pharmacology, as well as dosage and preparations are discussed.—*Journal abstract.*

7289. Dewhurst, K. (Littlemore Hosp., Oxford, England) **Personality disorder in Huntington's disease.** *Psychiatry Clinica*, 1970, Vol. 3(4), 221-229.—The complex interaction of genetic and environmental influences in Huntington's disease results in successive generations (including those unaffected) living in deteriorating social circumstances. Their social decline may be due to incapacitating neurological sequelae, e.g., dementia, dysarthria, and ataxia, or it may arise from a concomitant psychiatric cause, e.g., a personality disorder often complicated by chronic alcoholism, criminality, or promiscuity. Such a nonspecific behavior disorder often precedes the classical neurological picture of Huntington's disease by about 10 yr., and it may appear in unaffected members of these families. The presence of severe personality disorders in 2 generations of a large Huntington's pedigree is described. A father and 2 sons (all of whom developed Huntington's disease) had premorbid personalities characterized by well marked behavior disorders. The fact that a 3rd brother (free from the Huntington's gene) together with 3 half-siblings from the same mother and an unaffected

father, all developed severe personality disorders suggests that adverse environmental factors rather than a deleterious gene, are more likely to cause a personality disorder.—*Journal summary.*

7290. DiGiacomo, Joseph N., Fahn, Stanley; Glass, Joel B., & Westlake, Robert J. (U. Pennsylvania) A case with Gilles de la Tourette's syndrome: Recurrent refractoriness to haloperidol, and unsuccessful treatment with L-dopa. *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 115-117.—A 38-yr-old patient with the characteristic symptoms of Gilles de la Tourette's syndrome including motor tics and explosive utterances had been treated with both psychotherapy and haloperidol. Haloperidol gave complete relief of symptoms, but after 5 yr. the symptoms returned despite increase in the dosage to 20 mg/day. The patient was admitted to a psychiatric ward, withdrawn from all medicines, and then treated with chlorpromazine at a level of 900 mg/day; in addition, L-dopa was started and increased to 6 mg/day over 7 wk. The chlorpromazine-L-dopa treatment produced no significant changes in symptoms. During the 8th wk., these medicines were discontinued and haloperidol was again started. Within 3 wk. of resuming haloperidol, all explosive utterances and tics were absent.—*Journal abstract.*

7291. Geschwind, Norman. (Boston City Hosp., Neurological Unit, Mass.) Current concepts: Aphasia. *New England Journal of Medicine*, 1971(Mar), Vol. 284(12), 654-656.—The apparently simple classification which most clinicians have been taught based on an expressive-receptive dichotomy is misleading and should be abandoned. The most important distinction in disorders of language output is between fluent and nonfluent aphasias. Patients with the latter produce little speech, which is uttered slowly with great effort and with poor articulation. By contrast, the patients with fluent aphasias produce well articulated, long phrases or sentences with a normal grammatical skeleton, having normal rhythm and melody. The speech is abnormal, however, since despite the many words produced, it is often remarkably devoid of content. The term "anomic aphasia" describes a fluent aphasia with essentially normal comprehension and repetition.—*S. R. Diamond.*

7293. Luriya, A. R., Kononov, A. N., & Podgornaya, A. Ya. Rasstroistva pamyati v klinike anevrizm perednei soedinitel'noi arterii. [Memory disturbances in anterior communicating artery aneurysms.] Moscow, USSR: Moscow U. Press, 1970. 121 p. 52 K.

7294. Minnigh, Els C. The changing picture of parkinsonism: II. The Northwestern University concept of rehabilitation through group physical therapy. *Rehabilitation Literature*, 1971(Feb), Vol. 32(2), 38-39, 50.—Describes a hospital's program of treatment for Parkinson's disease. Feeling that the individual approach was not only too limited, but actually served to reinforce the disabling effects, the new approach stresses group therapy, utilizing the combined efforts of the medical, nursing, physical, and occupational therapy staff. The goal is to emphasize independence throughout the hospital stay. This is in recognition of the fact that the administration of L-dopa may result in remarkable remission of physical symptoms but it does not influence motivation or dependency habits.—*S. L. Warren.*

7295. Samra, Khairy; Riklan, Manuel; Levita, Eric, & Cooper, Irving S. Psychological correlates of anatomically verified thalamic lesions in parkinsonians. *Journal of Nervous & Mental Disease*, 1971(Feb), Vol. 152(2), 96-105.—Studied parkinsonians who had undergone chemo- or cryothalamectomy and subsequently died of causes unrelated to surgery. Pathological study revealed that the surgical lesion affected mainly the ventrolateral nucleus of the thalamus. Lesion placement was found to involve largely pallidothalamic pathways, thalamocortical circuits, and thalamothalamic interconnections. Psychological correlates of lesion characteristics were based on pre- and postoperative ratings of behavioral status, with emphasis being placed on perceptual, cognitive, and emotional functions. It is suggested that postoperative psychological alterations accompany bilateral surgery more frequently than unilateral operations and appear related to changes in nonspecific and activating components of adaptive behavior. Moreover, the preoperative psychological status of a patient is more highly related to his postoperative psychological condition than to the site or size of the surgically imposed lesion centered in the ventrothalamic region.—*Journal abstract.*

7297. Van Dongen, H. R. & Van Harskamp, F. Een verkorte vorm van de W. A. I. S.: De waarde van het Doppelt I.Q. in een neurologische patiënten groep. [A shortened form of the W. A. I. S.: The value of the Doppelt I.Q. with a group of neurological patients.] *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Nov), Vol. 25(10), 665-667. Ss. 54 patients in a neurological clinic, were victims of brain tumors, strokes, atrophy, epilepsy and other neural defects. It was found that a correct prediction of the IQ scores on the complete WAIS could be found with the use of J. E. Doppelt's (see PA, Vol. 31:3024) short form of the WAIS in 61% of the cases with a standard error of 4 IQ points. It is concluded that the usage of the Doppelt test was justified with patients who tired early when administered the complete WAIS. *A. J. Ter Keurst.*

7298. Viukari, Matti. (Rinnekohti Inst. for Mentally Retarded, Majalampi, Finland) Brain function, carbon dioxide, anticonvulsants and tranquilizers, spinal fluid pH in brain diseases. *Behavioral Neuropsychiatry*, 1970(Dec), Vol. 2(9-10), 2-5.—Discusses the important role of carbon dioxide linked with potential of hydrogen (pH) for brain function in possibly regulating terminal oxidation and electron transport, and its resemblance to the action of anticonvulsants and tranquilizers. Little attention is paid to abnormal pH values found in spinal fluid in neurological diseases. Further observations of abnormally high spinal fluid pH values in mentally retarded epileptics are reported. It is suggested that it would perhaps be worth investigating pH, potential of carbon dioxide, bicarbonate, buffering capacity, glucose, and lactic acid in spinal fluid, and their correlations with EEG measurements in neurological and mental diseases. (28 ref.)—*Journal abstract.*

Brain Damage

7299. Burgess, Michael M., Kodanaz, Altan; Ziegler, Dewey, & Greenburg, Howard. (U. Missouri) Prediction

of brain damage in two clinical populations. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 523-532.—Examined 15 intellectual and 12 sensory motor variables as predictors of brain damage in 57 neurological and 68 psychiatric Ss. Results obtained via Student's *t* tests and multiple-regression analyses demonstrate that it is possible to predict brain damage in both clinical populations. Specific conclusions were: (a) as single predictor variables, sensory motor measures are superior to intellectual measures; (b) brain damage as measured behaviorally is consistent across the 2 populations; (c) there is a greater incidence of false positives in a psychiatric than a neurological population; and (d) multiple-variant prediction seems to hold promise for identification of brain damage. (16 ref.)—*Journal abstract*.

7300. Dominik, Witosława; Nowicka-Gawęcka, Halina, & Owsianowska, Teresa. (Medical Academy, Poznan, Poland) *Późne skutki psychologiczne zamkniętych urazów czaszki*. [Late psychological results of closed cranial injuries.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 191-204.—Examined 51 patients who had suffered brain concussion or confusion. Ss continued to complain of such symptoms as headaches, impoverished memory, and excessive sensitivity, often several years after the accident. Clinical tests and case studies were employed to evaluate Ss' conditions. It was found that in all cases several disturbances in the cognitive sphere (loss of memory and concentration, ability to plan and forecast) and the emotional sphere (sensitivity, the weakening of emotional control, depression) were present. It is suggested that the background for these disturbances may be organic damage to the CNS or disfunction in the adaptive mechanism appearing immediately after the injury. The advantages of the case study method for research of this type are discussed. (Russian summary)—*English summary*.

7301. Fowler, Roy S. (U. Washington, Medical School) *A simple non-language test of new learning*. *Perceptual & Motor Skills*, 1969(Dec), Vol. 29(3), 895-901.—Describes a paired-associate learning test which uses familiar household objects and is independent of spoken language. The test was patterned after the Wechsler Paired-Associate Learning Test (PALT) of the Wechsler Memory Scale. The Wechsler test has been used for many yr. to evaluate learning in brain-damaged Ss. It is, however, of no use when the S has a speech deficit. The object test was designed to be used when language deficits exist. 160 normal Ss were given both the PALT and the Non-Language Object Paired-Associate Learning Test. Ss were divided into 20 Ss of each sex in each of the following age groups: 30.6-40.5 yr., 40.6-50.5 yr., 50.6-60.5 yr., and 60.6+ yr. The tests were of comparable difficulty level. Norms are given. The object test is easy to give and should prove to be of considerable value in evaluating the new learning ability of brain-damaged Ss. (20 ref.)—*Journal abstract*.

7302. Kilpatrick, Dean G. (U. Georgia) *The Halstead Category Test of brain dysfunction: Feasibility of a short form*. *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 577-578.—Although the Halstead Category Test is one of the best indicators of brain dysfunction among the subtests of the Halstead-Reitan Neuropsychological Test Battery, it has been used infrequently by psychologists in clinical settings. The feasibility of a short form was considered. For the test protocols of 41 16-76

yr. old Ss the *r* for errors on odd items and total errors was .90, on even items and total errors, .99. Ss were all neurological or psychiatric patients, with the exception of 10 used to obtain local norms. The split-half correlation was .97. Research on the discriminative power of a short form was discussed; a short form is apparently feasible for use by the psychologist.—*Journal abstract*.

7303. Lansdell, H. (National Inst. of Neurological Diseases & Stroke, Bethesda, Md.) *A general intellectual factor affected by temporal lobe dysfunction*. *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 182-184.—Attempted to compute the general factor with loading on a variety of tests, and to demonstrate that the factor score estimates were related to the extent of the lesions regardless of side. The Differential Aptitude Tests and the Wechsler-Bellevue Intelligence Scale were utilized as instruments. "Extent of surgery, or neuropathology, on the left was related to scores on the verbal factor and on the right to scores on the speed factor: the relation to scores on the general factor was independent of side of lesion."—E. J. Kronenberger.

7304. Luria, A. R. *Metody issledovaniya vysshikh korykovykh funktsii pri lokal'nykh porazheniyakh mozga (sindromnyi analiz)*. [Methods for examination of higher cortical functions in local lesions of the brain (syndromic analysis).] In A. R. Luria, "Vysshie korykovye funktsii cheloveka i ikh narusheniya pri lokal'nykh porazheniyakh mozga." (See PA, Vol. 44:16023) 303-460.—Considers the methods of examination employed particularly those of neuropsychology, in cases of local lesions of the brain: preliminary conversation with the patient followed by the presentation of examination procedures in cases involving (a) motor functions, (b) audiomotor coordination, (c) higher cutaneous-mesthetic functions, (d) higher visual functions, (e) memory processes, (f) impressive speech, (g) expressive speech, (h) writing and reading, (i) arithmetic, and (j) thought processes. 28 pertinent figures and tracings are included along with illustrative materials incorporated into the text.—J. D. London.

7305. Luria, A. R. *Narusheniye vysshikh korykovykh funktsii pri lokal'nykh porazheniyakh mozga*. [Impairment of higher cortical functions in local lesions of the brain.] In A. R. Luria, "Vysshie korykovye funktsii cheloveka i ikh narusheniya pri lokal'nykh porazheniyakh mozga." (See PA, Vol. 44:16023) 81-302.—Considers in great experimental and theoretical detail a number of major topics: (a) some fundamental problems in research on higher cortical functions in local lesions of the brain, (b) impairment of these functions in temporal lesions, (c) their impairment in occipital and occipito-parietal lesions, (d) their impairment in sensorimotor lesion, and (e) their impairment in frontal lesion. Included are the latest advances in the subject, and an illumination of "the basic facts" of the new discipline of neuropsychology. 83 pertinent drawings and tracings, exclusive of tables, are provided along with illustrative materials incorporated into the text.—J. D. London.

7306. Luria, A. R. *Vysshie korykovye funktsii cheloveka i ikh narusheniya pri lokal'nykh porazheniyakh mozga*. [Higher cortical functions in the brain and their impairment in local lesions of the brain man.] Moscow, USSR: Moscow U., 1969. 504 p. (2nd ed.)

7307. Obrzut, John E. & Thweatt, Roger C. (Northern Arizona U.) *An investigation of the Sherman Mental Impairment Test: A normative study*. *Journal of*

Clinical Psychology, 1971(Apr), Vol. 27(2), 224-225. —The Sherman Mental Impairment Test was administered to 100 Ss. The results noted were: (a) brain-injured children had a slower reaction score and found fewer letters than the brain-injured adults; (b) normal children had a faster RT score, and found fewer letters than their adult counterparts; (c) Sherman's cutoff scores can be applied to both children and adult groups when using the RT score; (d) the letter finding score adult norms cannot be applied to children; (e) some possibilities for misclassifying Ss were noted; and (f) accuracy of classification is not dependent upon the sex of the S.—E. J. Kronenberger.

7308. Simpson, C. Dene & Vega, Arthur. (Northwest Nazarene Coll.) **Unilateral brain damage and patterns of age-corrected WAIS subtest scores.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 204-208.

The WAIS was administered to 88 brain-damaged patients and 50 controls as a part of the Halstead-Reitan Neuropsychological Test Battery. Age-corrected WAIS subtest scores were used. A total of 11 unilateral brain-damage signs were identified. These signs were then applied to individual patient protocols and to previously reported data and the result indicated support for the use of the signs. "The possibility of using the results of the paired-comparisons procedure as a type of screening test for the presence of unilateral brain damage is promising." It is suggested that if 4 or more signs are present for either right- or left-hemisphere damage then a diagnosis may be made in that direction.—E. J. Kronenberger.

7309. Thonisen, Poul. **Benton-testen.** [The Benton Test.] *Skolepsykologi*, 1970, Vol. 7(3), 189-204.—Describes the Benton Revised Visual Retention Test for brain-damage. Its use in Denmark is recommended. P. Mylon.

Epilepsy

7310. Calcedo Ordóñez, A. (U. Cadiz, Medical School, Spain) **Epilepsia y contenido vivencial: A propósito de un caso de "dreamy state."** [Epilepsy and recalled content. In relation to a case of "dreamy state."] *Actas Luso-Españolas de Neurología y Psiquiatría*, 1970(Jan), Vol. 29(1), 43-50. Discusses the case of an 18-yr old male epileptic suffering from psychosensory ("dreamy state") crises, the symptoms of which included sleep walking, convulsions from an early age, and guilt and inferiority feelings due to family problems. By examining the recalled past experiences during these crises, the therapist was able to delve into the personal conflicts of the patient and aid him therapeutically. The S's family, professional, and medical problems were discussed during 15 sessions with the therapist. Further treatment entailed administering 2 tablets of trinitride h forte day, forbidding alcohol and exercise, restricting the intake of liquids, and taking many urine tests. Upon suffering 5 subsequent crises, the modification of the S's recalled past experiences was noted although the phenomenological structure of these crises still persisted. The case was observed over a 5-yr period. (English summary)—S. Maze.

7311. Geller, Martin & Christoff, Nicholas. (City U. New York, Mt Sinai School of Medicine) **Diazepam in the treatment of childhood epilepsy.** *JAMA Journal of the American Medical Association*, 1971(Mar), Vol. 215(13), 2087-2090. Treated 38 epileptic children with

a variety of seizure types with diazepam (valium) orally. The median duration of treatment was 2 yr. Dosages ranged from 3-60 mg/day depending upon patient tolerance and seizure response, although the usual effective dose was 15 mg/day. Seizure suppression was good to excellent in 29 children. The best results were seen in those with petit mal and other minor seizures. Side effects were few and usually limited to drowsiness. Diazepam is a very safe and effective long term anti convulsant in some seizure disorders of childhood. —*Journal abstract.*

7312. Lison, Michel P. (U. São Paulo, Medical Faculty of Ribeirão Preto, Brazil) **Crises tónicas axiais e crises acinéticas: Estudo clínico longitudinal de pacientes tratados com derivados benzodiazepínicos.** [Axi-tonic seizures and akinetic seizures: Clinical study of patients treated by benzodiazepines.] *Arquivos de Neuro-Psiquiatria*, 1970(Dec), Vol. 28(4), 347-356. Investigated the clinical changes of 2 Ss with axotonic seizures and 10 Ss with akinetic seizures treated by nitrazepam. Rapid reduction in frequency of the axotonic seizures occurred. The best result was obtained in 1 S with isolated seizures, resulting from an infantile myoclonic encephalopathy with hypsarhythmia abolished after 2 mo. of treatment. The other S presented the Lennox syndrome, there was decrease in intensity and frequency of other types of seizures which were occurring associated to the axotonic seizures but new types of seizures developed during the treatment. The occurrence of infectious processes aggravated the clinical picture of 1 S. Among the Ss with akinetic seizures, 5 presented rapid reduction in frequency and severity of seizures after the 1st day of treatment, in 4 Ss the seizures were abolished on the 1st day of treatment. Relapses or intensification of the clinical picture were observed in 5 Ss. The increase of dosage had an inconstant effect. (17 ref.)—*English summary.*

7313. Lison, Michel P. (U. São Paulo, Medical Faculty of Ribeirão Preto, Brazil) **Espasmos em flexão: Estudo clínico longitudinal de pacientes tratados com Nitrazepam (Mogadon).** [Massive spasms. Clinical study in patients treated by nitrazepam (mogadon).] *Arquivos de Neuro-Psiquiatria*, 1970(Dec), Vol. 28(4), 336-346. Investigated the changes of the clinical picture of 12 epileptic patients with massive spasms when treated by nitrazepam. Treatment was satisfactory in 11 patients. In 2 cases seizures were abolished after the 1st day; in 9 there was marked reduction of the intensity of spasms after the 1st day. It was observed that (a) spasms continued, although the amplitude and violence of muscular contraction were reduced, (b) partial seizures occurred in some patients, and (c) the massive aspect of myoclonia disappeared. The decreasing the repetitive tendency of the seizures. The time interval between the onset of massive spasms and the beginning of the treatment with nitrazepam did not influence the results obtained with nitrazepam. Partial seizures relapsed in 7 patients and were related to decrease of the drug or to infectious processes. Infectious processes of the respiratory tract were frequently seen after the beginning of the treatment. During the treatment 7 patients developed generalized seizures for the 1st time. Symptom and behavior changes were observed when the late tonic seizures developed, suggesting the installment of the Lennox syndrome. (18 ref.)—*English summary.*

7314. Loiseau, P. & Cohadon, F. (Hosp. Saint-André,

Cours d'Albret, Bordeaux, France) **Considérations sur les épilepsies partielles continues et leurs relations avec les épilepsies somato-motrices.** [Considerations concerning epilepsy partialis continua and its association with somato-motor epilepsy.] *Encéphale*, 1970(Jul), Vol. 59(4), 362-389.—Presents case observations of patients with typical Jacksonian and myoclonic seizures who have also evidenced epilepsy partialis continua (EPC). EPC is a form of epilepsy marked by clonic muscular contractions during the intervals which exist between major convulsions. Surgical intervention showed demonstrable evidence of causative factors: subdural hematoma in 1 case and advanced syphilis in another. Associations are made between EPC and somato-motor epilepsy on the basis of symptomatology and EEG findings in these 2 cases. Particular problems associated with the establishment of a diagnosis of EPC on the basis of EEG findings are discussed. (35 ref.)—P. R. Shibelski.

7315. Roth, G. (Vienna City Hosp., Neurological Clinic, Austria) **Epilepsia est morbus non possessio.** [Epilepsy is a disease and not a possession.] *Confinia Psychiatrica*, 1970, Vol. 13(1), 67-72.—Discusses a manuscript not yet edited (Codex cremifanensis No. 70) of the Benedictine Monastery (Kremsmünster, Austria), which was written before the year 1320 by the Friar Wernherus Medicus, and includes a chapter on epilepsy. The concept that epilepsy is a disease and not a possession, that it is to be treated with diet and purgation, not through exorcism, relates to the somatic interpretation of psychopathological conditions in the primary literature of the Middle Ages. (18 ref.)—*Journal summary*.

MENTAL RETARDATION

7316. Angenent, H. L. **A frame of reference in the observation of institutionalized subnormals.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 107-112.—Investigated which factors influence an institutional staff's judgments of—and therefore the education of—the institutionalized subnormal. Interviews with staff on the characteristics of 39 female and 61 male 8-21 yr. old slightly feeble-minded patients revealed 67 items. Ss were rated for the presence or absence of a particular behavior by 3 staff members. Analysis revealed 4 general factors which accounted for approximately 66% of the total variance: (a) intelligence, (b) vital and egoistic needs, (c) agreeableness, and (d) excitability. 2 other factors, sex and age, also increased the amount of variance accounted for to approximately 79%. The characteristics of each factor are described and briefly discussed. It is concluded that this model can aid in developing theories of treatment for mentally subnormal children.—S. Knapp.

7317. Bishop, Frank; Bass, Francesca, & Anderson, Eileen. (Royal Children's Hosp., Parkville, Victoria Australia) **The use of groups in the evaluation of mental retardation.** *Australian Journal of Mental Retardation*, 1970(Mar), Vol. 1(1), 23-26.—A group of trained personnel of different disciplines observed several groups of 6-8 children for a minimum of 4 observations of approximately 1½ hr. each. The team was to diagnose the difficulty of the child. Apparently no formal instructions were used to confirm the findings. 41 children were diagnosed. The advantages and disadvantages of the procedure are discussed. The following

assessments were made on each child: his awareness of other children and adults, to whom the child made approaches, how he approached others and his reactions, and the pattern of activity for the whole group. Parents also participated in the evaluation.—C. L. Nicholson.

7318. Brown, Joy A. (U. Northern Colorado) **The relationship of physical stigmata, intellectual functioning, and performance profile in mongolism.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3987.

7319. Christodorescu, D., Negulici, Eugenia; Zelingher, Roza, & Tăutu, C. (G. Marinescu Hosp. Bucharest, Romania) **Conversion reactions in Klinefelter's syndrome.** *Psychiatria Clinica*, 1970, Vol. 3(4), 230-340.—Reports 4 cases of Klinefelter's syndrome with conversion reactions. 1 patient was also a hysterical psychopath and another exhibited hysterical traits in the projective tests (Rorschach and TAT). The parameters of the personality of Klinefelter Ss predisposing them to the manifestation of functional disorders are discussed. (28 ref.)—*Journal summary*.

7320. Coleman, Richard. (U. North Carolina) **Klinefelter's syndrome: A review of the research.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 103-106.—Since H. Klinefelter's 1942 description of the syndrome bearing his name, further research has attempted to refine and expand his preliminary findings. Thus far histological and karyotyping studies have yielded equivocal results. Malignant neoplasm, diabetes mellitus, genetic factors, and maternal age have each been cited as etiologically related to Klinefelter's syndrome. While a discrepancy in incidence figures continues to exist, there has been general agreement that the highest frequencies have occurred at the upper limits of mental retardation. (24 ref.)—*Journal summary*.

7321. D'Akon, S. O. (U. New South Wales, School of Sociology, Kensington, Australia) **Concepts of retardation in industrial society.** *Australian Journal of Mental Retardation*, 1970(Jun), Vol. 1(2), 38-39. Society views mental retardation with alarm, partly due to the industrial demands for production. This view is perpetuated by the belief that the IQ is definitive. Thus, the only way to rehabilitate the mentally retarded is within the productive form. The institution for the profound mentally retarded is regarded as being outside the society. There is much literature about the work that the mentally retarded can do, and there are lists of vocations for the mentally retarded. As a result, those defined as mentally retarded are devalued, as are those working with the mentally retarded.—C. L. Nicholson.

7322. Fong, Louella J. (Purdue U.) **Stimulus discriminability and color-form preference in normal and retarded children.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5019-5020.

7323. Gunzburg, H. C. **Symposium on "normalization": II. The hospital as a normalizing training environment.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 71-83.—Reports that only 20-30% of patients in hospitals for the subnormal actually need nursing and medical care. It is suggested that hospitals be reorganized to prepare the patients for more normal conditions. The need is discussed for (a) an operational philosophy, (b) multidisciplinary leadership, (c) a planned variety of different professional skills, (d) an integrated planning program relating to normal life practices, (e) an operational policy relating to work training, (f) involvement of nonclinical staff, (g) social

education in the institutional home, and (h) living units (where patients are prepared for community living). It is concluded that the institutional framework has more flexibility and potential for this work than traditions and practices have indicated. (15 ref.)—S. Knapp.

7324. Hasazi, Joseph E. (U. Miami) **The relationship of attentional, motivational, and visual-perceptual variables to response latency in developmental retardates.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5623-5624.

7325. Heaton-Ward, W. Alan. (Stoke Park Hosp. Group, Bristol, England) **The role of the hospital in the mental subnormality service.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 57-61.—Considers the criticisms of hospitals for the mentally subnormal and their staffs. The lack of an integrated service (where the hospital is part of the community service) is considered a major barrier in the improvement of facilities. The need for (a) assessment as an ongoing process; (b) long-term, short-term, and day care; (c) multidisciplinary teams; (d) revised nurses' training programs; (e) smaller institutions; and (f) a larger psychiatric staff are discussed. The increase in volunteers is described as reducing some of the barriers between the hospitals and the community.—S. Knapp.

7326. Kindberg, Margaret N. (Ohio State U.) **Imitation of a peer model by severely retarded institutionalized boys.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5605-5606.

7327. Lucker, William G. (George Peabody Coll. for Teachers) **The effects of environmental stimulation on the perceptual thresholds of high-active and low-active mentally retarded persons.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5031.

7328. MacMillan, Donald L. & Keogh, Barbara K. (U. California, School of Education, Riverside) **Normal and retarded children's expectancy for failure.** *Developmental Psychology*, 1971(May), Vol. 4(3), 343-348.—Administered a series of block designs, $\frac{1}{3}$ of which were interrupted prior to completion to 60 normal and 60 retarded children. Ss were divided among 3 instructional conditions which defined interruption as success, failure, or neutral. Repetition choice was noted and Ss were asked why certain tasks had not been finished. Interruption was perceived differently by normals and retardates. Retardates perceived interruption as personal failure, normals did not. Although retardates exhibited a success orientation on repetition choice under the success condition, interruption was still seen as due to personal inadequacies.—*Journal abstract*.

7329. Mulhern, Thomas & Baumeister, Alfred A. (U. Cincinnati) **Effects of stimulus-response compatibility and complexity upon reaction times of normals and retardates.** *Journal of Comparative & Physiological Psychology*, 1971(Jun), Vol. 75(3), 459-463.—Compared the RTs of 40 male undergraduates and 40 retarded males across 5 levels of complexity and 2 of stimulus-response (S-R) compatibility. Stimulus complexity was varied between Ss and S-R compatibility within Ss. The main effects of intelligence, complexity, and compatibility were all significant, as were the Intelligence \times Complexity, Complexity \times Compatibility, and Intelligence \times Compatibility interactions. Results are discussed in terms of an information-processing deficit for the retardates.—*Journal abstract*.

7330. Nielsen, Bøgill. (Frekeriksgaard School, Copenhagen, Denmark) **Hjælpeklasselevers intelligens-**

struktur. [The structure of intelligence of borderline children.] *Skolepsykologi*, 1970, Vol. 7(3), 178-188.—Presents a descriptive and correlational study of borderline children in a special school. Boys have a more uneven structure and higher IQ than girls, who profit more from education.—P. Mylov.

7331. Nirje, Bengt. **Symposium on "normalization": I. The normalization principle: Implications and comments.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 62-70.—Describes the normalization principle as making available to the mentally subnormal, "patterns and conditions of everyday life which are as close as possible to the norms and patterns of the mainstream of society." 8 facets of such a process are discussed with implications and methods of implementation for the mentally subnormal: (a) normalization of their daily, weekly, and yearly rhythms; (b) normal developmental experiences of the life cycle; (c) respect for their choices, wishes, and desires; (d) normal bisexual contacts; (e) normal economic standards; and (f) normal standards of physical facilities. It is concluded that application of the normalization principle profoundly affects not only the retarded but also those who work with them, their parents, and society in general.—S. Knapp.

7332. Pedersen, Jens M. **The physical environment of the mentally handicapped: I. Progress in building for the mentally handicapped.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 121-125.—Reviews the interaction of the medical, educational, and therapeutic disciplines with architecture in designing buildings for the mentally retarded. An innovative development in Denmark using institutional homes with a single bedroom for each resident is described. Recommendations for rooms for 2-4 residents in the case of the very young or severely multihandicapped are presented. The use of the central institution as an educational, occupational therapy, and observational center with patients in outlying residences is suggested. A research project in progress on the physical environment of the mentally retarded is described. It is concluded that prompt feedback from new facilities is necessary to prevent future mistakes and to develop new designs for rapid implementation.—S. Knapp.

7333. Pitt, David; Fenner, Frank; Ferris, A. A., & Evans, Jack L. (Children's Cottages Training Center, Kew, Victoria, Australia) **Prevention of mental deficiency by control of infectious diseases.** *Australian Journal of Mental Retardation*, 1970(Mar), Vol. 1(1), 9-22.—Research indicates that of the retarded in institutions 5-6% are there from causes of infectious disease other than rubella. These are acquired pre- and postnatally. 4 factors play an important part in determining whether fetal infection is established: maternal immunity, effectiveness of the placenta, capacity of the fetus to react, and virulence. Increasing the mother's immunity and the betterment of her health decreases the chances of fetal infection. Progress in the reduction of viral infection is noted. Geographical differences in the rate of certain infections is noted. New evidence that hepatitis plays an important role in mental retardation is noted and discussed.—C. I. Nicholson.

7334. Pitt, David, et al. (Children's Cottages, Kew, Victoria, Australia) **Lead poisoning in retarded children.** *Australian Journal of Mental Retardation*, 1970(Jun), Vol. 1(2), 58-60.—Lead poisoning in children has been reduced, but not eliminated. Some studies

indicate a higher incidence of blood lead levels in mentally retarded children. Previously undetected lead poisoning may be a factor in the mental retardation of some children. This study investigated blood lead levels in 30 mentally retarded children of unknown etiology and 20 disturbed children. No abnormal levels were found in the disturbed Ss. Of the 30 retarded Ss, 21 had signs of brain injury and 6 of these had high blood lead levels. An extension of the study to 121 children with brain damage of unknown cause found 3 with high lead blood levels. Causes are discussed. Some were known to chew toys, which may have been a source of lead.—C. L. Nicholson.

7335. Smith, Meryl C. (Grosvenor Hosp., Summer Hill, New South Wales, Australia) **Residential care of the severely and profoundly retarded child.** *Australian Journal of Mental Retardation*, 1970(Mar), Vol. 1(1), 30-33.—Presents the basic philosophy of the care of the severely mentally retarded—they are not babies, but humans, and must be helped from dependency to as great a degree of independence as possible. The routine of the day is discussed, with the techniques of developing this independence. Methods of fullest utilization of personnel are discussed, as well as use and placement of buildings. Voluntary personnel utilization is presented. A day's activity program is outlined. The program described is now in operation at the Grosvenor Hospital in Australia.—C. L. Nicholson.

7336. Sternlicht, Manny; Pustel, Gabriel, & Deutsch, Martin R. (Willbrook State School, Staten Island, N.Y.) **Suicidal tendencies among institutionalized retardates.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 93-102.—Examined the records of 33 male and 12 female suicidal retardates, drawn from the largest institutional cross-section of retardates in the United States, for a number of variables: (a) statistical parameters, (b) psychological correlates, and (c) personality dynamics. Statistical parameters covered include (a) the incidence of suicidal behavior, (b) IQs, (c) CA and length of institutionalization, (d) diagnostic classification, and (e) methods of suicide. The home backgrounds, behavioral profiles, and psychological nature of the attempted suicides were examined to provide psychological correlates. A detailed psychological analysis of a mildly retarded suicidal girl is presented in an effort to discover the personality dynamics of the suicidal retardate. A theory of retardate suicide is proposed. (25 ref.)—*Journal summary*.

7337. Stubblefield, Harold W. (Clover Bottom Hosp. & School, Donelson, Tenn.) **On being a pastor to the mentally retarded.** *Journal of Pastoral Care*, 1970(Jun), Vol. 24(2), 98-108.—Discusses the pastor's approach to the mentally retarded in terms of understanding the world of the retarded, clarifying his own feelings about the retarded, and a willingness to be flexible and creative in his approach.—O. Strunk.

7338. Turner, Gillian. (Grosvenor Hosp., Summer Hill, New South Wales, Australia) **X linked mental retardation.** *Australian Journal of Mental Retardation*, 1970(Jun), Vol. 1(2), 61-62.—Although there are a number of X-linked diseases associated with mental retardation, there is also a form in which the outstanding feature is their somatic normality. From 2,000 records at 1 institution, 170 males fell into the category of mainly normal features except that they were retarded. These Ss and their case histories were examined, excluding those who had a history of fits, head circumference 2 cm. more

or less than average, height below the 3rd percentile, 1 major or 3 minor congenital abnormalities, presence of neurological signs, and history of encephalitis or meningitis. A total of 23 remained. These were examined and it was found that 4 had family histories of X linkage without retarded brother, but 60% had an affected retarded male relative. The implications for genetic counseling are evident in X-linked cases.—C. L. Nicholson.

7339. Zarfas, D. E. (Ontario Dept. of Health, Toronto, Canada) **Symposium on "normalization": III. Moving toward the normalcy principle in a large government operated facility for the mentally retarded.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 84-92. Describes a program for treating the mentally retarded in an institutional facility which emphasizes learning-living rather than nursing-medical principles. The unit system is used to delineate the types of patients involved and the services needed. The hospital, educational, activity, and adult training and rehabilitation units are briefly described. Personnel and training programs are outlined. The difficulties, reactions of the staff, and progress of the program from 1968-1970 is reported. It is concluded that the goal of normalization, while not being accomplished, is being approached.—S. Knapp.

Learning & Motor Ability

7340. Anooshian, Yurajan B. (U. Northern Colorado) **A comparison of two instructional techniques for improving balance in profoundly and severely mentally retarded boys.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3927.

7341. Beasley, Nigel & Hegarty, John. (U. Keele, England) **The use of the Touch-Tutor with S.S.N. children.** *Journal of Mental Subnormality*, 1970(Dec), Vol. 16(31, Pt. 2), 113-118.—Studies learning in 35 male and female severely retarded 8-19 yr. olds using the Touch Tutor developed by A. Cleary and D. Packham (see PA, Vol. 43:14750). Ss were assigned to 1 of 4 teaching conditions in which (a) 1-, 2-, and 3-choice slides were presented progressively or mixed; and (b) the machine repeated the correct response and advanced to a new slide after correct or incorrect responses or advanced to a new slide only after the correct response, which the machine did not repeat. Data indicate that there were no significant differences in pre- and posttest scores for Ss in any of the groups, although 18% were able to match-to-sample before and after the program. It is concluded that a small number of severely retarded children can use machines employing match-to-sample but that further research is necessary before they can be introduced into the classroom.—S. Knapp.

7342. Berry, Franklin M., Joubert, Charles E., & Baumeister, Alfred A. (Columbus Coll.) **Single-letter cue selection and degree of paired-associate learning in retardates.** *Journal of Experimental Psychology*, 1971(May), Vol. 88(2), 196-204.—Trained 70 Ss from a residential institution for the retarded on redundant-stimulus paired associates (PAs) tasks in which the stimuli were trigrams and the responses single digits. Ss were response-pretrained and randomly assigned to 7 different groups: experiencing a different level of PA learning: 1, 2, 3, 5, 7, 2 perfect, or 8 overlearning trials. Ss were tested for digit recall to each letter from the trigrams presented singly, and performance was scored

according to either a single- or double-criterion method. Both of these modes of analysis showed 1st letters to be better recall cues than the other 2 (after 2 perfect trials) and a large increase in the effectiveness of 3rd letters after 8 overlearning trials. However, single-criterion scoring indicated that the amount of single-letter selection increased across trials, but the double-criterion scoring revealed that it was actually 2-letter usages which were more frequently employed with increasing degrees of PA learning. (17 ref.)—*Journal abstract*.

7343. Craft, James E. (Baylor U.) **Verbal paired-associate learning by educable mentally retarded and normal children.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-A), 3949.

7344. Etaugh, Claire F. (Bradley U.) **Factors in learning stereometric discriminations in children.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 614. —Tested 30 retarded and 30 normal children in a 2-choice size-discrimination task to determine if young children form discriminations more rapidly with stereometric objects than with pattern stimuli. Findings support the importance of depth cues in the mastery of stereometric discrimination tasks, at best for 2-choice problems.—*P. Hertzberg*.

7345. Hayes, Charles S. (U. Iowa) **The frustration effect in normal and retarded children as a function of rewarded pretraining.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5624.

7346. Logan, Mary M. (U. Arizona) **The effects of type of reinforcement and source of reinforcer selection on institutionalized mental retardates.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5001.

7347. O'Connor, Colleen. (Texas Technological U.) **Day-to-day difference between dominant and non-dominant grip strength in preschool children.** *Perceptual & Motor Skills*, 1970(Apr), Vol. 30(2), 676. —Investigated the nature of bilateral asymmetry of grip strength with 10 normal and 10 retarded right-dominant preschoolers who performed 6 isometric contractions of each hand on each of 2 different days. The nondominant hand was more vulnerable to fatigue, while the dominance of right-grip strength was emphasized. A format for investigations to compare and evaluate N. C. Kephart's bilateral training hypothesis and C. H. Delacato's unilateral notion for the development of lateral dominance is suggested.—*P. Hertzberg*.

7348. Schaeffer, Richard F. (Florida State U.) **Errorless establishment of discrimination learning sets in retarded children using fading procedures.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5640.

7349. Touchette, Paul E. (Massachusetts General Hosp., Boston) **Transfer of stimulus control: Measuring the moment of transfer.** *Journal of the Experimental Analysis of Behavior*, 1971(May), Vol. 15(3), 347-354. —3 severely retarded adolescent boys acquired simple form discrimination errorlessly. Each was 1st taught to press a red key vs. a simultaneously present white key. After this discrimination had been established, black figures were superimposed on the red and white keys. Each correct response affected the next trial by delaying the onset of the red stimulus an additional .5 sec. Transfer of stimulus control to the figures was indicated when Ss responded correctly before the onset of the red stimulus. A series of errorless discrimination reversals was accomplished with this technique, during

which the number of trials to transfer systematically decreased with successive reversal. (19 ref.)—*Journal abstract*.

7350. Turnure, James E. (U. Minnesota) **Reactions to physical and social distracters by moderately retarded institutionalized children.** *Journal of Special Education*, 1970(Sum), Vol. 4(3), 283-294. —Investigated the orienting behavior of mentally retarded children under a variety of conditions, all involving a discrimination learning task. In Exp. I, the data from these Ss were compared with those available from a previous investigation which involved normal Ss of comparable MA and CA. It was found that, in many cases, the normal Ss showed nontask orientations to a greater degree than did the retarded Ss. An examination of those circumstances under which the retarded glanced more often indicated that these circumstances, often observed in the classroom, are inappropriate for adjudging retardates to be distractible. Exp. II added a social agent to the conditions for task performance, using Ss from Exp. I. The presence of an adult in the learning situation greatly increased nontask orientations. However, it was also shown that if cues are provided by the adult, they will be utilized by the Ss so that their glancing apparently represented information-seeking and not merely vacuous orientations to a salient social stimulus. Exp. III, using naive Ss, replicated the pattern of results found in Exp. II.—*Journal abstract*.

Training & Vocational Rehabilitation

7351. Bowersock, Roger B. (Florida State U.) **Effects of verbal, vicarious, and monetary reinforcement on the verbally stated interests of three rehabilitation clients.** *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-A), 4450-4451.

7352. Farrell, K. M. (Commonwealth Center, Melbourne, Victoria, Australia) **Problems of work placement for the mentally deficient.** *Australian Journal of Mental Retardation*, 1970(Mar), Vol. 1(1), 27-29. —Discusses the difficulty of placement in occupations for the mentally retarded. A description of the Australian Government employment services is given. Characteristics of the mentally retarded should be explained to the prospective employer. Many vocations are suitable for the mentally retarded with only some modification of routine, equipment, or technique. There are several positions the mentally retarded can fill, and some of these are listed. The need for vocational assessment and evaluation of the mentally retarded is emphasized. The role of the parents is discussed. Several problems of employment are highlighted, and possible approaches to their prevention and solutions are discussed.—*C. L. Nicholson*.

7355. Neale, Marie D. (Monash U., Clayton, Victoria, Australia) **Elwyn Morey memorial lecture: Human**

potential. *Australian Journal of Mental Retardation*, 1970(Mar), Vol. 1(1), 4-8.—With norms and averages, there are deviances, at both extremes. The norms and standards are important as objective guides, but subject to fluctuations. Social scientists warn that we are moving toward a 2-class automated society—the essential and surplus citizens. An interdisciplinary team approach offers a means of reducing the number of surplus citizens by assaying their potential and fitting these citizens into society. Learning potential and educational achievement must be increased. The mental health of the individual is important in developing his potential. Therapy and rehabilitation to improve the mentally handicapped are discussed. General theoretical considerations of IQ scores are mentioned.—C. L. Nicholson.

7356. Van Der Maren, Jean M. (U. Louvain, Center of Psychodiagnostic Research & Psychological Consultation, Belgium) *Enquête a propos de 14 métiers et des capacités opérationnelles préalables à leur apprentissage par des adolescents handicapés mentaux.* [Inquiry about 14 professions and the learning operational capacities among mentally handicapped adolescents.] *Psychologica Belgica*, 1970, Vol. 10(2), 225-246.—Examines the question of specific abilities necessary for successful training of mentally handicapped adolescents. On the basis of a nondirective discussion with educators, a list of 61 professional requirements was elaborated. In the next stage, about 20 people, educators and employers, from each of the 14 professions selected judged the necessity of a given professional requirement for the respective jobs. An index of necessity was calculated for each of the requirements and jobs, classifiable into 4 categories: useless, accessory, required, and essential. Results show that professional abilities are more important for various forms of training than academic knowledge. Discrepancies between judgments of educators and employers are discussed. (English abstract) (26 ref.)—S. Slak.

PHYSICAL ILLNESS

7357. Abaffy, Mária & Takács, Judit. *Pszichológiai megfigyelések és tapasztalatok egy gyermekosztályon.* [Psychological observations and experiences in a pediatric ward.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(3), 415-421.—In the internal medicine ward with 40 beds in the Budapest Regional Pediatric Hospital, 780 patients over 3 yr. of age were treated during a 14-mo period. Psychological examinations were made in 200 cases, whenever the physician in charge of the case requested it. Results of examinations were considered and utilized in the course of subsequent physical examinations, treatment, and counseling. (Russian summary) (17 ref.)—English summary.

7358. Beard, Bruce H. (U. Oklahoma, Medical School, Oklahoma City) *The quality of life before and after renal transplantation.* *Diseases of the Nervous System*, 1971(Jan), Vol. 32(1), 24-31.—Reports the evaluation of 5 patients from a larger group previously studied, who had experienced renal failure, maintenance hemodialysis, and kidney transplantation. The study focused on the quality of life during the hemodialyses period prior to transplantation and up to the 1st 9 mo. following transplantation. "Repeated psychiatric interviews were conducted with each S, and specific note was made of each S's attitudes about self-esteem, relationships with family members, concept of values, areas of

active participation with his environment, and attitudes about his life prospects. Brief case reports are included for each patient. It was found that the quality of life experienced by the 5 Ss was "seriously marred" by their uncertain and unfulfilling existence. Although center hemodialysis prolonged their lives, it did not provide an acceptable existence. Ss were preoccupied with the fear of death, saw themselves as severely handicapped, and suffered damage to their self-esteem. Only those 2 Ss who reached the 9-mo posttransplant point experienced hope of returning to a normal existence. —P. McMillan.

7359. Bridgford, Margret H. (U. Colorado) *Self-conception and social rehabilitation of kidney transplant patients and chronic hemodialysis patients.* *Dissertation Abstracts International*, 1971(Mar), Vol. 31(9-B), 5615.

7360. del Dowiakowski, M. L. & Luminet, D. *Etude psychosomatique de 32 cas d'infarctus du myocarde.* [Psychosomatic investigation of 32 cases of myocardial infarction.] *Acta Neurologica et Psychiatrica Belgica*, 1969(Feb), Vol. 69(2), 78-89.—Presents a psychosomatic study of 32 male patients (under the age of 46) who sustained myocardial infarctions without having had any prior symptoms of hypertension. Ss were questioned, during 30-60 min. interviews, regarding attitudes concerning their fathers' occupational and educational backgrounds. Results show that 20 Ss had achieved more education and 14 Ss a higher level of occupational status than their fathers. All Ss described their fathers as being dominating, castrating, and perfectionistic. It was concluded that "the object relationships of the coronary patient are of a pregenital nature; the pseudo-identificatory investment of the father, through work, does not allow for any valid resolution of the oedipal problem. The coronary accident corresponds to a breakdown of this attempt at functional identification." (German & English summaries) (26 ref.)—P. R. Shibelski.

7361. Drunkenmölle, C. (Martin Luther U., Medical Clinic & Polyclinic, Halle-Wittenberg, E. Germany) *Klinische und neurosenpsychologische Untersuchungen bei funktionellen akralen Durchblutungsstörungen.* [Clinical and neurotic-psychological investigations with functional peripheral circulatory disorders.] *Psychotherapy & Psychosomatics*, 1969, Vol. 17(5-6), 343-353.—Examined peripheral circulatory disorders in terms of organic and emotional etiological factors in 19 male and 5 female 21-54 yr. old Ss. Organic factors were investigated via peripheral rheography. Ss had a mean symptom duration of 10 1/2 yr. All Ss exhibited symptoms of spasm on rheography. Psychological factors were assessed via a questionnaire developed and used by the psychiatric department of the Berlin hospitals. Results of analysis of responses to the questionnaire show that Ss rated themselves as having an average of 10 physical and 9 psychological symptoms. The most common physical symptoms were migraine (13 Ss), tachycardia (11 Ss), and sexual disturbances (10 Ss), while the most common psychological symptoms were self-esteem anxiety states (10 Ss), inhibitions (9 Ss), poor self-esteem (9 Ss), and depressive states (9 Ss). The MMPI was administered to 22 Ss. Results show that all but 2 Ss exhibited a neurotic personality structure. (English summary) (47 ref.)—English summary.

7362. Fellner, Carl H. & Schwartz, Shalom H. (U. Wisconsin, Medical School) *Altruism in disrepute: Medical versus public attitudes toward the living*

organ donor. *New England Journal of Medicine*, 1971(Mar), Vol. 284(11), 582-585.—Examined how willing people actually are to donate a kidney to a stranger. Written questionnaires were administered to a random sample of 116 adults in a Midwestern city of 175,000 population. There is much evidence that the medical profession looks upon the motivation of the living organ donor with distrust and suspicion. If he is genetically related to the recipient, it is the family who is suspected of exerting undue pressure. If he is unrelated and not connected to the recipient by any emotional ties, he is suspected of being mentally ill or emotionally unbalanced, and almost all transplant centers will exclude him a priori from donation. By contrast, a substantial proportion of the public, especially among the young and well educated consider the use of the living organ donor—even for saving a stranger—to be a reasonable procedure and one for which they themselves might volunteer. Results of the questionnaire indicate that intentions to donate appear to ensue from a "desire to fulfill one's sense of moral obligation, regardless of intensity of guilt feelings."—*Journal abstract*.

7363. Frost, J. Ormond & Miller, Maurice. (New York U., Medical School) Vestibular function and hearing in children with prenatal rubella. *New York State Journal of Medicine*, 1971(May), Vol. 71(9), 971-973.—Studied the vestibular responses to caloric testing in 99 children with proved or suspected prenatal rubella. It was found that prenatal rubella can and frequently does cause impaired vestibular function, as found in 41% of the Ss. Of the 64 children in whom pure-tone audiograms could be obtained, 1/2 had impaired vestibular response while 1/2 had hearing loss. While hearing is more likely to be normal when vestibular function is normal and more likely to be impaired when vestibular response is impaired, the trend is not strong enough to make vestibular function a dependable basis for predicting hearing status. *Journal summary*.

7364. Gay, Richard L. (Michigan State U.) The relationship between psychopathology and cancer. *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 4992.

7365. Heller, Stanley S., et al. (Columbia U., Coll. of Physicians & Surgeons) Psychiatric complications of open-heart surgery. *New England Journal of Medicine*, 1970(Nov), Vol. 283(19), 1015-1020.—Clinical observation suggested that the prevalence and severity of postcardiotomy delirium had declined in recent years. It was reasoned that a comparative analysis of a current with an earlier sample would document this decline and perhaps aid in understanding the etiology of the delirium. 89 patients were selected at random from the adult operative schedule. In 67% mental status remained clear. The frequency of delirium preceded by a lucid clear postoperative interval declined from 38% in 1965 to 24% in 1969. In 9% there was an immediate organic brain syndrome. Decreased time required on cardiopulmonary bypass appears to be a primary factor in the reduction of frequency. Modifications in the environment of the recovery room after open-heart surgery may also have contributed to the decline. (15 ref.)—*Journal abstract*.

7366. Jenkins, C. David. (U. North Carolina, School of Public Health, Chapel Hill) Psychologic and social precursors of coronary disease: I. *New England Journal of Medicine*, 1971(Feb), Vol. 284(5), 244-255.—Reviews the literature from 1965-1969 on etiology

and modes of prevention of coronary disease. Studies relating social variables to coronary disease have been particularly fraught with contradictions. Evidence points to social mobility and status incongruity as greater than expected precursors of coronary disease. Before their illness patients with coronary disease differ from persons who remain healthy on several MMPI scales, particularly those in the "neurotic triad." Those developing coronary disease tend to report greater stress and tension. (96 ref.)—S. R. Diamond

7367. Julien, C. G. Les manifestations psychiatriques de la maladie lupique. [Psychiatric manifestations of lupus] *Encephale*, 1970(Jul), Vol. 59(4), 291-312.—Reviews reports of the incidence of psychiatric manifestations in patients having lupus erythematosus. While most reports indicate a greater incidence of psychiatric manifestations in females and children, the reported incidence of psychiatric manifestations varies from 12-52%. Acute psychiatric manifestations include: confusional psychosis, frenzy, impaired intellect, agitation, disorientation to time and space, and memory impairment. The confusional state is accompanied by visual and auditory hallucinations lasting from several days to several weeks. Stuporous states accompanied by akinesia, mutism, and progression toward a terminal comatose state have been documented. Chronic psychiatric manifestations include anxiety states, emotional instability, mild confusion, obsessional thought, and psychosomatic symptoms. In some cases, actual schizophrenia (paranoid) has been documented. Predisposing factors include prepsychotic personality, CNS lesions, and high dosage steroid therapy. The adjunctive use of neuroleptics and rauwolfia alkaloids to counteract psychiatric manifestations induced by high dosage steroid therapy is discussed. (86 ref.) P. R. Shubelski

7368. Leger, J. M., Lauth, B., & Garon, R. Peut-on parler des psychoses thyroïdiennes? [Can one speak of thyroid psychoses?] *Annales Médico-Psychologiques*, 1970(Jul), Vol. 212, 246-256.—Improved radioisotopic identification methods have made possible a greater precision of observation of the association between thyroid gland dysfunction and a disturbed mental state. 5 patients were carefully studied from biological and psychological viewpoints and the characteristic states of apathy and passivity in myxedema and a clouded consciousness with profound anxiety in hyperthyroidism were confirmed. The mechanism by which the experience of each type of patient interacts with his physical condition is discussed to better understand the genesis of the troubled mental state. H. A. May

7369. Lennon, Beatrice E., Rekasch, Jerold H., Patch, Vernon D., & Howe, Louisa P. (Harvard Medical School, Boston, Mass.) Self-reports of drunkenness arrests: Assessing drinking problems among men hospitalized for tuberculosis. *Quarterly Journal of Studies on Alcohol*, 1970(Mar), Vol. 31(1-A), 90-96.—Tested the accuracy of patient's replies concerning the frequency of police arrests on drunkenness charges. Psychiatrists or police interviewed men concerning vocational and drinking history. In a population of 30 men, 44% revealed or acknowledged arrests for drunkenness. 34% truthfully stated that they had no such arrests and 22% concealed them. Men who acknowledge their arrests tended to have more arrests than those who concealed them. — of the men admitted for hospital treatment of tuberculosis had been arrested for drunkenness, and 41%

of the men with such arrests were readmissions. 78% of the men with drunkenness arrests were 45-59 yr. old on admission to the sanitarium, while such arrests had occurred in 57% of the men under 45 and in 58% of those age 60 or more.—S. R. Diamond.

7370. Marquis, Kent H. (U. Michigan) **Effects of social reinforcement on health reporting in the household interview.** *Sociometry*, 1970(Jun), Vol. 33(2), 203-215.—Tested the effects of interviewing procedures of social reinforcement used in conjunction with other special interviewer behaviors in a field interview setting. 6 white female inexperienced interviewers were given 1-wk training covering different techniques. Ss then interviewed 429 white females on their own and their husband's health. Morbidity reporting in household interviews was generally known to be subject to large omission errors. Reinforcement appeared to produce a 25% increase in the number of such health items reported, but did not affect the reporting of number of visits to a physician. Reinforcement effects were not limited to reporting a narrow class of health information but did facilitate the mention of a wide variety of sicknesses. (18 ref.)—*Journal abstract*.

7371. Olch, Doris. (U. Washington) **Personality characteristics of hemophiliacs.** *Journal of Personality Assessment*, 1971(Feb), Vol. 35(1), 72-79.—40 2-21 yr. old hemophiliacs showed some differences in personality from normals and many resemblances to other chronically ill persons on the Rorschach, Draw-A-Person, and stories made up to verbal cues. A single hemophilic personality, however, was not evidenced; though hemophiliacs suffer common physical problems, reactions to and modes of dealing with difficulties were unique. (25 ref.)—*Journal abstract*.

7372. Osborne, David. (Mayo Clinic & Mayo Foundation, Rochester, Minn.) **Age and sex differences on MMPI factor scales ER-O and EC-5 in a medical population.** *Journal of Clinical Psychology*, 1971(Apr), Vol. 27(2), 245-246.—MMPI data from a group of 50,000 Mayo Clinic patients were obtained. Males scored higher than females on the Ego Resiliency Scale (ER-O) and lower on the Overcontrol of Impulses Scale (EC-5). Equations for the transformation of raw scores to T scores were presented for the ER-O and EC-5 scales.—E. J. Kronenberger.

7373. Peterson, Marianne. (Washington State U.) **Birth order effects in juvenile patients with diabetes mellitus.** *Dissertation Abstracts International*, 1971(Feb), Vol. 31(8-B), 5004.

7374. Wishnie, Howard A., Hackett, Thomas P., & Cassem, Ned H. (Massachusetts General Hosp., Boston) **Psychological hazards of convalescence following myocardial infarction.** *JAMA: Journal of the American Medical Association*, 1971(Feb), Vol. 215(8), 1292-1296.—Emotional problems during convalescence from myocardial infarction seriously hamper rehabilitation and the return to work. Of the 24 male and female patients studied, 21 rated themselves as anxious or depressed and 18 were judged by the examiner to require either a tranquilizer or antidepressant. Sleep disturbances occurred in 15 patients and disruptive family quarrels over aspects of convalescence occurred in 18 cases. There was a uniform tendency to avoid taking sedatives, to minimize symptoms during follow-up examinations, and to retain harmful habits. 11 patients did not return to work; 9 for psychological reasons, and those who did resume part- or full-time employment

experienced anxiety or augmentation of angina or dyspnea or both. Suggestions are offered which may help to lessen the emotional hazards of convalescence. (18 ref.)—*Journal abstract*

7375. Wrześniewski, Kazimierz. **Osobowość a zawał serca.** [Personality and myocardial infarction.] *Przegląd Psychologiczny*, 1971, Vol. 1(21), 165-176.—Reviews studies concerning the relationship between personality structure and the formation of myocardial infarction. 3 types of opinions are distinguished: (a) there is a coronary personality; (b) there is not a coronary personality, but certain personality features may be typical of those who incur myocardial infarction; and (c) persons with coronary heart disease do not differ in personality from healthy individuals. It is concluded that a connection between personality and the development of heart disease can exist only through emotional states experienced. (Russian summary) (73 ref.)—*English summary*.

COMMUNITY SERVICES

7376. Berlin, Irving N. (U. Washington, Medical School) **Professionals' participation in community activities: Is it part of the job?** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 494-500.—Professional involvement in community mental health centers and other inner city agencies, especially schools, requires a new kind of professional collaboration and participation in the community's social and political processes. The questions of whether involvement can be professional, effective, responsive to changing community needs, and survive conflicting pressures, and of whether these skills be taught are considered. (15 ref.)—*Journal abstract*.

7377. Draper, Michael; Hillel, Jean, & Albert, Jean-Marie. (Inst. de Recherches Psychiatriques de Joliette, Quebec, Canada) **Outline for a priority research program in community mental health: The Bayonne project.** *Diseases of the Nervous System*, 1970(Nov), Vol. 31(11, Suppl), 175-179.—Describes plans for a sociological research project which involves the interrelationships between social, economic, and cultural factors and mental disorder in a semirural community. The project is planned as a cross-sectional investigation which will allow priorities to be scientifically established for program planning and lead to developments in community mental health.—P. Hertzberg.

7378. Heagarty, Margaret C., & Robertson, Leon S. (Cornell U., Medical Coll., New York, N.Y.) **Slave doctors and free doctors: A participant observer study of the physician-patient relation in a low-income comprehensive-care program.** *New England Journal of Medicine*, 1971(Mar), Vol. 284(12), 636-641.—Describes the drama of physicians in a comprehensive-care program groping toward egalitarian medical care. Egalitarian comprehensive medical care implies that everyone should have a personal physician capable of diagnosing the overall social and emotional context of disease as well as the disease itself. 12 postresidency fellows participated in this program during the 2-yr term of the experiment. The relation between middle-class physicians and lower-class patients is a drama in which staging can be blocked out by the lack of understanding of the conditions of poverty by the physicians, limited resources for communication by the patient, and misunderstanding of the meaning of manipulative actions by

both. A repertory company, rather than a single play including only the physician and the poor, seems advisable if the players are to carry out their roles effectively. (17 ref.)—*Journal abstract*.

7379. Hetznecker, William & Forman, Marc A. (Temple U., Health Sciences Center) **Community child psychiatry: Evolution and direction.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 350-370. —Considers sociocultural influences as preeminent in the development of community child psychiatry, with special emphasis on issues of social reform, race, and poverty. Current status of the field is discussed within the framework of a typology that identifies programs as being clinically adapted, socially adapted, or community adapted. (96 ref.)—*Journal abstract*.

7380. Tischler, Gary L. (Yale U., Medical School) **The effects of consumer control on the delivery of services.** *American Journal of Orthopsychiatry*, 1971(Apr), Vol. 41(3), 501-505.—A confluence of historical, social, and political forces has resulted in the emergence of increased pressure for community control over human resources, particularly in urban areas. A comprehensive mental health center's shift from institutional to consumer regulation is explored, and the impact of that transition upon the delivery of services is considered.—*Journal abstract*.

GERIATRICS

7381. de Ajuriaguerra, J., Steeb, U., Richard, J., & Tissot, R. **Processus d'induction dans les démences dégénératives du grand âge.** [Litigation of induction in the degenerative insanity of old age.] *Encéphale*, 1970(May), Vol. 59(3), 239-268.—Describes a study with a group of 18 degenerate patients, including old age home residents, factory workers, and young people of an elementary cultural level. The experiment involved induction of the law of balanced equilibrium, arbitrary laws, temporal succession law, and a probability law governing a contingent occurrence. Results indicate that deductive reasoning in the insane is far better preserved than inductive. Such patients are particularly handicapped when faced with induction of a rule in an unnecessary, predetermined event. The theory is confirmed that the aged do not adapt well to new occurrences or invention.—*I. Sirotnin*.

7382. Gottesman, Leonard E. (U. Michigan) **Organizing rehabilitation services for the elderly.** *Gerontologist*, 1970(Win), Vol. 10(4, Pt. 1), 287-293.—Nursing homes provide mostly basic and medical rehabilitation services and neglect psychosocial needs. Strategies for reorganization must take into account the influences on services of characteristics of the home itself, of its residents, its staff, the public it serves, and its administrator. Of these, the selection and training of the administrator is the most critical. (26 ref.)—*Journal abstract*.

7383. Lawton, M. Powell. (Philadelphia Geriatric Center, Pa.) **Institutions for the aged: Theory, content, and methods for research.** *Gerontologist*, 1970(Win), Vol. 10(4, Pt. 1), 305-312.—This search for a theoretical basis for institutional treatment of older people begins by acknowledging systems theory as a particularly useful conceptual background out of which to elaborate ideas about the interplay of society, the institution, and the aging individual. Some representative studies of institutions and institutional residents are

reviewed, and some methodological approaches to the study of institutions are suggested. (31 ref.)—*Journal abstract*.

7384. Lissitz, Samuel. (Robison Jewish Home, Portland, Ore.) **Theoretical conceptions of institutional and community care of the aged.** *Gerontologist*, 1971(Win), Vol. 10(4, Pt. 1), 298-304.—Presents an intensive review of some of the major theoretical concepts. The multidisciplinary nature of gerontology calls for more effective concepts. Such theoretical constructs can guide the training of research workers and practitioners. An attempt is made to formulate a Gestalt configuration theory that is based upon medicine, biology, sociology, psychology, and the other disciplines to interrelate more effectively the ego and the lives of the aged with their life space and subculture. Practitioners and research workers in gerontology need to think and to work in and on the 2 levels of theory and practice. Effective coexistence, but not peace, is desirable and is the goal of this paper. Here, stress assists the development of gerontology.—*Journal abstract*.

EDUCATIONAL PSYCHOLOGY

7386. Allen, Dwight W. (U. Massachusetts) **The seven deadly myths of education.** *Psychology Today*, 1971(Mar), Vol. 4(10), 70-72, 100.—Present educational institutions are dominated by several myths. These myths include beliefs that (a) children are stupid until taught, (b) rationality is good and emotions bad, (c) there is 1 best way to teach, (d) knowledge is stable, (e) learning only occurs in schools, (f) technology can rescue education, and (g) teachers should not be individuals. Alternatives could be developed if 10-15% of present budgets were allotted to voluntary experimental systems free of state and local control.—*E. J. Posavac*.

7387. Bardon, Jack I. (Rutgers State U.) **The internship of a middle aged industrial-school-clinical-community-developmental psychologist.** *Psychology in the Schools*, 1971(Jan), Vol. 8(1), 5-15.—This presidential address to the Division of School Psychology describes the problems encountered in recruiting psychological personnel for a corporation whose major enterprise was the establishment of preschool service centers across the United States. Recruitment became a problem because most psychologists viewed the concept of education as a product with much disdain. Based on this experience, new insights into the role of school psychologist are presented. *H. Kaczkowski*.

1969(Win), Vol. 15(4), 27-37. Attempted to determine whether students from a liberal arts college are different from those at a state university. Test scores of the MMPI were used and then interpreted in terms of personality characteristics. (16 ref.)—*M. B. Merk.*

7391. Ellert, JoAnn C. **The Gerstmann syndrome: A caveat regarding its classroom use by the reading teacher.** *Journal of the Reading Specialist*, 1968(Dec), Vol. 8(2), 73-75, 78-80. Studied the Gerstmann syndrome and the validity of its use in the classroom on a developmental basis. The Gerstmann syndrome comprises finger agnosia, dysgraphia, dyscalculia, and right-left disorientation which points to a lesion of the left angular gyrus. Presently, there is scepticism about the Gerstmann syndrome. The Gerstmann syndrome is used as a screening device in the classroom to identify those children who are backward readers because of a cerebral cortical defect. As a result of experiments, difficulty in finger differentiation occurred 3 times more often among dyslexics than normal children. The association of finger agnosia with poor arithmetical accomplishments has also been suggested. It appears that the developmental use of the syndrome in the classroom may still serve a useful purpose in identifying backward readers who may have a cerebral cortical deficit. (20 ref.)—*A. M. Farfaglia.*

7393. Harris, Linda S. (Stanford U., Inst. for Communication Research) **Readership study of the "Review of Educational Research."** *Report of the Institute for Communication Research, Stanford U.*, 1969(Feb), 88 p. Analyzed the responses of 572 members of the American Educational Research Association to a questionnaire concerning their use of and suggestions for improvement of the *Review of Educational Research*. Respondents were teachers, administrators, consultants, and researchers. 44% had PhDs and most were authors of journal articles, as well as active readers of other journals. Ss proposed changes to improve the writing style, editorial quality, and scope of the *Review*. 50% indicated a preference for an annual review rather than the current review. Overall use of the *Review* was found to be moderate, partly because the educational researcher tends to read issues only in his areas of specialization. Respondents indicated the *Review* to be useful in stimulating (a) current awareness, (b) learning about areas peripheral to one's specialty, and (c) information-seeking in connection with publications cited. Recommendations for changes in format and content are included.—*Journal abstract.*

49-111.—The simulation package is intended to provide a large group of students with a "controlled set of observations in a community and its schools." Because secondary school teachers are primarily concerned with 1 subject area, "the activities, problems, and experiences one wishes to simulate have to be of the nature that all secondary teachers would find of importance." Discussed are materials which deal with selecting a community in which to teach, analyzing the secondary schools as to their appropriateness for the individual, identifying important factors concerning the beginning teacher which are of import to the administrators in the school district, dealing with the parental involvement in the curriculum, working with underachievers, developing a rationale for choice of particular teacher organizations, and making decisions concerning student misconduct of a serious nature.—*I. Linnick.*

7416. Griggs, Joe W. & Bonney, Merl E. (Educational Research Council of America, Cleveland, O.) **Relationship between "causal" orientation and acceptance of others, "self-ideal self" congruency and mental health changes for fourth and fifth grade children.** *Journal of Educational Research*, 1970(Jul), Vol. 63(10), 471-477.—Hypothesized that as children gain in understanding human behavior they (a) are more accepting of others, (b) develop greater self-ideal self congruency, and (c) perform better on a mental health analysis test. A program in "causal" understandings was taught to 232 4th-5th graders in 2 separate communities.

Sociometric changes for experimental Ss were highly significant ($p < .001$ in Community A and $p < .02$ in Community B) supporting the 1st hypothesis. Although no other significant differences were noted, experimental Ss showed greater self-ideal self congruency and performed better on the mental health test. Recommendations for the teaching of causal understanding in the schools are presented.—*Journal abstract*.

7422. Katkin, Steven & Weisskopf-Joelson, Edith. **Relationship between professed values and emotional adjustment of college students.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 523-528.—Administered a test measuring 9 values, 5 relating to either dependency or individualism, to 94 male and 115 female undergraduates. Self-interpretation, self-actualization, and achievement were the individualistic values; relationship and support were the dependent values. Based on the Kleinmuntz College Maladjustment Scale and the Goldberg index of the MMPI, Ss were divided into 4 adjustment levels. 3 values differed significantly among the adjustment groups: self-interpretation, relationship, and achievement. There was a significant linear trend for each value, indicating an increase in adjustment level as preference increased for the 2 individualistic values and a decrease in level as preference increased for the dependent value. A comparison of adjustment groups' most frequently preferred value yielded results consistent with these findings. Results suggest that there is a relationship between value deviance and adjustment.—*Journal abstract*.

7426. Maier, Norman R. & Casselman, Gertrude G. (U. Michigan) **Problem-solving ability as a factor in selection of major in college study: Comparison of the processes of "idea-getting" and "making essential distinctions" in males and females.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 503-514.—Attempted to relate problem solving and academic major among 331 male and 281 female undergraduates through the use of 5 insight problems measuring 2 problem-solving processes: (a) generating the necessary idea for solution (idea-getting), and (b) making a distinction which prevents accepting a wrong answer as correct (making essential distinctions). Males scored significantly higher than females over-all, and in 4 of 9 subject matter groups. For both sexes, the mean for the physical science group was significantly higher than for the remaining groups (except the male biological science group). For the total population, although men scored significantly higher on both types of problems, women did better on the "idea-getting" problems than on those that require "making essential distinctions." Possible reasons for the superior performance of Ss in certain majors are discussed, as is the seemingly stable phenomenon of superior male ability in problem solving. (18 ref.)—*Journal abstract*.

7429. Nelson, Paul C. & Phares, E. Jerry. (Kansas State U.) **Anxiety, discrepancy between need value and expectancy, and internal-external control.** *Psychological Reports*, 1971(Apr), Vol. 28(2), 663-668.—Assigned 42 undergraduates to 3 groups differing in degree of internal-external control. Ss completed measures of anxiety, need value in the academic recognition area, expectancy for success in the academic area, need value in the area of love and affection, and expectancy for success in the love and affection area. Tests administered included Rotter's Internal-External Scale and the Academic Internal-External Scale. All measures were paper-and-pencil ones and were administered in an academic setting. It was predicted and generally demonstrated that external control of reinforcement is associated both with greater anxiety and with the discrepancy between need value and expectancy in the academic area. As expected, similar relationships did not obtain for the love and affection measures. Similarities between the anxiety and academic discrepancy scores are noted. (24 ref.)—*Journal abstract*.

7443. Caldwell, Mark B. & Knight, David. (Converse Coll.) **The effect of Negro and white examiners on Negro intelligence test performance.** *Journal of Negro*

Education, 1970(Spring), Vol. 39(2), 177-179.—15 male 6th grade Negro pupils were selected from 2 Negro elementary schools in a Southern city of 75,000. They were matched on grade level and scores on the CTMM and randomly assigned to 1 of 3 groups (A, B, or C). Using the revised Stanford-Binet Intelligence Scales, Group A was administered Form L by a Negro female followed by Form M by a white male within 1 wk. Group B was given the test in the same order with "a white examiner giving Form L and a Negro examiner giving Form M." Group C was administered both forms by "the white examiner." Using analysis of variance, results indicate no significant differences between groups at the .05 level. It is concluded that race of E administering the Binet is not a critical variable.—W. E. Sedlacek.
